Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.
+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.
+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.
+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

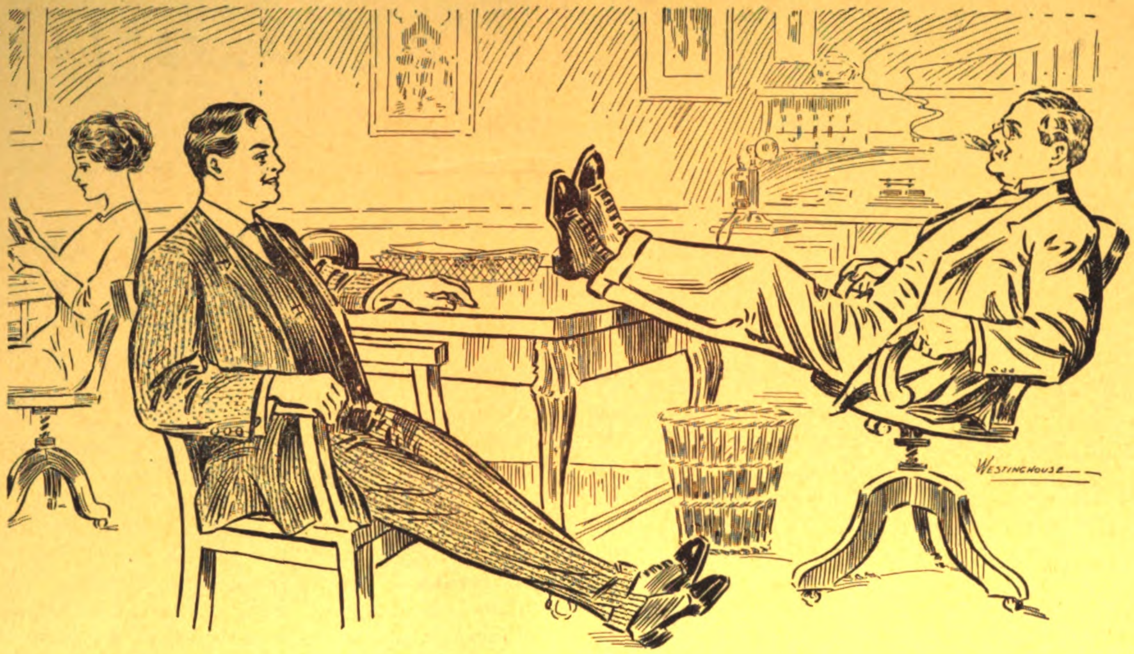
After six years service

The bonding car which electrically welds bonds to the rail is propelled by its own power.

Electric Railway Improvement Co.
6005 Carnegie Ave., Cleveland, O.



Times Have Changed

"JOE," said the General Manager to the Superintendent, "do you remember the times around here a few years ago when we used to worry our heads off about handling the crowds? What a difference since we adopted Westinghouse HL Control and Multiple Unit Operation. It's a real pleasure now to watch the large crowds on two- and three-car trains coming in and going out on schedule time, without any special or risky extra train dispatching."

"In going around the country looking up power apparatus," answered Joe, "it made me feel good to see the great number of roads that have followed our example and equipped their cars with HL Control, and have also realized that the only way to properly handle daily rush hour and holiday crowds is with Multiple Unit Operation of two or three-car trains. That method of operation is real railroading."

Instructions for Use of Index

This index is essentially a subject index, not an index of titles, and articles treating a number of different subjects are indexed under each subject. In addition, a geographical reference is published wherever the article relates to any particular railway company. The geographical method of grouping serves to locate in the index any article descriptive of practices, conditions, events, etc., when the searcher knows the name of the electric railway to which the article refers. Groupings are made under the names of the city in which the main office of the company is located, and cross references are given for the names of the railways, which appear in alphabetical order. An exception is made in the case of electrified sections of steam railroads, such entries being made direct under the name of the railroad.

In the subject index, the alphabetical method is followed, and if there is a choice of two or three keywords the one most generally used has been selected, cross references being supplied. Below will be found a list of the more common keywords used in the index. This list has been subdivided for convenience into sixteen general subjects, but the general subject headings, shown in capital letters, do not appear in the body of the index. As an example, if a reader wished to locate an article on power-driven motor trucks he would obviously look in the list under the general subject "vehicles," and of the four keywords that appear under this only "Commercial Vehicles" could apply to the article in question. The reader would therefore refer to this keyword under "C" in the body of the index.

CLASSIFIED LIST OF KEYWORDS

ACCIDENTS AND LEGAL

Accidents (including wrecks)
Accident claim department
Legislation
Legal
Public service commissions
Public service corporations

CARS

Car design
Cars (descriptive)
Cleaning of cars
Gasoline cars
Lubrication
Heating of cars
Lighting of cars
Storage battery cars
Tower cars
Ventilation of cars
Work cars
Wrecking cars

CAR EQUIPMENT

Axles
Bearings
Brakes, air
Controllers and wiring
Couplers
Current-collection
Fenders and wheel guards
Gears
Headlights
Journals
Motors
Trucks, car
Wheels

EMPLOYEES

Employees
Strikes

FARES

Fare collection (including apparatus)
Fares
Freight rates
Through routes and joint rates
Tickets
Transfers

FINANCIAL AND STATISTICS

Accounting
Appraisal of railway property
Financial
Franchises
Maps
Operating records and costs
Statistics
Traffic investigations, cities

HEAVY ELECTRIC TRACTION

Heavy electric traction
High tension d.c. railways
Interurban railways
Locomotives
Single-phase railways

MAINTENANCE OF EQUIPMENT

Cleaning of cars
Inspection of cars
Maintenance records and costs
Paints and painting
Repair shop equipment
Repair shop practice
Repair shops
Tests of equipment
Washing of cars
Welding, special methods

OPERATION

Dispatching trains
Multiple-unit trains
Operating records and costs
Passenger handling records
Rules
Schedules and time tables
Signals
Stopping of cars
Telephones
Trailer operation
Yards

POWER

Boilers and equipment
Cables
Catenary construction
Converters
Overhead construction
Poles
Power distribution
Power generation
Power stations
Purchased power
Storage batteries
Substations
Transmission lines
Trolley wire
Turbo-generators and equipment

RECORDS

Maintenance records and costs
Operating records and costs
Passenger handling records
Record forms

STRUCTURES

Bridges
Carhouses
Freight stations
Power stations
Repair shops
Terminal stations and terminals
Waiting stations

TRACK

Pavement
Rail joints and bonds
Rails
Ties
Track construction
Track maintenance

TRAFFIC

Advertising
Freight and express
Parks and pleasure resorts
Public, relations with
Publicity
Routing of cars
Signs on cars
Traffic investigations, cities

VEHICLES (not on tracks)

Commercial vehicles
Motor buses
Service and tower wagons
Trackless trolleys

MISCELLANEOUS

Fire protection and insurance
Lightning
Municipal ownership
Organization charts
Public, relations with
Standardization
Storerooms
Timber preservation

In addition to the groups of articles covered by these headings the papers and reports from railway associations and technical societies are grouped under the names of the various organizations. Proceedings of other associations are indexed only in accordance with the subject discussed. The heading "Cars" includes all extended descriptions of individual types of cars, but short accounts of cars displaying no important innovations appear only under the name of the railway to which they apply. Under the headings "Financial" and "Statistics" appear all articles relating generally to capitalization, earnings and operating costs, as distinguished from the detailed and highly subdivided figures that are entered under "Operating Records and Costs." Short descriptions of machine tools appear only under the heading "Repair Shop Equipment" and are not indexed alphabetically, because of the wide choice in most cases of the proper key word.

——Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Co., 147
——New York City, 277, 460, 986, 1319
——Trespassers in Cook County, Ill., 1390
——Virginia Railway & Power Co., 185
——Westport, Conn., 235
Accountants' Association:
——Committees:
Accounting definitions, Report, 842
Claims accounting, Meeting, 213; Report, 868; Discussion, 859
Education, Report, 842
Engineering accounting, Meetings, 80; 167; Report, 895; Discussion, 891
Express and freight accounting, Report, 840; Discussion, 832
Names of chairmen, 1349
Overhead charges, Report, 865; Discussion, 859, 891
Standard classification of accounts, Report, 840; Discussion, 832
——Convention:
Constructive work accomplished, 905
President Glover's address, 834
Sessions, 832, 859, 888, 891
——Educational course in accounting:
Advance registration, 440
Details of course [Young], c31; 167
——President C. S. Mitchell, Biography, *927
Accounting:
——Bond discount, Treatment of [Fogarty], 871
——Claims accounting, Report of Claims and Accountants' Associations, 868, 891; Discussion, 859
——Cost accounting, Report of accounting association, 892
——Cost accounting in a manufacturing plant [Piper], 1337
——Course of instruction by Accountants' Association:
Advance registration, 440
Details of course [Young], c31; 167
——Course of instruction, Correspondence, New York University, 927
——Definitions, Report of Accountants' Association, 842
——Depreciation:
Analysis of different kinds which may occur in physical property. Methods evolved for computing depreciation. Comparison of their merits and demerits [Fitting], 558; Comment, 549
Compulsory depreciation in Massachusetts, 229
Depreciation, repairs and valuations [Erickson, Humphreys], 909
Equipment depreciation, Discussion at Accountants' Association, 1335
Manchester Street Ry., Fare case, 1204
Methods of calculating [Britton], c1059; [Fitting], c1164
Treatment of [Sealy], 894; Discussion, 888
——Discussions at Central Electric Railway Accountants' Association, 1334
——Engineering accounting, Report, 895; Discussion, 891
——Fair interest on investment in public utilities [Davies], 1287
——Freight and express, Report of Accountants' Association, 840; Discussion, 832
——Freight and passenger operating expenses ordered separated by Interstate Commerce Commission, 201
——Interstate Commerce Commission system, Order prescribing adoption of accounts, 14

Accounting: (Continued)
——Kansas City, Mo., Text of franchise, 114
——Replacements and improvements. Estimating the cost [George], 68
——Report of Railway Commissioners on statistics and accounts of electric railways, 1142
——Standard classification, Report of Accountants' Association, 840; Discussion, 832
——Standardization of accounts [Jackson], 1298
——Terms [Glover], c33
Accounting department:
——Calculating machines and dictaphones, Portland, Ore. [Huggins], 579
——Relations to other departments [Whitney], 774
——Work of public service accountants [Swift], 1298
Advertising. Park development, Beaver Valley Traction Co., *389

Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLIV NEW YORK, SATURDAY, JULY 4, 1914 No. 1

MR. WESTON AND POLITICS The forcible removal of George Weston as a member of the Board of Supervising Engineers, Chicago Traction, is, of course, due wholly to politics. The Board of Supervising Engineers is peculiarly a creation of the city of Chicago. It was formed under the ordinances of 1907 to give the city a regulative hand in the rehabilitation of the surface railway properties and over subsequent capital expenditures. The city wanted the board to do exactly what was done and had its way. That, so far as the board had authority, it has failed to do its work well in these respects is not, we believe, seriously claimed by anyone. The city undoubtedly made a mistake from its standpoint when it failed to write into the ordinances authority for the board to regulate service and other features of the operations and affairs of the companies. However, the fact that it did not do so when it had an opportunity cannot be laid to the door of the members of the board nor to Mr. Weston. The cause for the removal of Mr. Weston is to be found in that kind of politics which threatens disaster to all forms of regulation and supervision in this country. Such a happening naturally provokes a query concerning public ownership. If politics can determine so absolutely the disposition of a satisfactory member of a regulative body, would any less drastic step be taken where a property was not simply regulated by the public but actually operated by the public? The event is an illustration of the extreme difficulty of combining politics and the direction of public utilities. Fortunately, Mr. Weston is still chief engineer of the board.

EFFICIENCY OF CO-OPERATION In a paper which was read at this week's convention of the New York Electric Railway Association and is published in abstract elsewhere, W. H. Sawyer has emphasized the practical, common-sense side of efficiency. This treatment of the subject is timely. So much has been heard of late about the wondrous possibilities of "efficiency engineering," and so little has actually been accomplished in the way of final results, that even the sound of the name has, to many employers, acquired in mild degree the qualities of an emetic. In calling attention to the fact that efficiency may be reached through co-operation Mr. Sawyer makes an exceptionally important point. Through reasonable co-operation the operators in any industry may obtain the benefit of the costly experience that only the strongest companies can afford to purchase at first hand, yet but few of the smaller concerns take advantage of it. Each year the committees of the various technical associations present reports fairly teeming with valuable information on actual practical problems, but it is safe to say that they are not read understandingly from cover to cover by more than 10 per cent of the individual members. Certainly many of the suggestions contained in such reports are seldom put into practice, and whether this condition arises through lack of appreciation of the efficiency of co-operation or whether it is due to simple inertia the fact is obvious that so long as it continues the field of endeavor of even the most impractical reformers will be a wide one.

PRACTICE OF PUBLIC RELATIONS "I propose hereafter to stand up and be counted and let the people of any community in which I am interested know just what they are doing not only to me but to themselves." These were the words recently spoken by Thomas N. McCarter in an open meeting before the citizens of Toledo, and we wish that there were more men in the electric railway field who would feel such a steadfast resolution. There is something stirring in the thought that the president of one of the largest public utility corporations in the country can lay aside his own pressing affairs and journey westward to point with the finger of experience and wisdom to the dangers in the present Toledo situation. We do not know that the facts presented by Mr. McCarter are entirely new to the citizens of Toledo. Probably the same information has been reiterated again and again in the recent publicity campaign, but this very repetition by local officials has rendered it less forcible than the words of the visiting authority. Mr. McCarter's review of the three points of fare, franchise and municipal ownership is clear-cut and persuasive, but it carries more weight because it is placed side by side with the recital of the Toledo dispute and because it gives a running story of the more sane treatment accorded his own company in New Jersey. Mr. McCarter is optimistic and says that he believes the day is coming when electric railway properties will be recognized on a higher plane than they have been in the immediate past. It is quite certain that this optimism would not be unwarranted if all electric railway officials would personally put into practice all that has been said on the subject of public relations with as much zeal and as great a spirit of personal sacrifice as Mr. McCarter has done.

THE ALL-AROUND SIDE-ENTRANCE TYPE OF CAR A feature in the growing popularity of the side-entrance type steel girder car is its equal availability for the opposing conditions of city and interurban service. In city operation it is often necessary to have the greatest possible capacity for a given length, and this feature the side-entrance car gives in the elimination of wasteful platforms and in the greater car length which is made possible by the use of rounded ends. The low step and the desirable isolation of the motorman also commend themselves as valuable features. For interurban operation the factors of greatest capacity, maximum possible length and low step are not of commanding importance, although the tapering ends may be considered as of some benefit in reducing energy consumption. The big problem in the case of the interurban car is the location of the smoking compartment, for it is most objectionable to women and children to pass through this compartment even when it is unoccupied. The side-door car offers a happy solution, whether single or double-end operation is in vogue, because the smoking section can be provided with a separate passageway and partition doors. This consideration may seem a small one to some operators, but it was the prime reason for adopting a side-entrance car on an interurban railway which feels sure that this change will cause a large increase in mid-day traffic because "A ride will then become a part of the day's entertainment," as the manager expressed himself in regard to the change.

DOUBLE-PINION DRIVES FOR RAILWAY MOTORS

Elsewhere in this issue is an article by A. A. Blackburn, chief engineer Belfast (Ireland) City Tramways, outlining the experience of that street railway with the double-pinion drive, in which a pinion is pressed on to each of the extended ends of the armature shaft to mesh with two gears that are mounted on the axle just inside of either wheel. The direct mechanical advantages of such an arrangement are so obvious that they have often attracted consideration to the scheme, although no practical use of it seems ever to have been made in this country for street railway service. That it should first appear in extensive use in Ireland, whence came the once-famous Irish "bulls," does not by any means require that it should not be taken seriously, even though a well-known Irish engineer has said, regarding the use of two pinions, that he would rather have one boil than two boils under any circumstances which occur to him.

Indeed, it should be noted that, in addition to its obvious "squaring" effect, the scheme provides a means for eliminating several of the worst difficulties encountered with the present standard single-pinion drive. First of these in importance is the fact that the slightest wear on armature shaft or axle bearings allows the pinion and gear to separate slightly, throwing the armature shaft out of line with the axle and placing the entire strain of driving upon the inside corners of the pinion teeth. This, as is well known, results in the almost invariable breakage of teeth at the corners nearest to the motor, and, notwithstanding the extraordinarily high grades of material used for gear teeth and the conservative standard diametral pitch of three teeth per inch, difficulty is often experienced in reducing the number of pinion teeth below fifteen, although the theoretical lower limit is twelve.

As the gear diameter is naturally limited by the diameter of the car wheel, the paradoxical condition has been reached wherein the smaller sizes of railway motors actually have a slower armature speed than the larger ones. Obviously a high armature speed will reduce the weight of a motor of given horse-power in almost inverse proportion, and to a marked extent it will reduce the cost as well, so that any arrangement whereby the pinion can be reduced in size and the armature speed increased seems to be well worth a thorough tryout.

The plan of using double pinions does just this. By maintaining the teeth in line it eliminates the improper strains on the corners of the teeth, and by dividing the work it cuts in half the power transmitted by each pinion. With its use, therefore, a great increase in gear ratio becomes possible, not only by reducing the pitch and adding teeth to the gear without increasing its diameter, but possibly also by reducing the number of teeth on the pinion, and, as a consequence, the armatures of motors for city service could be speeded up materially. The equivalent of the present 30-hp motor, for example, could easily be made to give an output of 45 hp. Certainly the consequent reduction of weight and first cost would at least go a long way toward offsetting the disadvantages of the necessary extra parts, and in view of the fact that the double-pinion drive has had its practicability demonstrated not only by the Belfast installation but also by a number of American electric locomotives so equipped it looks like a means for economy that is too important to be passed by without trial.

The questions of adjustment of teeth and of providing sufficient clearance between the wheels have no doubt contributed to the general timidity with which the use of the double-pinion drive has been regarded. However, the first of these seems to have been satisfactorily met by the experience in Belfast and the second may be answered by the fact that, even when new, two pinions with 2½-in. faces would provide the equivalent of a single one with the present standard 5-in. face. When wear has taken place in the bearings and the load on the single pinion has been concentrated on the inner corners of the teeth, the two narrow pinions would provide a vastly greater effective face.

Of course, the arguments that apply in favor of the double-pinion drive in city service do not have equal weight in the case of interurban cars, which have a high free-running speed and a gear ratio well inside of the maximum set by space limitation. However, the squaring effect of the double pinions still remains and reduction in pinion trouble is inevitable, even with this class of service.

A BROAD VIEW OF COMMISSION RESPONSIBILITIES

In the early days of commission rule there was a general sentiment on the part of public utility companies that the powers conferred upon state regulating commissions would be used primarily for the imposition on the companies of greater burdens than they had hitherto been required to carry. Nor was this opinion confined in its entirety to the companies. In fact, we suspect that one of the principal reasons why many citizens advocated commission regulation was that they believed it would have the effect of reducing fares and increasing the service of the public utilities.

With the extension of the plan of commission government and its more nearly perfected operation, however, a better conception of the functions and opportunities of public service commissions has been developed. In many respects a commission is a judicial tribunal. It considers evidence and renders decisions upon its best analysis of the facts presented. But a board of commissioners has other and broader duties than those simply of a judicial character. It has executive powers, as well as judicial functions, and for this reason possesses a wider latitude in its decisions than a court, because the attitude of the latter must be one of strict interpretation of existing statutes and of the constitution, whereas by the statutes the commission is able to interpret its powers in the way it deems best for the community.

An example of this enlightened view of the purposes of a commission is shown in the decision of the Public Service Commission for the Second District of New York in a recent case of the County Council of the city of Schenectady against the Schenectady Railway. The aspect to which we refer is exhibited not so much in the conclusion announced by the commission as in the reasoning by which it reached this decision as expressed in the opinion of Commissioner Emmet.

The case came before the commission because the Schenectady Railway some time ago discontinued its practice of selling six tickets for 25 cents and established a standard 5-cent rate of fare. The usual steps were then followed of a complaint by the authorities of Schenectady and a valuation of the property to determine whether the company was earning a reasonable return at its old rate of fare. The valuation of the railway property as claimed by the company was $4,562,032 and the value as determined by the city was $3,157,809. The net profits after the annual deductions for betterments, additions, etc., amounted to about 3 per cent on the investment as determined by the company's valuation. Without these deductions, it amounted to between 8 and 9 per cent on the valuation made by the city, or with these deductions, a return considerably lower.

With these facts before it the commission justifies the higher rate and it does so not because it would not be possible for the company to keep out of a receivership at the lower rate but on the broad ground of public policy. "Our present public service commissions law was intended," the commission says, "not merely to permit corporations of this character to accumulate such scant earnings as would keep them out of the bankruptcy courts, but actually to allow them under good management to attain positions of reasonably assured prosperity. The fact, therefore, that the Schenectady Railway seems to have attained that kind of a position does not alter our opinion that such a decision as is asked for by the complainants here would be regarded throughout the State of New York, and perhaps over a larger area, as the equivalent of a warning to private enterprise and capital that these are not particularly wanted any longer in the street railway field. We do not think it well to issue such a warning, or what might with some degree of justice be construed as such, at the present time. The result of driving private capital from the work of extending and improving the transit facilities our people now enjoy would, in our opinion, be quite as deplorable from the standpoint of the general public as from that of the financially courageous individuals whose money is now invested in good faith in public service enterprises throughout the United States."

These words are refreshing. There was no need for the company to cite as a defense that a lower fare would result in the confiscation of its properties. Under the federal constitution the company is protected against the actual taking away of its property, but public policy demands more than this. As Commissioner Emmett says later in his decision: "The truth is, it is not a particularly happy time, in our judgment, for government to intervene with a heavy hand in cases like this, where the rate that is complained of is after all merely the well-known and widely prevalent charge of 5 cents for each passenger. If industrial conditions in Schenectady and elsewhere were different, if the business outlook were rosier and the difficulties in the way of an orderly adjustment of our commercial problems less complex, we might (although of this we are by no means sure) be willing to apply in this particular case a somewhat more rigorous test as to the justice of the rates involved than we are now applying. But the conditions to which we refer seem to justify us in construing an admittedly doubtful point with some degree of liberality toward the respondents in this case, leaving the way open at some future time, after a change in conditions has occurred, to consider afresh the fundamental question involved in this controversy, if by that time voluntary action has not been taken by the railway company to adjust its differences with the citizens of Schenectady on some basis that will be satisfactory to both parties."

We have had occasion in the past to comment favorably upon the decisions of the Public Service Commission of New York, Second District. Although with a changed personnel, the commission is maintaining its reputation for forceful and sound thinking for the benefit of the community, while holding level the scales of justice.

THE PSYCHOLOGY OF BUSINESS

A great deal has been said in high political circles recently about the trouble with business at present being largely psychological. Psychology has been defined as the study of the condition and phenomena of the mind, and if business and public utility companies are suffering from psychological conditions it is because the men interested in those activities have become discouraged in their outlook for relief from the conditions under which they have been and are suffering. Instead, they see evidences everywhere of a tendency in legislation to put in force untried theories of government and to disregard the experience of the past in political matters, as well as the fundamental laws of finance and business. The result is a general feeling of uncertainty and dread, which is not confined to those who are so bound to old forms and methods that they cannot see anything good in anything new but is shared by a very large part of the business world. As an example of the loose political thinking and the disregard of the warnings of the past which seem to characterize some of the political policies at the present time, we need only cite the movement in some parts of the country in favor of municipal ownership of public utilities, and even the venture of some cities in enterprises of this kind.

In a recent talk, in which he discussed this situation, F. A. Vanderlip, president of the National City Bank of New York, referred to this restlessness and desire to try all kinds of freak experiments in governmental matters and said that they result in as startling productions, viewed in the light of anything known before, as had been reached in art by the schools of cubism and futurism. He also said that he had evidence to indicate that the majority of the people of the country were not behind Congress in demanding the enactment of the further business legislation now proposed, and even that a majority of Congress itself is unfavorable to the passage of many of the present measures which have aroused the opposition of business men. His recommendation was a Congressional recess of three months to give the country a rest and to permit the members of Congress to familiarize themselves with the views of their constituents and the state of public opinion. He also recommended greater interest on the part of the business men of the country in political matters and insisted that it was their duty to assist the public to obtain clearer ideas of correct business principles.

This latter suggestion is one which ought to be followed both during a Congressional recess and at other times in the public utility field as well as in that of general business. Electric railway managers ought to know the facts about their own industry and should be equally ready to give expression to them. We are firmly convinced of the possibility of better public relations as a result of better knowledge of railway problems by the public and through this means of a better treatment of the capital invested in public utility enterprises, but we are also equally convinced that such a result will not be brought about unless electric railway officials and others whose interests are concerned with these companies assume the major part of the burden of education. Both as individuals and collectively they should improve every opportunity to give the facts and to correct every misrepresentation so effectively and speedily that the truth will surely overtake the lie. This policy, if followed consistently, will win.

FUNDAMENTALS OF "SAFETY FIRST"

The excellent and successful efforts to reduce street accidents under the "safety first" propaganda, made largely at the instigation of electric railway managements, depend for their effectiveness upon the recognition and application of certain fundamental principles. The most vital of these is that ultimately the safety of the individual depends upon the degree to which he concentrates his attention upon his own safety. When a foot passenger is on his way through the streets, his primary business is that of transportation. His duty is to get somewhere in reasonable time and with minimum danger to life and limb. His mind should be intent on this purpose only. Hence those methods of educational work which are designed to impress upon young and old the importance of mental concentration in dangerous locations are striking at the root of the matter. Detailed suggestions, which drive home the lessons of previous accidents, will serve to make the teaching permanent. Heedlessness, absentmindedness, lack of concentration, these are the causes of most accidents. We believe that only a comparatively few result from bewilderment in the face of danger, or, in other words, that the number which could not have been prevented by care on the part of pedestrian or passenger is very small.

An electric railway company naturally has every incentive to keep down the number of street accidents, and it is eminently proper that its officers should be active in any safety propaganda which is begun in the city in which it is located. But, after all, "safety first" has a far broader significance than merely that of reducing the accident account of the local electric railway company. The community as a whole has a far greater interest at stake and should, in proportion, show a far greater concern in the plan. An important matter of this kind should not be left to depend upon the enterprise and humanity of a single interest only. "Safety first" should be taught continuously, and it is a fit subject for instruction in the home, the school, the church. Herbert Spencer gives as the first aim of education training for self-support. A still more fundamental purpose in the busy community of the present day is that of self-preservation as exemplified in the care and ability of the individual to avoid unnecessary danger. When this duty is realized the question will no longer be asked as to who will continue the "safety first" campaigns which have been inaugurated so successfully and largely through the efforts of electric railway companies in different cities during the past two years. They will be conducted by the public as a part of its most essential work.

WORKMEN'S COMPENSATION LEGISLATION

The addresses that were delivered this week at Bluff Point before the New York Electric Railway Association on the subject of employees' accident insurance, while dealing more particularly with the New York State workmen's compensation law, which went into effect on July 1, should be of interest to all electric railways wherever situated, for they lay stress upon the tendency for the betterment of working and social conditions that have not yet reached their fruition among our American states. During the last few years industrial insurance and workmen's compensation laws creating new and fundamental principles of compensating workmen for injuries received in the course of their daily employment have been enacted by the United States and by twenty-two individual states.

When the American colonies separated from Great Britain, they inherited the common law under which the master was liable to his servant for damages in case of accident only when the accident was caused by the fault of the master or by a vice-principal, or agent acting for the master. Under the common law the master was entitled to three defenses: The fellow-servant doctrine, assumption of risk and contributory negligence. Such a plan was well adapted to a state of society in which the establishments of employers were comparatively small and where both the employer and employee could oversee and to a considerable extent could control the conditions of work. In other words, it was suited for a social system under which, as a rule, each employee could know his employer and most of his fellow employees, because, then, if he did not like either, he could change his job. But these defenses, especially that of the fellow servant, lost their significance when large industrial plants came into being, because then a workman might have many thousands of fellow servants whose actions he could not control and of whose existence he was in most part ignorant.

Estimates of the cost to the employer of the workingmen's compensation plan vary enormously, and it has been put as less than the present plan and also as much more. Two estimated figures quoted at the Bluff Point meeting were one half of 1 per cent of the gross receipts in the case of a manufacturer and 20 per cent of the net receipts in the case of a steam railroad. Mr. Sims, who mentioned the latter figure, also called attention to the fact that if the expense was greater than that under the present system the railroad companies could not pass this charge on to be paid by the consumer, the plan usually suggested with laws of this kind. Definite figures of the expense will not be forthcoming, of course, until the present law has been in general use for a considerable time. We believe that most railways will admit the desirability of the principle of workmen's compensation laws and will agree that their advantages are not confined entirely to the workman. Such laws are certainly in line with the spirit of the times, but if they cast an additional financial burden on the railways some means must be devised to allow these companies to shift this burden upon the riding public. Moreover, if the incidence of the compensation expenses as between the several classes of employers proves unfair to the common carriers, adjustments will have to be made to bring about a distribution which is more equitable to the carriers.

THE USES OF A TECHNICAL JOURNAL

The careful reader of a technical magazine is usually conscious of two mental experiences. He will usually notice, first, that he is acquiring information of direct use to him in his vocation and, second, that his mind has been opened to larger questions of economics and public policy, to events and experiences which affect him only indirectly. For example, here is a man who inspects car equipments for a livelihood. He is really two beings in one. As an inspector he is interested in wiring, motors, controllers and other elements of his trade. As a man he wants to know what is going on in the world around him. If he does not have this desire for a wider experience he is only an inspector, and a poor one at that.

The attention of the average reader is naturally directed first to that part of the paper which contains matter affecting him most directly, but it does not stop there. Such topics as the clamor for the electrification of steam railroads, the experiments in municipal ownership of public utilities and the tendency to more and more elaborate regulation of public utilities are of interest to the man in the pit as well as to those who occupy directors' chairs. They may not intimately concern his daily life, but neither does the war in Mexico, yet he undoubtedly follows the accounts of that in his daily paper so that he will keep informed of current events and be able to talk intelligently about them with those with whom he comes in contact. The old saying that "reading maketh a full man" was formulated long before the days of technical journalism, but it is vitally true in the industrial world of to-day. The keen, up-to-date, rising man is almost invariably a discriminating reader, broad in his selection of topics. For this reason each number of a modern journal is planned so that, as far as possible, all sections will have some value to every reader.

The editor of the technical paper wants to print facts which will help each of his readers to earn a better living and to earn it more easily. But he considers that this is far from their sole desire. He feels that while each reader is particularly interested in certain parts of the paper and in certain departments of the industry, all of his readers are broadly interested in all parts of the paper and that by keeping in touch through it with the advancement in the field they are better fitting themselves for their present work as well as for any which the future may bring to them in the form of greater responsibilities. Finally the editor also feels that it is his duty to endeavor to discern the signs of the times in the different branches of the industry, to interpret them accurately and to express them in terms of his reader's interests. These, in the main, are the functions of a technical journal.

A 151-Mile, 1200-Volt Line in Texas

This Catenary Line Gives High-Speed Service Between Dallas, Waco, Corsicana and Other Important Cities in a Rich Cotton Country—Three of the Seven Substations Have Three-Piece Motor-Generator Sets for Delivery of 600-Volt and 1200-Volt Current

Another long link in the chain of electric interurban railways radiating from Dallas, Tex., has been completed. This new line was built by the Southern Traction Company and forms a 151-mile extension to the Texas Traction Company's lines, making in all an electric railway system of approximately 250 miles. This is by far the longest electric line in Texas and it is also the longest one in the South.

Interurban railway construction in Texas began in 1900 with a 10½-mile line between Denison and Sherman. This was followed two years later by a 35-mile line between Dallas and Fort Worth, built by the Stone & Webster Management Association. The first interurban construction on a large scale, however, was started by the Texas Traction Company in 1906 when it began the laying of a 76-mile line between Dallas and Sherman.

During 1911 and 1912 the success of the first installations led to the construction of more than 230 miles of electric lines in the State, which included the Galveston-Houston Electric Railway, 50 miles long, and the Fort Worth Southern Traction Company, 32 miles long, both of which were started in 1911. In the following year the Southern Traction Company financed and commenced building its 151-mile extension, which was completed and put in operation in January, 1914.

THE ROUTE

This new 1200-volt line of the Southern Traction Company is made up of two sections, one extending from Dallas to Waco, 97.1 miles in length, and another from Dallas to Corsicana, a distance of 54 miles. Both of these divisions, along with the original line between Dallas and Sherman, Tex., traverse the heart of the great Black Land belt. This is the most densely populated and highly productive section of Texas. Within recent years Dallas has become the metropolis of the Southwest, being a railroad and business center as well as a distributing point for manufacturers' equipment and supplies for Texas and the extreme Southwest of the United States. Moreover, added impetus has been given to business prosperity in Texas by the approaching completion of the Panama Canal. With this in sight, many railroads have improved their terminals and bettered their roadbeds in order to facilitate the movement of freight to the Galveston seaboard.

A natural channel of travel exists between Dallas, Waxahachie, Hillsboro and Waco, as well as between Dallas and Corsicana, each being the county seat of a rich cotton-producing territory. In fact, Waxahachie is said to be the largest inland cotton market in the world. Taking advantage of this condition, as well as the infrequent service furnished by steam roads between the points named, the Southern Traction Company was financed locally and undertook the construction of the new electric lines.

Another feature which helps to make electric interurban railway construction and operation profitable in Texas is the fact that the legal fare is 3 cents per mile. In addition, interurban lines do not carry bulk freight, but engage in an extensive first and second-class express business with rates fixed a little less than those charged by old-line express companies. Earnings which would be considered phenomenal in other parts of the United States are obtained by Texas electric railways. Few of them earn less than 40 cents per car-mile, with an hourly passenger service and at least two or three express trains each way daily.

Summer in Texas lasts approximately ten months of the year, during which period people travel by the electric line almost exclusively in order to be free from the dirt and dust incident to steam railroad travel. This tendency has been clearly demonstrated on the line between Dallas and Fort Worth, where a steam railroad between the same points proceeded to give very frequent service at rates far below the least the electric lines could afford to charge. Despite this the travel between these two cities went the electric way almost exclusively, and in time the steam railroad had to abandon its local competitive service.

CONSTRUCTION FEATURES

Topographical conditions in the territory traversed were not ideal for the construction of a first-class interurban railway at least cost for grading, while the undulating black earth and clay hills made the grading quantities per mile quite heavy. However, these cuts and fills through the gently rolling, highly productive

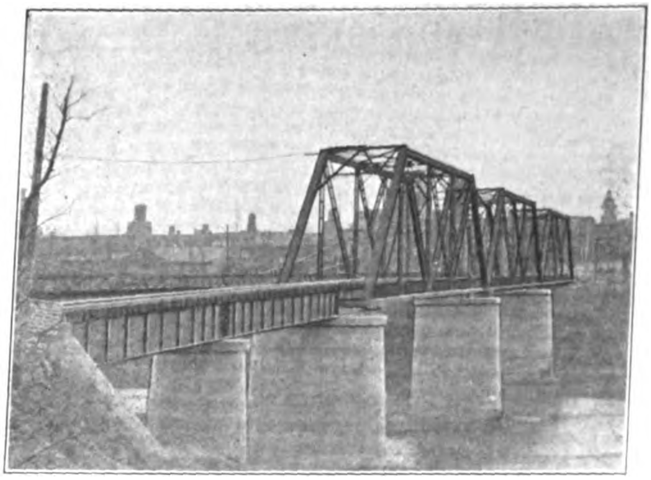
SOUTHERN TRACTION—CEDAR CREEK BALLAST DECK VIADUCT NEAR DALLAS

agricultural country made the new interurban line an interesting and picturesque one to the traveler. On the other hand, profiting by experience in electric railway construction since 1900, the Southern Traction Company provided a high-speed roadbed with a maximum grade of 2 per cent outside of the city streets and a maximum curvature of 6 deg. except where governed by streets. Of the total mileage built 91½ per cent is tangent track.

A private right-of-way varying in width from 80 ft. to 100 ft., depending upon the amount necessary to complete the grading economically, was purchased outside the cities. Additional widths were acquired at points where station sites were desired, or to provide sidings. This right-of-way is inclosed with a five-wire Osage-orange post fence with wing fences and cattle guards at all highway crossings. The standard roadway section is 16-ft. wide on embankments and 24 ft. in cuts, with a liberal allowance for shrinkage so that the seasoned embankment will remain full width. On embankments the slope is 1½ to 1, and in excavation it varies from ¼ to 1 to 1 to 1, depending upon soil conditions. The highest fill is at a point near Dallas over a 15-ft. concrete arch culvert, where the top embankment is 65 ft. above the floor of the culvert.

As mentioned heretofore, this extension comprises 151 miles of main line track, 20 miles of which, namely, between Dallas and Waxahachie, was acquired from the Stone & Webster Management Association. In addition, the completed line includes about 2 miles of second track and approximately 5 miles of sidings. The standard type of construction of all these tracks includes 6-in. x 8-in. x 8-ft. seasoned white oak ties, spaced seventeen ties to a 33-ft. rail. The ties were laid on 6 in. of gravel ballast except in paved streets, where 6 in. of concrete was placed under the ties. All gravel was taken from the railway's pits at Waco and Hutchins. Approximately 80 miles of the main-line track was built with 80-lb. A. S. C. E. rail and the remainder, except 5 miles in city streets, was built of 70-lb. A. S. C. E. rail. All turnouts from the main track are No. 9, with a 77.5-ft. lead laid on white oak switch ties cut to length, and equipped with medium height Buda switch stands. Practically all sidings were constructed with stub-ends; when the subgrade has thoroughly seasoned they will be double-ended.

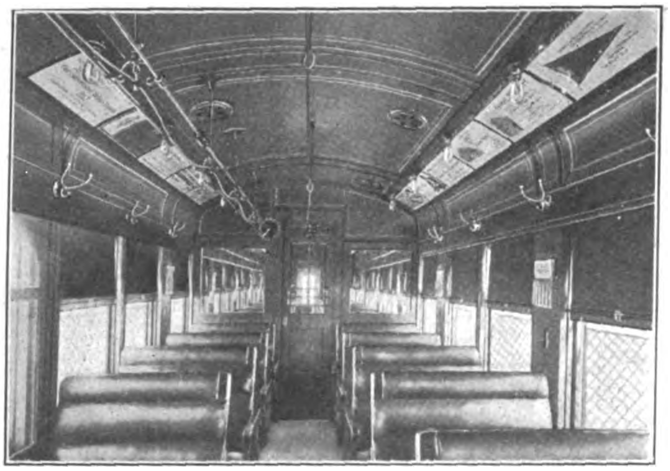


SOUTHERN TRACTION—BRAZOS RIVER BRIDGE

BRIDGES AND STRUCTURES

In all, the construction of this new line comprises eighteen steel bridges or steel viaducts having a total length of 3513 ft. The longest single span was placed over the Brazos River at Waco, being 450 ft. in length and forming three 150-ft. spans. The longest viaduct, 1454 ft., was built at a grade separation which carries the interurban line over the main line and side tracks of two steam railroads at Waxahachie. All steel bridges and viaducts were designed to carry Cooper's E-30 loading. Probably the most interesting piece of bridge construction was encountered in building the

SOUTHERN TRACTION—VIADUCT AT WAXAHACHIE



SOUTHERN TRACTION—INTERIOR OF PASSENGER MOTOR CAR

piers for the Brazos River bridge. At this point caissons were necessary to carry on the pier excavation. These were constructed of reinforced concrete with 12-in. walls, beveled at the bottom to form a cutting edge so that they would settle readily as the excavation progressed. The complete reinforced-concrete caissons were about 16 ft. in height, extending from bedrock to the bed of the river. In order to conduct the excavating to advantage, however, the caissons were built in several sections. When bedrock was reached the bottom was sealed, after which the open caisson was used as a form for the concrete piers.

Concrete structures included two reinforced-concrete ballast-rock trestles, one 660 ft. long and another 340 ft. long. Both of these structures were required just south of Dallas, and are combination reinforced-concrete, deck-girder, ballast-deck structures, the former structure, however, supported on concrete piers and the latter structure supported on two-column bents and four-column towers alternately spaced along the length of the structure. A number of other waterways were provided with concrete arches, two of which are noteworthy, one being a 50-ft. reinforced-concrete arch and the other a 40-ft. arch. All reinforced-concrete structures were designed for Cooper's E-40 loading.

In several instances the size of the opening was questionable, and rather than run any risk of future renewals by building permanent structures, wooden-pile trestles were provided. These, it was believed, would give sufficient life to enable the engineers to study conditions accurately and replace them with permanent structures when renewals were necessary. In fact, the size of these trestle openings were severely tested during the record floods in December, 1913. All trestles withstood these floods without damage, and in each instance it was demonstrated that the large temporary openings provided were necessary. In all, 11,147 ft., or 2.1 miles, of wooden-pile trestle were constructed on this new line. Small openings, namely, those between 12 in. and 48 in. in size, were supplied by non-corrosive corrugated culverts.

At three points where steam railroads were crossed, topographical conditions were such as to make grade separation exceedingly expensive. At these points the crossings were installed at grade and were protected by derails on each side of the steam railroad. The derails are operated by an interlocking device designed so that the conductor may readily close them. The locking-bed elements, however, are so arranged that the derail cannot be closed until after the danger signals have been set on the steam line, and these signals cannot be dropped to the danger position if a train is within 2000 ft. of the crossing. This locking feature is controlled by a clock set for a thirty second release.

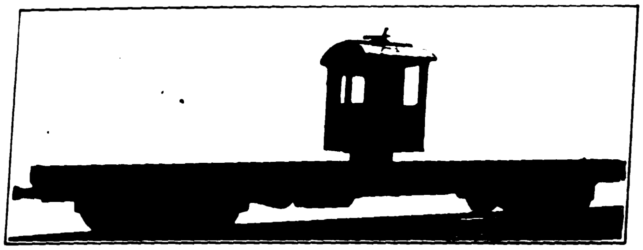
ENERGY GENERATION AND DISTRIBUTION

Energy for this new line is supplied at 2300 volts, sixty cycles by the Texas Power & Light Company, an organization controlled by the same holding company as the one which operates the interurban line. At present this energy is transmitted from the power and light company's Fort Worth station, but the larger portion of this load will ultimately be transferred to a new generating station now under construction at Waco. Energy is transmitted to six substations, including three terminal and three intermediate stations, located in the principal cities on the two divisions of the road. Each substation feeds a trolley section slightly in excess of 25 miles in length.

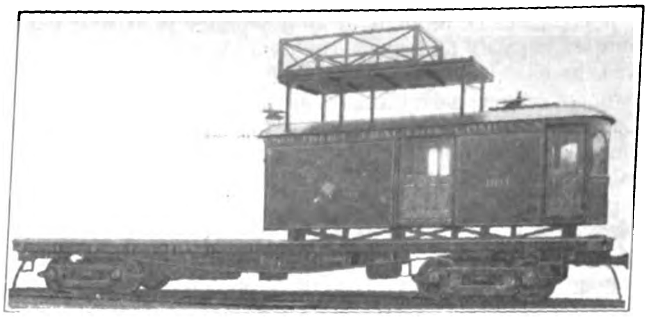
The three terminal substations are situated at Mon-

313
DALLAS
EXPRESS

SOUTHERN TRACTION—PASSENGER MOTOR CAR WITH TRAILER



SOUTHERN TRACTION—WORK CAR



SOUTHERN TRACTION—COMBINATION LINE AND WORK CAR

roe, a suburb of Dallas, Corsicana and Waco. Each is equipped with two 400-kw motor-generator three-piece sets, designed to deliver both 600 volts and 1200 volts d.c. to the trolley line, the lower voltage being necessary to comply with the ordinances of Dallas, Corsicana and Waco.

The three intermediate substations are located at Waxahachie, Hillsboro and Ennis. Each has one 400-kw motor-generator two-piece set, designed to deliver only 1200 volts d.c. In addition to the three intermediate substations, a portable substation has been purchased for use in cases of emergency.

As shown in one of the accompanying illustrations, the substations are housed in fireproof brick and concrete buildings, 40 ft. x 50 ft. in plan, with a clear inside height of 15 ft. The transmission lines enter the substation by way of a structural-steel terminal tower formed of four built-up tower posts which support the terminal insulator racks. From this point the transmission lines connect into transformers located in the space defined by the four tower posts, and lead from there to the substation by way of a small transmission bracket located on the roof, and roof insulators. The out-door substation equipment is enclosed with a high-woven wire fence as a safety measure.

OVERHEAD CONSTRUCTION

All trolley construction, except that on city streets, is of the catenary type, nine-point suspension carried on mast-arms. It is supported on 9-in. top, 35-ft. Idaho cedar poles spaced at 150-ft. intervals on tangent track, and at closer intervals on curves. The mast-arms are of the usual structural T-beam section, 9 ft. in length, provided with special end-castings at feeder taps and a long bracket steady brace at frequent intervals. Clearance between the top of rail and trolley are fixed at 19 ft. Feeder taps are supplied five to each mile, and lightning arresters at the same interval.

The high-tension transmission line is carried on steel towers along the company's right-of-way, except through the cities, where it was necessary to purchase a private right-of-way around them. This tower line follows the right-of-way from Waco to Waxahachie and from Ferris to Trinity Heights. It was built primarily to serve a number of lighting and power properties in the cities and villages in this territory. From Ferris to Corsicana the transmission line is carried on wooden poles along with the trolley wire.

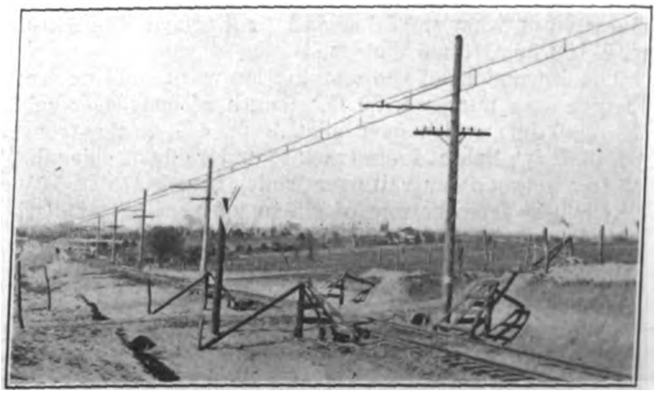
On city streets the overhead construction is changed to a simple trolley on span wires. Here also compressed, concealed rail bonds are provided in place of the brazed bond used in open-track construction. In addition to these five crossbonds are installed in each mile and special No. 0000 long bonds provided around switches and railroad crossings. Overhead construction on the bridges and viaducts, where the spans were too long and too high to permit poles to be set in the ground, was provided by setting the poles on structural-steel brackets projecting from the piers and towers. The butt of the pole was set on the bracket and it was tied in just below the bridge deck level by a structural-steel bracket designed to hold the pole rigidly in position. Several typical overhead construction installations are shown in the accompanying illustrations.

Two complete metallic telephone circuits are also carried on cross-arms set immediately below the mast-arms. These were provided for a telephone-selector system furnished by the Western Electric Company. The telephone circuits are No. 10 copper wire mounted on porcelain insulators and each telephone is protected from the high-trolley voltage by a small transformer. Both of these telephone lines are used for train dispatching; a third circuit is to be added and used as a commercial line when required.

REPAIR SHOPS AND ROLLING STOCK

General repair shops are now being constructed at Monroe, a suburb just south of Dallas, and at the junction point of the lines to Waco and Corsicana. All heavy general repair work for the new line as well as the lines of the Texas Traction Company north of Dallas will be concentrated at this point. Ordinary running repairs necessary to maintain schedules on the Dallas-Sherman line will be done at the repair shop at McKinney, where all repair work is being handled until the new general repair shops are completed.

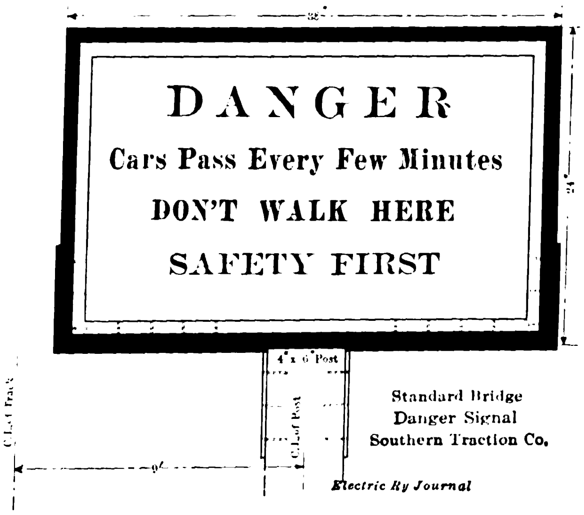
SOUTHERN TRACTION—STANDARD SUBSTATION



SOUTHERN TRACTION—OVERHEAD ON TANGENT

A complete equipment of rolling stock including passenger, express and work cars was purchased for this line, and is now in service. This list included twenty-two passenger motor cars built by the St. Louis Car Company, six express motor cars, ten passenger trail cars, two express trail cars and two motor work cars furnished by the American Car Company. All of these cars were built with underframes of composite construction, except the motor passenger cars, which are of semi-steel. The cars are finished in golden oak with tan grain leather upholstered seats. All cars were designed for high-speed. The principal general dimensions of the motor passenger cars are as follows: Over-all length, 53 ft. 6 in.; over-all width, 9 ft.; seating capacity, fifty-six passengers. The electrical equipment in these cars includes four GE-225 motors arranged for single-end control. Each car has a switch to permit full speed operation on either 600 volts or 1200 volts.

The ten passenger trail cars were also designed for high-speed interurban service, and to be coupled in trains of two or more cars each. Each side of the car is framed for seven pairs of double windows with oval-top sashes. The bulkheads at each end are fitted with single sliding doors, which, together with the end windows, are removable in hot weather. The express motor and trail cars are practically identical in construction with the passenger trail cars, except that they are designed for a carrying capacity of 40,000 lb.



SOUTHERN TRACTION—WARNING SIGNS ON BRIDGES

The combination work and line cars also have composite underframes similar to the express motor and trail cars, except for minor changes in size of the steel members. These cars were designed to carry a distributed load of 40 tons at high speed, and the principal dimensions are as follows: Work car: Length over bumpers, 50 ft.; width over sills, 8 ft. 4½ in.; width of cab, 5 ft.; length of cab, 7 ft.; wheelbase, 6 ft. 6 in.; diameter of wheels, 37 in., and Brill trucks 27-MCB-3 with 100 hp GE-225 motors.

The dimensions of the combination work and line car: Length over bumpers, 50 ft.; length of body over cab, 24 ft. 6 in.; width over sills, 8 ft. 4¼ in.; extreme width, 9 ft.; height from track to underside of side sills, 43 in.; height from rail over trolley boards, 14 ft. 10½ in.; height from bottom of sill to top roof of car, 8 ft. 6½ in.; Brill trucks 27-MCB-3 and GE-225 motors. Views of these cars are shown in the illustrations.

GENERAL

The Southern Traction Company was promoted and financed by J. F. Strickland, its president. Its opening was made an auspicious occasion with celebrations in all the important cities along the line. Much stock was sold locally, consequently there was a personal interest in the success of its operation. The road is known as the "Home Interurban." The actual construction was done by the Southern Engineering & Construction Company, of Dallas, of which Burr Martin is president and Luther Dean is vice-president and chief engineer. The operation of this new line, as well as that of the Texas Traction Company, is under the direction of R. B. Stichter, general manager.

The Canadian Radial Electric Railway Act

In a long report which he has made to the Bureau of Foreign and Domestic Commerce of the Department of Commerce of the United States on commercial and economic conditions in Ontario, Consul Julius D. Dreher at Toronto, Canada, says in referring to electric railway progress and to the extension of the radial electric railway:

"The street and rural electric railways in the Dominion have a total first main track mileage of 1357, or, including second main track mileage, a total of 1727 miles. Of the former total, Ontario lines have 543 miles, or 40 per cent, and of the latter 659 miles, or 38 per cent. Of the total capitalization of $141,235,631 the lines in Ontario have $44,591,296, or 31.6 per cent, and of the total net income for the year ended June 30, 1913, amounting to $6,612,575, Ontario lines made $2,710,375, or 41 per cent, which was a net profit of 6.1 per cent on the total capital invested in Ontario lines. Only three of these lines showed a deficit last year, the aggregate loss being $34,197. It is expected that the mileage of rural car lines will be considerably increased in the near future.

"In April last the Dominion Parliament passed an act conferring further powers on the Hydroelectric Commission in order to promote the building of radial, or interurban electric railways. Under the provisions of this act the commission will construct, equip and operate these lines for the benefit and at the expense of the municipalities. The railways will be built with money secured by issues of bonds by the Hydroelectric Commission, guaranteed by the Province. The government will in turn be protected by requiring the municipalities to deposit with the commission debentures covering the expenditure made. The interest, sinking fund, or possible deficits will be met by the municipalities interested. The bonds covering construction will be extended over a period of fifty years, a provision calculated to lighten the burden upon the enterprise, and in order to tide over the first ten years, when the roads are getting under way, the municipalities will not be required to pay sinking fund charges at all.

"As an added protection for the commission, it is provided that where a municipality defaults on its interest or sinking-fund payments the commission shall have the right to go on the market and sell the debentures of that municipality to make up the deficiency. Where the debentures fail to produce the necessary amount the municipalities can still be made liable for any amount still due the commission, as its bonds will be a first mortgage upon the railway property.

"The responsibility for entering upon a radial railway project lies entirely with the municipalities. The commission is empowered to enter into a contract with one or more municipalities, with the approval of the Lieutenant-Governor in council. The agreement or contract must then be submitted to the electors qualified to vote upon money by-laws."

For electrification of railways in Japan the sum of $1,250,000 has been included in the budget for the current year of the Japanese Imperial Railway Board.

The Question of Public Relations

Full Text of Speech Delivered at Public Meeting at Toledo June 25 by Thomas N. McCarter, President Public Service Corporation, Newark, N. J.—The Speaker Discussed the Toledo Situation, the Hazards of the Industry, Rate of Return and Other Allied Subjects

The trouble with this street railway proposition is that most people do not know anything about it. If we who are versed in this business should undertake to tell them as much about their business as they with great nonchalance tell us about ours, they would quickly inform us that we were talking about things we knew nothing of. With what I say on this subject, I have no false modesty. I speak whereof I know, taught in the school of hard experience.

A 3-CENT FARE INADEQUATE

I start with the direct proposition that it is impossible, under present-day conditions, to operate an up-to-date street railway in this country, pay operating expenses and earn interest on the actual cost of the investment on a 3-cent fare. Why this demand for a 3-cent fare? Have the gentlemen who so clamor for such a fare worked it out scientifically? If I understand the principle of rate regulation at all, it is that electric railways, being quasi-public bodies, must be allowed to earn, in exchange for the franchise grants, only a fair return upon the value of the property devoted to the public use. Who has told these gentlemen that a 3-cent fare will do that? Why is it that they clamor so loudly for a 3-cent fare? Why do they not make it 2 cents or 1 cent? It is simply a will-o'-the-wisp, a happy catch word of the politicians.

While I accede entirely to the proposition that in the long run one catches more flies with molasses than with vinegar, and I am willing to go the limit in endeavoring to placate even those whose intelligence I may not respect, I do not propose that the interests I have in hand shall be ridden over rough shod by the demagogues and the cheap politicians without a fight. I venture to say that of those in authority clamoring after this fare at the present moment, there is not a single man, in this city or elsewhere, who can tell you the basis of his belief, other than that the companies under discussion are public service corporations, that fortunes have been made out of those properties, perhaps improperly, in the past, and that, all things considered, 3 cents is enough for them. The whole 3-cent fare agitation is uneconomical and unsound, and as soon as the people of this country get that in their minds the better for everybody, including themselves.

The railway property of the Public Service Corporation of New Jersey has gross receipts of approximately $16,000,000 a year. We furnish with transportation all of the larger cities of the State of New Jersey, with the exception of Trenton, and many of the smaller ones. We operate large city, suburban and interurban properties. We have a straight 5-cent fare with a very liberal transfer privilege, so that the county rather than the city is largely our 5-cent fare limit. To that extent we are liberal. Sixty per cent of a 5-cent fare is 3 cents. In 1908 our vast system was operated for 61.7 per cent of its gross receipts. In 1909 it was operated for 59.1 per cent of its gross receipts, in 1910 for 60 per cent, in 1911 for 63 per cent, in 1912 for 63.6 per cent and in 1913 for 63 per cent. Where would we have been with a 3-cent fare? We would not have paid operating expenses, except in one year, when we would have had 0.9 per cent over.

Some one will say that the 3-cent fare will very largely increase the receipts because of the large increase in the riding habit over what it would be with a 5-cent fare. It is not so. We have just been through an experience of this character in our gas business. For many years our average increase in the output of gas has been 7 per cent. A year ago the Public Utilities Commission of New Jersey reduced the price of gas from $1 to 90 cents per 1000 ft. and they and the people of New Jersey said that we would more than make up the decrease in price through the increase in consumption. The first year, under the 90-cent gas rate, we increased a little over 6 per cent, or less than the 7 per cent average of the preceding ten years. The same result was demonstrated in the New York Consolidated Gas Company matter, where the price of gas was reduced from $1 to 80 cents with absolutely no abnormal increase in consumption.

HAZARDS OF THE INDUSTRY

We are at the parting of the ways with these industries in this country. I am not an apologist for the past. I know money was made out of public utility properties in the early days, and that some things were done which would not be countenanced now. I am not so sure that they were wrong. You must remember the electric railway industry is only twenty-six or twenty-seven years old. I still adhere to the principle that a man who has the hardihood to venture his money in a new and untried art that develops and changes over night, is entitled to make a good profit, something more than interest on his money. If he were not entitled to such a profit, he would be a fool to go into the enterprise. It is easy when success is assured to begin to talk about cutting down the rate of return to something more nearly normal, but when you are talking about the industry that in only twenty-seven years has almost revolutionized transportation in the world, it is too soon to begin to cry "Wolf" and to attack the early investors because they have made money out of it.

When this country wanted a transcontinental railroad built, it held out very great inducements to the promoters who would build it. Among other things, the government gave thousands of acres of land along the line of the Union Pacific Railroad. After the Union Pacific became a success, it undertook to take the land back. Was that fair? Did not the men who had the hardihood to go into that enterprise have the right to keep this land? They did, and the United States Supreme Court said so. It is the same thing in this matter of ours. A few years ago some gentlemen had the hardihood to build tunnels under the Hudson River, connecting the States of New York and New Jersey. Nothing has ever been done that has been as great a boon to New Jersey as the making of these tunnels, but the venture has not been a success. The property has had to be readjusted, and the bonds which were issued only for investment have had to be scaled down, half being mortgage bonds and half being income bonds. The company is now earning interest on the mortgage bonds and hopes some day to earn interest on the others. Will anyone say that those gentlemen who had the temerity to put their money in the bowels of the Hudson River and connect the great States of New York and New Jersey by rapid transit, should, if their enterprise ever does prove successful, be limited to a 6 per cent return on their investment? If this is adopted as the policy of this country it certainly means to say that no such enterprise will be established, for no man will be fool enough to undertake the risk and hazard of such an extraordinary enterprise under such conditions.

Would any of you take a franchise to-day for airship work and put your money into it? Would any of you back an enterprise that had transportation between here and Detroit by air for its object? It is not any more unlikely, thirty or forty years hence, that there will be such a means of locomotion between here and Detroit than it was thirty years ago that street railways would be what they are to-day. If you and I had the hardihood to back an enterprise of this kind and we waited until the people began to use it, would we not be entitled to more than 6 per cent on our investment?

FAIR RETURN FOR ESTABLISHED PROPERTY

After a property has become established, as ours is at present, though not firmly, a different problem presents itself. There should be no extraordinary or improper return, but the return should always be substantial and above the legal rate of interest. Otherwise I, for one, who have some idea of the annoyance and responsibility of this work, would leave my money in a savings bank or take a mortgage on real estate, and leave the troubles of this business for someone else. What is a fair return on the hazards of the business? I cannot say, but I know it must be sufficient to attract capital. It must be sufficient to keep the property developed up to the needs of the city, and, by and large, it should never be less than 8 per cent on the value of the property devoted to the public use. Otherwise capital will flow elsewhere into different channels with less hazard. Any community that seeks to pare down the return below this point hurts not only the traction company but more especially itself.

When I was president of the American Electric Railway Association, I went from one end of the country to the other making speeches. The great value of this was that I saw how the different properties were operated and how they were developing the cities of the country, and I say, without fear of contradiction, no one other single element that has arisen in the last twenty-five years has so developed the American city as have the electric railways of this country. And they will go on developing this country if they are allowed to. Just think how they have revolutionized the lives of the people of the cities. Just think how they have made it possible for men of moderate means to live in the suburbs and to own their own homes instead of living in the congested centers in tenements. All has been done with a maximum of a nickel fare, throughout the length and breadth of this land, and yet the cry goes up that we are robbing the poor people and robbing the country, when as a matter of fact we have not only done this development work but have also created untold amounts of wealth for the individual property owners, and also for the cities themselves through the medium of the increase in tax values. It is such a mistaken point of view for municipalities to try to draw the last drop of blood and insist upon the last pound of flesh. How much better it would be, instead of the turmoil that is in Toledo at the present time, to have a company allowed to go on in its own way, regulated, with rates so that the return would be commensurate with the service rendered, but so that the company could get the necessary capital to develop the city. How much better would every individual be if that were the case, instead of having the present condition prolonged to an indefinite future, with a saving once or twice a day of some portion of a cent.

RESULTS OF 5-CENT FARE IN NEW JERSEY

I said we had in New Jersey 5-cent fares. So we have, but by the operation of the transfer system it is reduced, as far as the fare per ride goes, to 3.8 or 3.75 cents. That is the fare that every passenger who boards a car, whether for a cash ride or a transfer ride, pays us. A 5-cent fare, or this 3.8-cent fare, enables us to pay our operating expenses, pay a reasonable return upon the investment of capital, and, what is more important, obtain the necessary new capital for further development. In the eleven or twelve years of my administration, there has been invested between $30,000,000 and $40,000,000 in the development of the railway property alone. Under present conditions in Toledo, how long will it be before that sum of money is invested here?

Only yesterday I had the great privilege in the city of Newark of turning the first operation of a steam shovel on a new electric railway terminal which we are about to construct for the purpose of taking our cars off the congested centers of the streets. We approach this terminal along the one side by a subway a quarter of a mile long, and on the other side by an elevated line a quarter of a mile long. On the ground floor of this building will be a great concourse, like that of the Hudson Terminal, one flight down to the subway and one flight up to the elevated. When the terminal is done, we shall be able to double the cars now in use, and we hope to increase our business very materially. It will cost more than $5,000,000. We had no trouble to get the money because of the conditions I have spoken of, but if you needed such a terminal in Toledo at this time, you would have a nice time getting any $5,000,000.

The answer to the whole proposition is that while there are peculiarities about this business, it is like every other business; it is governed by inexorable economic laws, which no amount of skullduggery or tomfoolery or political nonsense can overcome. Some people say I am blunt and tactless at times and undiplomatic. I am all through with trying to soft soap these things to a successful issue. I propose, for one, hereafter to stand up and be counted and let the people of any community in which I am interested know just what they are doing, not only to me, but to themselves.

THE FRANCHISE QUESTION

I know it is hopeless for me to attempt to change the attitude of the Middle West, or perhaps the rest of the country, on the question of short term franchises, but I also know that the principle of a short term franchise is all wrong. It is uneconomical and unsound. I do not argue for the old fashioned, unregulated, perpetual franchise, which allows properties to be exploited by a few men for the benefit of themselves. Now that regulation has come to stay, as it has in this country, these things are a thing of the past. The question of the length of the franchise, from the standpoint of the municipality, is relatively unimportant, whereas to the company itself it is of vital importance. Some say a twenty year franchise is long enough, and they ask you to make a large capital investment or to retain your present capital investment, with a twenty year franchise, and let the future take care of itself. Suppose any of you leased a piece of property on any of these main streets, where the property values are high, for ten years, and only for that period, and you went ahead and put a large mercantile building upon it, costing $100,000. Would not any reasonably prudent man, if he had only a ten or twenty year lease on that property, charge off one-tenth or one-twentieth of the value of his property as he went along? If these short term franchises are to be granted without any hope in them beyond the limit of the day to which they are granted, then I say it is the duty of the company to amortize its investment. In such a case, who must pay for the amortization? The people who ride on the car. It becomes an operating expense, or a fixed charge, an expense akin to an operating expense. In other words, it is a short-sighted policy on the part of the municipalities to insist on short term franchises unless they want to put an undue burden on the present generation. The length of a franchise period becomes immaterial when it is assumed that there is a commission that will enforce good service and reasonable rates. These constantly recurring periods, such as occurred a few years ago in Chicago and Cleveland, and such as is now going on in Toledo and is about to burst wide open in Detroit, hurt the community. If this franchise question did not come to a head with such periodic frequency, but went on either indeterminately, or so that the amortization would be spread over a long period of years and not fall so heavily upon the present generation, it would be better for all concerned.

MUNICIPAL OWNERSHIP OF RAILWAYS

I recently appeared before a committee of the House of Representatives in Washington, which had before it a proposition to condemn the street railways of the city of Washington for governmental use. The committee of the District of Columbia, before which I appeared, consisted, I think, of a total membership of twenty-one men. They were called together to hear what was to be said upon this very important question, and at one time while I was talking there were actually five of the twenty-one present. That committee has since voted nine to eight to report the bill. I have not much fear that the bill will pass, but I do say that for a Congressional committee composed of twenty-one members to give such a scant hearing and attention to this vital matter is a travesty upon our system of politics, and something will have to be done by the legislature if it is going to carry on its work in committees, to overcome this evil. Mr. Brady confirms this, because he recently appeared before a Senate committee in an equally important matter and had practically the same experience. We were representing vast amounts of capital and should have been granted a full hearing, so that the committee members might at least know upon what they were voting, which was not the case with the recent vote in favor of condemning the Washington railways.

In regard to the wisdom or foolishness of municipal ownership, my own judgment is that it is a very foolish thing for this government or for our municipalities to undertake. I am willing to admit, with some reservations like the one just spoken of in Washington, that our scheme of national government has been a great success. Our fathers built better than they knew, and we have had a hundred and thirty-five years of marvelous success. With the state governments the plan has also worked well, and in the main they have been honest and economically managed. Who can say the same thing about our municipal governments? Municipal government, as it has been worked out in the United States up to the present time, is a failure. The municipal governments in this country have not been as practical, so far as the personnel of the men, the results obtained, and the efficiency of the government concerned go, as have the national and state governments. Upon this premise, of which I defy contradiction, does it seem wise to turn over to these gentlemen, who have already made a failure of almost everything they have undertaken, the burden of the operating of public utilities?

Some utilities are easier to operate than others. The gas business, for example, is all underground and not in the public eye very much. The street railway business, however, is before you every day and many times a day. The men operating the cars are coming in constant contact with the public. Some times they lose their tempers, as much as we try to keep them from it, and, stranger still, sometimes a passenger loses his temper. Imagine what kind of operation you would have, after a short time, with these street railways in operation under the guidance of the municipal governments of this country. But, even if they were equipped to do their present work well, have they not about enough to do—parks, play grounds, sewers, schools, libraries, streets, paving, water supply, and all the rest of it? Is it not too much to turn over to these already overburdened cities the operation of all these utilities? Moreover, think of the money involved. We showed the committee in Washington that to take over the Washington railways would require not less than $50,000,000. If they would come knocking at the door of my company in New Jersey, I can promise them that the price would be not less than $300,000,000 on a careful valuation. Think of the straining of municipal credit, already overstrained in this country, if the cities attempted to buy such properties. If they began borrowing these enormous sums of money, how long would they remain on a 4 per cent basis, if they are on that basis at the present time? Before they knew it, the municipal rate would be up to 6 per cent. But the municipal ownership advocate says that even if it is 6 per cent, the company wants 8 per cent, so that the rate will be 2 per cent cheaper anyway. How long would that 2 per cent last as between efficient private operation and municipal ownership? In my judgment, it will be a sorry day for this great republic when, in addition to all the present troubles these municipalities have, they take upon themselves the operation of public utilities, paying for them sums running into the thousands of millions of dollars.

All I ask on this subject of municipal ownership is that self-respecting citizens should come and reason together, and try to decide whether, after all, the better way is not to let these companies continue to develop the communities in which they operate and make a fair return upon their money invested, thus enticing more money for further developments, rather than embarking upon the seas of municipal ownership, with its dire and dread consequences. Let those of us who are operating these properties realize our responsibilities and hold ourselves to the full measure of our duty toward the public, devoting our surplus energy to improving conditions wherever we can. I know the men who are engaged in the electric railway business in this country, and I say that nowhere is there a more honest, loyal, devoted, patriotic set of men in any business in this country. Our business did not exist at the time of the Civil War, but the railroads existed at that time, and the history of that war is replete with the patriotism and the valor of the men who were then operating the great steam roads. Many of them laid down their work and went to the war, and those who stayed operated the railroads through that crisis, first for their country and then for the owners of the properties. And so it would be the same to-day. There has grown up a feeling in this country that a man connected with a large public utility corporation is hardly fit to associate with. I resent this feeling, for myself and all those who are interested in this business, because I know that each and every electric railway man is just as solid and sober a citizen as one from any other class of men in this country.

Many of us are trying to do what we can to improve conditions among those that work. The companies have welfare funds and minimum wages for female employees, and in many other ways they are vieing with each other to better the tone of all those laboring for them. Let us devote ourselves, after we have done our duty to our communities and to our stockholders, to this ennobling work, first, because it is right; second; because it will make the world a better place to live in, and, third and selfishly, because it should help to stem this tide of thoughtlessness that seems to be so prevalent about us.

I have been discouraged at times, just as have many of you who are operating these properties, but I am not finally and eternally discouraged. I believe the dawn is coming when our properties are to be recognized on a higher plane than they have been in the immediate past, and that the good judgment of this country, perhaps differing in the non-essentials, will say that the philosophy that I have tried to give thus far, is, after all, not only for the welfare of the public, but for the country at large.

Interstate System of Accounts

The complete system of accounts prescribed by the Interstate Commerce Commission for electric railways subject to its jurisdiction has been issued. The accounts are effective on July 1, 1914.

The order of the commission prescribing the adoption of the accounts is in part as follows:

"Any such carrier or any receiver or operating trustee of any such carrier may subdivide any primary account established in the said issue (as permitted in the general instructions contained in the said issue); or may make assignment of the amount charged to any such primary account to operating divisions, to its individual lines, or to States. Provided, however, that such subprimary accounts set up or such assignments made by any such carrier or by any receiver or operating trustee of any such carrier do not impair the integrity of the accounts hereby prescribed.

"In order that the basis of comparison with previous years be not destroyed, any such carrier or any receiver or operating trustee of any such carrier may, during the twelve months from the time that the said issue becomes effective, keep and maintain, in addition to the accounts hereby prescribed, such portion or portions of its present accounts as may be deemed desirable by any such carrier, or by any receiver or operating trustee thereof, for the purpose of such comparison; or, during the same period, may maintain such groupings of the primary accounts hereby prescribed as may be desired for that purpose.

"Any such carrier or any receiver or operating trustee of any such carrier, in addition to the accounts hereby prescribed, may, unless otherwise ordered, keep any temporary or experimental accounts the purpose of which is to develop the efficiency of operation: Provided, however, that such temporary or experimental accounts shall not impair the integrity of any primary account hereby prescribed."

The introductory letter of Fred W. Sweney, chief examiner of accounts, says:

"This uniform system of accounts for electric railways supersedes the classifications of expenditures for road and equipment, operating expenses and operating revenues which became effective Jan. 1, 1909, and all conflicting instructions contained in Accounting Bulletin No. 7.

"In formulating this uniform system of accounts for electric railways, containing the first revised issues of the classifications of operating expense, operating revenue, and road and equipment accounts, and also the first issues of the classifications of income, profit and loss, and general balance-sheet accounts, it has been the purpose to enlist the co-operation of representatives of electric railways and of the various State commissions. Accounting series circular No. 41, containing a tentative system of accounts, was submitted to the representatives of all such carriers of record in this office and to each of the State commissions for criticisms and suggestions, and careful consideration has been given to all replies received.

"In the preparation of the revision of the accounting rules contained in this system of accounts for electric railways the commission has had the co-operation of the committee on a standard classification of accounts of the American Electric Railway Accountants' Association.

"Special attention is directed to the provisions for depreciation. The use of account No. 40, 'depreciation of equipment,' is mandatory. Until further notice the use of account No. 25, 'depreciation of way and structures,' and No. 50, 'depreciation of power plant buildings and equipment,' is optional with the carrier.

"In order that uniformity in the application of the provisions of these classifications may be secured, accounting officers are requested to submit all questions of doubtful interpretation to this office for consideration and decision."

The general instructions on operating expenses say regarding depreciation:

"Depreciation accounts in which to include monthly charges to cover depreciation of way and structures, equipment, power plant buildings, and power plant equipment are provided in order that carriers may create reserves which will meet or reduce the amounts otherwise chargeable to operating expenses or to profit and loss account to cover the cost of the renewal or retirement of property. Such depreciation charges should be upon a basis determined to be equitable according to the carrier's experience and best sources of information as to the actual accruals of current loss from depreciation. Depreciation charges with respect to property or equipment shall cease when the difference between the ledger value (estimated if not known)and the estimated scrap value shall have been credited to the depreciation reserve account. A statement of the bases used by the carrier for computing these charges shall be included in its annual report to the commission.

"Commencing July 1, 1914, carriers shall accrue depreciation on equipment (included in accounts Nos. 530 to 535), but the accrual of depreciation on way and structures, power plant buildings, and power plant and substation equipment is left optional with the carrier until the commission shall direct otherwise.

"When equipment (included in accounts Nos. 530 to 535) is retired from service and proper charges for depreciation have not been made during its life, the ledger value of such equipment, less salvage and depreciation accrued to the date of retirement, shall be charged as follows: That proportion of the actual loss from depreciation equitably assignable to the period prior to July 1, 1914, shall be charged to profit and loss and the remainder shall be charged to operating expense account No. 41, 'equipment retired.'"

The outing of the Jovian League of Louisville, Ky., will be held at Sennings Park on July 14, and will consist of a dinner dance on the cabaret order. A special orchestra will furnish the music.

Meeting of New York Association

The Main Topics at the Thirty-second Annual Meeting of the New York Electric Railway Association Were Employees' Accident Insurance, Accident Prevention and Efficiency in Operation

The thirty-second annual meeting of the New York Electric Railway Association was held at the Hotel Champlain, Bluff Point, N. Y., Tuesday and Wednesday, June 30 and July 1, 1914. The program was of the most timely character, the chief subject being that of employees' accident insurance in view of recent New York legislation on this matter. About 200 delegates and other visitors attended the sessions and annual banquet.

TUESDAY MORNING SESSION

The session on Tuesday morning opened with the usual routine business. President Hedley welcomed the convention in a most striking address on the big problems now before the railway operator.

PRESIDENT'S ADDRESS

Mr. Hedley said that in these days there was a greater field for the association than ever before because the electric railway business of late had gotten into a situation where it must be carried on with an absolutely new set of rules. Most operators in the past had been compelled to run their business in a way that would not be tolerated to-day. Many of the railways in the State, he could safely say, had been founded and capitalized under conditions that would not now be permitted—conditions that made it extremely hard for a manager to make a good showing. So the new rules were not altogether against the managers. Some of the new rules under which the railways were now being financed were very good for the operators. There had been a time when a manager who had come to the point of meeting the existing fixed charges was confronted by the financier's demand to meet the interest on a new issue of unloaded securities. Such things could not be done nowadays, and that was of great advantage to the manager.

Two things, however, of the greatest importance were left to the manager, and to these the association was giving ample attention. One was the safe operation of their properties—that meant a great deal. He did not believe that the best way of handling this problem was to send a laborer over the system to stencil "Safety First" on every shanty, plank and box. This was to make a jest out of a great movement and to harm instead of benefiting it. "Safety first" must start with the manager and must go down through his various subordinates to the commonest laborer. The matter of safety was one that was up to the managers more than to the public authorities.

The second thing now before the managers, and one in which the public authorities could interfere, was that of efficiency. This problem, like the price of liberty, demanded eternal vigilance. He did not see how it was possible for any legislation or legislators to do anything to take these two things—safety and efficiency—away from the railway manager.

Following President Hedley's remarks, the Hon. James J. Hoey, second deputy superintendent of insurance of the State of New York, delivered an address on "Employees' Accident Insurance," which will be found in abstract elsewhere in this issue.

DISCUSSION ON MR. HOEY'S PAPER

J. S. Kennedy, secretary benefit fund committee New York Telephone Company, spoke of the welfare work of that company and other Bell organizations. Eighteen months ago the New York Telephone Company and all other Bell companies in the United States had set aside the sum of $2,000,000 as a permanently unimpaired fund for general welfare purposes. Pensions are granted to all male and female employees after twenty, twenty-five or thirty years of service, according to certain conditions, and after only fifteen years in case of total disablement. For accidents an employee, regardless of term of service, receives full wages for the first thirteen weeks and half wages for an indefinite period thereafter during the continuance of disability. For death by accident, regardless of term of service, three times the annual salary, with a limit of $5,000, is paid. For death by accident to an employee of five years' service, his heirs received six months average wages; for a like cause, the heirs of a ten-year employee received one year's average wages. For sickness, after two years or more of service, sick benefits of the same nature as the accident benefits are paid. The Bell companies were self-insured, and permission to continue such self-insurance had been granted by the Workmen's Compensation Commission of the State of New York.

Mr. Kennedy pointed out that the compensation provisions of his company were more liberal than demanded by the State of New York. For instance, the law grants no weekly accident compensation for the first two weeks, while his company had it begin immediately. His company was now co-operating with the commission to harmonize a number of differences on this general subject. In concluding, he said that 97 to 98 per cent of the telephone company's accidents caused disability lasting for less than thirteen weeks, while 76 per cent were for less than two weeks.

Capt. W. B. Rockwell, Eastern Pennsylvania Railways, Pottsville, Pa., thought it was the height of folly to expect women to get off cars the right way from instructions merely by use of posters. Where passengers were under the control of the conductors, the latter alone must be held responsible for safety. Mechanical appliances were not the most important means for preventing accidents. Far more could be accomplished by square treatment of the men, for this in turn would lead them to reciprocate by using greater care in operation.

Mr. Hoey observed, however, that the mechanical arrangements of the New York stepless car were such as to make boarding and alighting accidents impossible.

Mr. Rockwell said that he also believed in the stepless car, but since such a car required maximum traction trucks it could not be used where grades were heavy.

President Hedley complimented Mr. Hoey on the sincerity of his paper. However, he did want to take exception to his statement that operators wanted their crews to make time regardless of safety. He knew that no good operating man would ever countenance such a practice. As to accidents, President Hedley said that his company's records showed that women took better care of themselves than men, so why direct so much attention to the ladies? Mechanical safety appliances were a necessary curb on stupidity.

The session was adjourned after a rising vote of thanks to Mr. Hoey.

TUESDAY AFTERNOON SESSION

President Hedley opened the afternoon session by introducing Martin E. Burke of the Interborough Rapid Transit and New York Railways legal department. Mr. Burke said that the companies named, as well as the Third Avenue and New York & Queens County Railways, had decided to insure themselves because it was cheaper. Further, as a part of their welfare work, these companies for years had been paying their men where no liability existed. He believed that nothing would make railways more careful than if they had to pay out large sums of money directly instead of indirectly through premiums to insurance companies. The existing organization was such that this self-insurance could be carried at say $100 extra a year in clerical expense. He believed that it was perfectly feasible for the State to quote lower insurance rates than stock companies, as the latter must pay for solicitors and give dividends to stockholders. The State fund has no such expenses, and for the first two and one-half years the cost of operation will be absorbed by the State at large. An important reason for favoring the State fund was that if a stock company failed the policyholder therein would not be absolved from liability, whereas the State fund insured this absolute release from liability. He was still more in favor of self-insurance because it would be cheaper in the end. The only difference was in the State fund's provision for medical and hospital attendance, but his companies had taken care of their men in this respect anyway. These companies were also more liberal in paying the wages of injured men from the start instead of waiting two weeks. Payment in such cases was made upon recommendation of the injured man's foreman and superintendent. The new law required medical attention to be given for eight and a half weeks. The practice on his companies' properties was as follows: "First-aid" men who had been trained by the chief surgeon were stationed at the shops and other places where groups of men were working. The chief value of the "first-aid" man was to prevent little hurts from becoming big. An improperly treated scratch or cut, for instance, might easily lead to blood poisoning. If the injury required further attention, the employee was sent to a local doctor. Following this, he could be sent to any of four hospitals, where he would be placed in semi-private quarters under the care of high-class physicians and surgeons. Even after leaving the hospital he is free to return to the care of these men instead of going to a dispensary. Arrangements are also in force for treating men at their homes.

MR. PHILLIPS ON ACCIDENT INSURANCE

The next speaker was Cyrus W. Phillips, deputy commissioner Workmen's Compensation Commission of the State of New York. Mr. Phillips prefaced his remarks by saying that it would be better for our system of legislation if business men gave their attention to laws while they were in the making rather than to criticise these laws after they had been passed. Mr. Phillips then referred to the old law of negligence. This was a fiction set up by the courts under which an employee had been prevented from getting damages if he or his fellow servants were negligent or if the injury was due to the risks of the occupation. All this had been eliminated by the compensation law, the fundamental idea of which was that an industry should bear the cost of scrapping a workman as it had borne the cost of scrapping a machine.

For many years legislation had been advocated and passed to do away with the negligence and occupational barriers set up by the courts. In the federal law the fellow-servant, assumed risk, and contributory negligence rules had been swept away, and, in addition, a safety appliances law had been passed. Thus the compensation law would put a stop to measures which would have proved more costly in the end. Some twenty-six States now had compensation laws, but the New York law differed from most of the others in being compulsory instead of elective. Where selective insurance was in vogue, support of the law seemed to meet with a heartier response. However, he had found that where the agreements between employer and employee were not controlled by the State, as in New Jersey, many of the agreements filed with the Department of Labor showed that the employers had failed to pay the proper compensation. In other States, as Massachusetts and Michigan, the agreements were subject to correction. In general, the New York law was more liberal to the worker than any other either in the United States or Europe. He appreciated the fact that while other employers could add the cost of insurance to that of their product, the electric railway with a straight 5-cent fare could not.

C. S. Sims, vice-president and general manager Delaware & Hudson Company, said that the premiums under the new law would amount to 20 per cent of one steam railroad's net earnings. He also believed that smaller manufacturers might be tempted to leave the State because of the burden imposed by the law.

Mr. Phillips replied that the steam railroad would have had to pay in any event because of the federal laws. As to manufacturers, the premium amounted to no more than 0.5 per cent of their business, and this difference was too small to cause removal to the States that had no compensation law. In conclusion, Mr. Phillips pointed out that the reason for not paying benefits during the first two weeks was to prevent beneficiaries from staying home unnecessarily.

Mr. Gonzenbach's address on "Accident Insurance" was then presented. It will be found on another page.

MR. BALDWIN ON ADVANTAGE OF INSURING IN STATE FUND

The next speaker was F. Spencer Baldwin, manager State Insurance Fund, Workmen's Compensation Commission, State of New York, who spoke on the advantages of insuring in the State fund. Compared with stock companies, the State fund offered the only real insurance obtainable if insurance meant protection, release from liability and immunity. Under Section 53 of the law, the employer is granted a full release from liability if he insures in the State fund. On the other hand, the employer must assume the liability himself if the stock company fails. As a matter of fact, such companies differed widely in stability, as was proved by the fact that thirty British insurance companies had become insolvent since 1897. The State fund gave complete protection at the lowest cost. The rates were 8 1/3 per cent below those of the stock companies and were subject to further reduction for meritorious records and equipment. A reduction of 20 per cent in the premium rate was made if the employer had his own system of medical treatment. The rates were subject to still further reduction through dividends for given groups. The State fund eliminated the great economic waste of solicitation for insurance business for, he said, paraphrasing Shakespeare's statement: "None are born insured, some achieve insurance, but most have insurance thrust upon them!" Whether a man insured through a stock company or with the State fund direct, the money for benefits came to the latter anyway. The compensation law was a tax, and why pay an additional tax to a tax-gatherer? Nor was there anything in the argument about the superior service of stock companies because the law would be administered only by the commission. The inspection service upon which reductions for merit will be made would also be administered by the commission through a central bureau.

Mr. Baldwin also believed that the State fund would prove superior to mutual insurance owing to the superior reliability of the fund, no expense for management and no liability of assessment up to 100 per cent. He doubted also whether mutual insurance was desirable for conditions where payments had to extend for more than a generation. The State fund offered to employers in the same business unusual advantages if they would make up a group of say 3000 employees so that they could obtain all the advantages of mutual insurance without its drawbacks. The same prospect of dividends would exist, while in case of trouble the special mutual fund would be backed up by the State fund as a whole. He hoped that the association would see fit to appoint a committee on this subject. Should the mutual group have its own hospital treatment, a reduction of 20 per cent would be made; and for meritorious safety methods and equipment, a reduction of 40 per cent was possible. He did not believe that the State fund would get the bulk of the business at first because of misapprehensions and the misstatements made regarding its purposes, but in time the State fund would come into its own.

Mr. Gonzenbach said that his paper might have given the impression that he was absolutely for insurance in a mutual fund; but the mutual feature in connection with the State fund appealed to him greatly and was worthy of study by the association. He realized that the liability of a catastrophe was decreased by cooperating with the larger fund.

In reply to a question, Mr. Baldwin said that employers whose equipment was below standard would have to pay a differential or penalty rate. In answer to another question, he said that an employer could withdraw from the State fund at the end of a year to insure otherwise if he wanted to. The reference in the law to "liability to assessments" had been left in inadvertently, for the law contained no statement as to its collection, etc.

President Hedley said he had learned a great deal about the law from Mr. Baldwin's remarks. He asked Mr. Baldwin to prepare a statement showing how the mutual plan for 3000 men or more could be applied to the State fund, and promised that this statement would be sent for consideration to all the members of the association. On the motion of J. S. Doyle, he also announced that a committee would be appointed to confer with the commission's men on this subject with a view to deciding upon insurance plans for next year.

APPOINTMENT OF NOMINATING COMMITTEE

After a vote of thanks had been tendered to the speakers of the afternoon, President Hedley announced the nominating committee as follows: E. S. Fassett, J. K. Choate and W. H. Collins.

The meeting was then adjourned.

WEDNESDAY MORNING SESSION

On Wednesday morning J. P. Barnes, general manager Syracuse & Suburban Railroad Company, Syracuse, N. Y., read his paper on "Accident Prevention" scheduled for Tuesday. This was followed by a symposium on "Efficiency," comprising three papers by C. J. Witherwax, general passenger agent Schenectady Railway Company, Schenectady, N. Y.; F. A. Bagg, chief engineer Fonda, Johnstown & Gloversville Railroad Company, Gloversville, N. Y., and W. H. Sawyer, E. W. Clark & Company, New York, N. Y., respectively. These papers were not discussed and on account of lack of time, the questions propounded in the "question box" were not brought up for discussion.

The following were then elected to the offices named for the ensuing year: President, James F. Hamilton, general manager United Traction Company, Albany, N. Y.; first vice-president, John J. Dempsey, superintendent of transportation New York Consolidated Railroad, New York, N. Y.; second vice-president, James F. Barnes, general manager Syracuse & Suburban Railroad Company, Syracuse, N. Y.; secretary and treasurer, Chas. C. Dietz, New York, N. Y.; members executive committee, S. W. Mower, general manager Otsego & Herkimer Railroad Company, Cooperstown, N. Y.; Wilbur C. Fisk, president Hudson & Manhattan Railroad, New York, N. Y.; Ernest Gonzenbach, general manager Empire United Railways, Inc., Syracuse, N. Y., and W. O. Wood, general manager New York & Long Island Traction Company, Hempstead, L. I.

After resolutions of appreciation of the successful efforts of the outgoing officers and of all others who had contributed to the success of the meeting had been passed, Mr. Hamilton took the chair. He expressed his appreciation of the honor and responsibility conferred upon him and adjourned the convention. The total registration exceeded 150.

DIVERSIONS OF THE CONVENTION

Superimposed upon the more serious features already described there was an unusually attractive program of entertainment. The baseball game between the "pedlers" and the railroad men, played off on Tuesday was a star feature. Captains Frank Hedley and C. C. Castle starred as pitchers while W. B. Rockwell was a remarkable first baseman and J. K. Choate shone as a base runner. The score was somewhat in doubt, as Umpire Harry Evans was roughly handled at times. It was finally adjusted at 22 to 21 in favor of the supply men. The high score gives a false impression of the fine quality of the playing. A handsome engraved brass vase has been donated as a permanent trophy. Golf was, of course, the absorbing pastime of the convention. Under the direction of N. M. Garland there were three competitions. The first was for the state association championship, a 19-hole medal play handicap with about twenty-five entries, won by C. R. Ellicott. There were also a blind handicap and a ladies' clock golf competition. There were also informal dancing at various times in the ballroom of the Hotel Champlain, a ladies' bridge whist contest and an excursion to Ausable Chasm. Altogether the splendid weather, the large attendance of ladies and the excellent hotel accommodations combined to make the convention a social success.

THE BANQUET

The banquet on Tuesday night was accompanied by the usual good oratory on the smiling and serious aspects of the electric railway business. W. L. Conwell, vice-president and treasurer Transportation Utilities Company, New York, was the first speaker. He noted the many rapid changes in standards and methods that had been made during a period of rising prices for manufactures but of a fixed price for fares. The public was justified in demanding good service, but the railways must be granted conditions which would give them a just return on their investment after due expenditures for operation, depreciation and obsolescence. He deplored the fact that politics should have injuriously entered into the conduct of a great industry. Speaking in a lighter vein, and as a manufac-

OF THE UNIVERSITY

turer, Mr. Conwell said that the convention afforded the supply men a chance to mingle with the railroaders on other matters than delayed shipments, defective apparatus and unsatisfactory prices. He hoped that no condition that would prevent their attendance would ever be brought about.

E. A. Maher, Jr., assistant general manager, Third Avenue Railway, New York, said that these were parlous days for electric railways. Some railway men thought that public service commissions and workmen's compensation commissions were as useful as a corn plaster to a mermaid; but he felt that such commissions had the possibilities to do great work. The situation as to railroads had changed very much in the past few years. The time was not long distant when those in charge of public utilities had tried to play a confidence game with the public and public officials. Now conditions had changed, for the railways were taking the public and officials into their confidence. Every railway man now wanted to play the game with the cards on the table. He took the position that the public from which every penny of income came was entitled to know what the railways were doing and how that income was spent. The railways must give the widest publicity to their acts to convince the world that there is a community of interest between the railways and the people so that the interest of the people demands that they back up the railways. The period of explaining before government commissions the deeds of bygone days was over. Now the period had come when the railways could explain their acts beforehand and thus prove that they are conducting their business honestly and fearlessly.

President Hedley in commenting upon Mr. Maher's remarks, said that a few years ago the railway owner had not permitted the operator to play the game with the cards on the table, but now it was the kind of a game that they had to play. This change was one of the greatest helps that the railway manager had ever been given. The financiers could no longer flood the operators with securities that did not represent the investment of real money, and it was right that they were no longer permitted to do so.

The last speaker was Howard MacSherry, attorney Public Service Corporation of New Jersey. He opened jocularly by saying that he also was fond of playing with the cards on the table, but he wanted to select the cards. He did not see why electric railway men should be apologizing for their business all the time. They should fight back. Electric railway men should take a more active part in politics instead of permitting irresponsible men who had never shown constructive ability to run the railway business from some government office. If he had a mission to preach it was that business men should take a hand in the business affairs of the nation to protect what they had themselves created.

Power Station Improvements at Danville, Ill.

The Danville (Ill.) Street Railway & Light Company now has improvements under way in its power station which, when completed, will make that station one of the most modern on the Illinois Traction System, of which it is a part. Two 4000-kva, 2300-volt, three-phase, sixty-cycle General Electric turbo-generators will be installed in an addition to the present building. These machines will be among the first 4000-kva units ever manufactured to operate at 3600 r.p.m. The old reciprocating engines which have been acting as reducing valves on the heating system and also supplying electrical energy, will be retained in their present position and operated during the steam-heat season. The new condensing turbines will carry the load during the summer months.

One of the chief engineering problems confronting J. E. Johnson, manager of the Danville company, in connection with these new units was that of condenser arrangement. Two surface condensers with approximately 8000 sq. ft. of surface will be purchased and installed beneath the turbines, the bottom of the hotwell being about 24 ft. beneath the engine-room floor. This floor is about 78 ft. above the Vermillion River so that the circulating water will act against a 47-ft. head. At first, the advisability of digging a 60-ft. pit beneath the engine-room floor for these condensers was considered. This would have reduced the necessary lift of condensing water from the river, disregarding syphon effect, to about 18 ft. However, after some consideration it was decided that the saving would not capitalize a sufficient amount to build the pits and tunnels. It was also thought that the maintenance of condensers in such an inaccessible position would be unduly difficult and would probably be less satisfactory because workmen would prefer not to work in the hot subterranean pit. It was also thought that with the condensers at this low level sufficient circulating water might not be available in periods of drouth. To meet this latter contingency, however, the company intends to build a concrete dam across the river, and with the condensers at their present level the circulating water can be returned to the upstream side of this structure, cooled and used again.

Boston Service Complaint Dismissed

The Massachusetts Public Service Commission has dismissed the complaints of the boards of aldermen of Medford and Somerville, of the city council of Woburn and of the Everett board of trade upon service conditions at the Sullivan Square terminal of the Boston Elevated Railway. The petitioners claimed that the system of elevated train operation at Sullivan Square gave passengers from Malden and Everett an unjust preference over passengers from Medford, Somerville and Woburn. By an order of the Railroad Commission in 1912, the company arranged the operation of its trains at this station so as to permit passengers arriving at the upper or elevated train level from the Malden and Everett districts to board, from the platform previously used for unloading only, such trains as are to be operated around the loop and back into the city of Boston. A three-month trial of this plan convinced the board that the rearrangement of service did not constitute an unjust discrimination, but was necessary in order to give the Malden and Everett passengers facilities at the terminal more nearly equal to those enjoyed by the Somerville, Medford and Woburn passengers. The arrangement has since been in force, and by its means passengers from all points served by upper level cars have been placed on a substantially even footing with respect to the distance necessary to cover in transferring between cars and trains.

Complaint was also made by the petitioners in regard to the crowded condition of cars operating to and from the terminal during the rush hours. In order to relieve these conditions, the company is, in compliance with a suggestion of the board, operating a large number of cars upon its trains over the elevated structure and through the Washington Street tunnel, and is running these trains during certain morning and evening hours as frequently as conditions of safe operation will permit. The board, in dismissing the petition, calls attention to this increased service and points out that the completion of the extension of the Boston Elevated Railway to Everett and Malden will further relieve the congestion of traffic during rush hours.

Papers at the New York State Convention

Abstracts Are Published of the Papers Presented at the Bluff Point Convention by Messrs. Hoey, Gonzenbach, Barnes, Witherwax, Bagg and Sawyer.

EMPLOYEES' ACCIDENT INSURANCE

BY JAMES J. HOEY, SECOND DEPUTY SUPERINTENDENT OF INSURANCE OF THE STATE OF NEW YORK

Employer and employee in this State will assume a new relationship towards each other after July 1. It will be a relationship unclouded by the fear that has always hung over both when there existed the likelihood of injury to the workman and doubt as to the extent and character of the compensation he was to receive.

DEFECTS UNDER FORMER SYSTEM

The old employers' liability law served as an instrument for the creation of mutual distrust between employer and employee. The charge of negligence always brings with it reflections on the person guilty which he is likely to resent. In as much as the employee was obliged to prove not only negligence on the part of the employer but also the absence of negligence on his own part, the question of negligence became a double instrument for the creation of distrust and irritation between the parties.

This distrust and irritation was accentuated by the insurance companies. The employer did not insure his workmen under the old law. He simply insured himself against damage on account of negligence. The insurance companies which undertook the defense of suits had no interest in the future of the injured workmen. They were concerned only in protecting themselves against verdicts, and they employed high-priced lawyers specially versed in negligence law for the purpose of defeating any and every claim presented. These lawyers had but one point of view, the protection of their clients by the extreme exercise of their technical legal skill. To offset the conduct of insurance companies, buttressed by such expert legal skill, the injured workman was obliged to put himself in the hands of other lawyers of equal skill and competence. Consequently, the system of contingent fees sprang up, and in as much as the workman's lawyers could not be paid unless he won his case, the misfortune of the injured man became a pawn in the legal game between two expert attorneys, each concerned only with the question of whether he would win or lose.

Under such a system the old relationship of confidence and friendship between employer and employee was bound to disappear. The employer, instead of looking upon his workmen as wards who needed his protection and assistance, came to regard them in many cases as vultures awaiting the opportunity to pounce upon him as prey, while the employees, on the other hand, grew to look upon the employer as a heartless personage without any regard whatsoever for their welfare or protection.

With the constant creation of legal entities known as corporations to take the place of real personalities as employers, this condition was bound to increase. It was aggravated further by the constant disposition of all classes in this country to do things under high pressure and without regard to the best care and circumspection—a disposition which in recent years has been so much identified with what is known in the United States as progress.

It did not improve the temper of the workman to learn that his claim for damages might be defeated by any one of three defenses, viz., the assumption of risk, negligence of a fellow servant or contributory negligence on his own part. Nor was it consoling to him to know that, even if he had surmounted all difficulties and obtained a verdict, half of his award or more was to go in payment for the skill which his lawyer exercised in winning the case. Economists are puzzled when they attempt to explain why the workmen have been compelled to assume all the risk of their employment and why, because of that hazard, workmen's children are exposed to the danger of becoming public charges. It seems certainly more rational, more economical, to have the cost passed on to the public in the first instance. There is no more reason why the risk assumed by the mechanic while working on a building should not be paid for by the owner of that building than that the time consumed in the making of the bricks for the building should not be paid for by the same owner.

FOREIGN PROGRESS

It is hardly creditable to the United States that Europe is so far ahead in the practical work of providing compensation for workmen's injuries. Germany passed a workmen's compensation act in 1884, and twenty-six countries of Europe have since done the same. The schemes adopted were as varied as the countries adopting them, but the underlying principle was the same throughout. Whether compensation was provided through mutual associations, as in Germany, and Austria, through direct obligations, as in England, through private insurance companies guaranteed by a state fund, as in France, through a combination of both kinds, as in Sweden, or through a state monopoly, as in Norway, the European workman has for years been enjoying the sense of security which the workman of New York will have after July 1.

WORKMEN'S COMPENSATION IN NEW YORK

The fact that New York has not had a compensation law in operation until now, however, has not been the fault of modern enlightened public opinion in this State, because it was the first to adopt a scheme of compensation insurance. This, because of the disposition of the Court of Appeals to interpret super-strictly constitutional provisions that were never intended to apply, was declared to be incompatible with New York's constitution. It has taken five years to correct the defect, and meantime New York has been distanced by Massachusetts, New Jersey, Illinois, Michigan, Washington, West Virginia, Oregon, Nevada and a number of other States, which have adopted as many schemes of protection as there exist in European countries.

It is unnecessary to repeat the history of the efforts to procure a workable workmen's compensation law for this State, of the contest between the labor unions committed to the creation of a State monopoly on the one hand, and those agencies which did not believe the State could successfully undertake such a scheme on the other. The contest, however, resulted in a compromise measure, largely through the influence of Governor Glynn, embracing the best features of both systems but paying to the workmen greater compensation than is paid by the system in force in any other State.

Inasmuch as Governor Glynn was largely responsible for the passage of the law, he deemed it wise to follow its operation closely. Perhaps no five men better qualified to administer such a law could be picked in the State than those selected by Governor Glynn to compose his compensation commission. Robert E. Dowling, whose name stands for business and constructive progress; John Mitchel, whose name is synonymous with the requirements and the progress of enlightened labor; Mr. Darlington, New York's greatest health commissioner; Professor Mosher, educator and lawyer, and J. Mayhew Wainwright, legislator, whose name is identified with the first commission that evolved a compensation scheme for New York. The task which each has to accomplish is difficult. To comprehend, digest and assimilate the variety of actuarial, engineering, manufacturing and administrative questions which will come before them, and to pick out the defects and ambziguities of the law as it stands, whip the corrections into shape and give them concrete expression by the beginning of the next legislative session, is a task calling not only for application and energy but also for constructive ability of the highest order.

MEDICAL SERVICE

The workmen's compensation law provides not only for damages on account of injuries but also for medical service for injured employees during the time of disability. It is refreshing to see that the great organization with which your president, Mr. Hedley, is identified has taken the initiative by providing in advance for this important service. The Interborough Rapid Transit Company has arranged with doctors and hospitals for the care of its injured employees. It has also worked out a scheme which bears the ear-marks of care and study. When a man is injured he reports at once to the first-aid man, a fellow employee, at a terminal shop or power house. It is this man's duty to give the proper first-aid treatment, and then send the injured man either to a local doctor or, if the injury is trivial, back to his work. If further treatment is needed, the employee continues to visit the doctor as often as necessary, and if necessity arises he is sent to a hospital. In the hospital he does not become an ordinary ward patient but is sent to the semi-private ward where he can see friends and relatives at reasonable times and where he does not have to incur the stigma that attaches to a charity patient. If his injury requires special treatment, he will obtain the services of a specialist. At the central hospital massage, baths, electricity and the like will be provided to treat those who have become victims of rheumatism or other ills common to the workman who is exposed to the weather. All these go to make a strong link in the magnificent scheme for the conservation of human life.

RAILROAD ACCIDENTS

The country is now entering on an era of economic conservation of life and property. With the confidence of a young giant, we have been prodigal of our strength, unmindful of the fact that some day that strength might be dissipated. We are waking up. We are realizing that this waste of life and property cannot go on indefinitely, if our future prosperity is to keep pace with our prosperity of the past.

Yet while science has been searching out and destroying the older enemies of man, invention has not provided safety appliances to keep pace with its own creations. The number of accidents on American railroads is a by-word of Europe. Every man injured by a railroad and improperly compensated becomes an agent of discontent among his fellow men, with whom the railroads in the last analysis will have to reckon. Every inadequate piece of rolling stock becomes a piece of evidence in the indictment against efficiency. Every unprotected mile of roadbed makes for the propagation of the spirit of ill-will towards the company that maintains it.

To accomplish safety, to bring it to its highest state of perfection, organization is needed. The schools also must be utilized, and the young people taught what to do and how to do it in order to protect themselves. Yet a higher duty devolves upon the railroads, a duty which must find its practical expression in the adoption of the most up-to-date methods of safeguarding life and limb.

The disposition of woman, for example, to use her right hand in alighting from a street car, acquired congenitally through a long line of female ancestors who did sewing and household duties with their right hands while their lefts were practically neglected, cannot be corrected in a day. You cannot correct this disposition by any number of educational pictures. The trouble is too deep for such a superficial remedy. The evil can only be obviated by providing a means which makes the use of the right hand under the circumstances unnecessary or impossible, and by instituting a radical and thorough system of education. You can begin with the young girl in school. You can train her to acquire proper habits; you can teach her how to use her hands in order to protect herself. But the process of education has to be undertaken before the habit predicated on a natural tendency is acquired.

EDUCATION OF EMPLOYEES

The most necessary of all educational work, however, is the education of your own employees. Every motorman, every conductor, every trainman is familiar with the causes of accidents. Many of them have worked out in their own minds methods by which these accidents should be avoided. Experts tell us that only 15 or 20 per cent of the accidents caused by machinery can be prevented by the adoption of mechanical appliances. It follows, therefore, that if we are to cut the number of accidents in half, the remaining 30 or 35 per cent must be prevented by means of education.

In the old days conductors and other employees of railways received bonuses based on the amount of their collections and the time made on each trip, and more recently they were rewarded for their economic use of electricity. In the future they will get rewards for minimizing the number of accidents. Such a system has been established by the United States Steel Corporation and remarkable results have flowed from it. Each mechanic is given to understand that every scheme of safety he invents to make the operation of his own machine safer is going to be recognized by the payment of periodic bonuses for the prevention of accidents. By this means each mechanic's talent for invention or adaptation is stimulated and the company has the advantage of all this otherwise undiscovered talent, perhaps genius, which it pays for only after results have been accomplished. The stimulation of this talent improves the mind of the workman, creates a stronger binding tie between him and the company; saves him from dangers to which he would otherwise be exposed, and protects his family and the company, which would suffer an economic loss were he to be replaced by an inexperienced and untrained man.

This is a plan which steam railroads and electric railways can copy with advantage. New trainmen should be trained in a well-equipped school maintained by the company. Their latent talents should be developed, their suggestions heeded, their schemes put into practical effect, and, if the scheme prove useful, the members should be remunerated.

It is the general impression that the companies have heretofore acted on a wrong theory in their dealings with the public. Stockholders have been greedy for dividends, officials hungry for large salaries. For that reason the trainman was paid a minimum wage and was instructed to bring his car in on time irrespective of public safety, injuries meant only lawsuits to be defended to the last ditch, old equipment was maintained long after safer and better kinds had been evolved and long after it had been demonstrated that the adoption of the safer and better kinds would mean an ultimate saving to the company. Safety, however, is going to be the watchword of the next decade. Safety is economy. The railway which does not adapt itself to the new idea will run the risk of having its property condemned and turned over to public ownership and operation. The country is not ripe for this step, but the public is sometimes impatient. Such impatience can be controlled by good service by the companies and in no other way. Good service means safety to the public and to employees.

A PLEA FOR MUTUAL EMPLOYERS' LIABILITY INSURANCE

BY ERNEST GONZENBACH, GENERAL MANAGER EMPIRE UNITED RAILWAYS

Knowing that I have been living in the State of New York less than three months and am not yet really established solidly in my new work, it seems to me that I was somewhat presumptuous in accepting this invitation to discuss the subject of employers' accident insurance. Nor have I become as yet familiar with the details of the New York compensation law which became effective on July 1. Therefore I will not pretend to discuss the merits or demerits of the law as it stands on the statute books. My object is to make a plea for mutual insurance, and the subject has been assigned to me presumably because I have just recently passed through the experience and ordeal of operating a public utility, with all its advantages and disadvantages, under a workmen's compensation law.

For a number of years past I have been located in the State of Wisconsin and that State passed a workmen's compensation law which went into effect on Sept. 1, 1911. In order to understand clearly my viewpoint as to mutualization of risk, it will be necessary for me to give you a short summary of our experiences in the State of Wisconsin. At the time the law was before the Legislature all the manufacturers and employers generally very bitterly fought it but did not succeed in materially changing its provisions, and when it became effective it was by many considered a detriment and a burden on the industries of the State. This view was still further intensified when we received the stock liability insurance companies' new schedule of rates covering risks under the workmen's compensation law. The rates for all classes of employees were increased in prodigious amounts, but particularly was that the case in the public utility business. A few months of actual experience under the compensation law soothed our ruffled feelings, and I think I am safe in saying that a large percentage of employers found that settlements under the new law were more satisfactory to both employer and employee. On the whole the law has won much favor. The New York law is more drastic, I am told, than the Wisconsin law and its administration, it is feared in some quarters, will give cause for some dissatisfaction. However that may be, I can only wish for the New York law the level-headed and fair administration which has made the Wisconsin law a success and a source of great satisfaction to both sides. May the New York law be equally detrimental to the shyster and the ambulance chaser.

The manufacturers of Wisconsin found their way out of the dilemma by organizing the Employers' Mutual Association, which has been working successfully and to their great advantage. It is one of the best-administered concerns of its kinds. The public utility operators, and particularly the electric light and electric railway people, were not in as fortunate a position. For one thing, their rates had been increased in proportion greater than that of any other class of employers. Electric lighting employees were increased 124 per cent, city street railway employees were increased 650 per cent, and interurban employees 1100 per cent. This increase was partly due to the fact that up to 1910 the liability insurance companies had been actively soliciting business and competing in rates, whereas shortly after that a uniform scale was established and the percentage of increase as compared with this uniform scale would not appear quite as large. Stimulated by the comparatively low rates and good service which competition had forced onto the stock companies, few companies had attempted to carry their own insurance, and the sudden rise in rates therefore seemed all the more a burden and threatened to wipe out the all too slender balances of many a company. The consequence of the prohibitive rates naturally was that most companies cancelled their liability insurance as fast as policies expired, preferring to carry their own risk. But the stock companies had another trump card in their hand. While it has never been possible for electric railway companies to get public liability insurance, such insurance has been issued regularly to electric light companies, and almost every electric light company carries such a policy and considers it essential; in fact, such public liability insurance in electric lighting companies is much more important than employers' liability insurance. When the electric light companies of Wisconsin began cancelling their policies the stock companies refused to issue public liability policies unless the companies also carried employers' liability. This was a club held over the head of the smaller companies which forced many of them to accept the very high rates of employers' liability insurance, which they paid in preference to losing liability insurance altogether.

Confronted by this situation the Wisconsin Electrical Association appointed a committee, of which I had the honor of being chairman, to find a way out of the difficulty. After a year's deliberation and a great deal of discussion it was decided that the electrical companies in the State form a mutual insurance company, the administration of which was to be in the hands of the Employers' Mutual Company, formed by the manufacturers of the State, and which would be administered by that company and the cost of administration pro-rated on the basis of cases handled and compensation paid. The electric companies, however, were to form a separate and distinct class with their own reserve fund, and we were in no way to participate in either the risks or profits of the general funds belonging to the manufacturers. The administration of the fund was to be in the hands of the electric companies entirely. The point of advantage of this arrangement is in the fact that while manufacturers and electric companies each carried their own risk, the cost of administration and all overhead charges were shared by a larger number of risks, with consequent reduction of the unit costs. So far as I know this plan is being put into effect now. In view of the situation now confronting the electric railway industry of New York State I believe that I have been justified in mentioning the experience of the Wisconsin association here.

The general tendency among the larger companies in the State of New York seems to have been to declare their intention of carrying their own liability insurance, under the State law which went into effect on July 1. In view of the large size of the companies which make up the majority of operating properties in this State this may be the best policy. There seems to be no doubt whatever that the employers' risks involved in the street railway business are very much less than they are in most manufacturing interests, or than they are in contracting and construction work. Furthermore, the element of general risk in the street railway business is naturally very great and is infinitely greater in the case of the public than it is in the matter of injury to employees. Employers' liability is a small fraction indeed of the risk which every company in the railway business incurs and carries continuously. Many companies ignore employers' liability entirely, and this justly so when one considers the enormous risk in public liability which the business involves. This, however, it would seem to me is only a further argument in favor of mutualization. Under the new law we must, if we carry our own insurance, provide a reserve in funds for carrying this insurance, or we must pay rates to stock liability companies or to the State which, in the opinion of most of us, seem exorbitant and higher than the risk warrants. Is there not reason why we should share this fractional risk involved in the carrying of our employers' liability?

THE OPPORTUNITY FOR CO-OPERATIVE INSURANCE

We have for many years been talking of co-operation in the electrical fraternity. We have an Electrical Development Association which is continually preaching to us "co-operation." We have committees of various national associations which have presented the subject of co-operation before their respective bodies, where the slogan has aroused much enthusiasm. We have an electrical secret society and it is no breach of obligations to disclose the fact that their principal object is co-operation.

We are now confronted by an opportunity which enables us to put into practice the many nice things we have said about each other and the many good deeds we have promised ourselves to do. This opportunity comes to us through the possible mutualization of employers' liability risks. By sharing our risks it is, of course, within the range of possibilities that we may assume some risk slightly greater than ours, judged on the basis of past records. However, very likely the other fellow thinks that he is assuming a greater risk by going in with us. I do not believe that a past record is altogether a criterion on which to base liability risks, for it is a well-known fact that many a road having an absolutely clear record covering a period of years has suddenly met with a series of accidents which proved exceedingly burdensome and costly. It is an axiom in the insurance business that the larger the distribution of the risk the greater safety to the insurer.

There is not one company in a hundred which feels strong enough and able enough to carry its own fire risk. Any company which does so, carries its risk at an expense in capital investment and reserve fund which is jealously guarded and of a sum ample to cover possibilities. We have splendid examples of mutualization in risks in the fire insurance business. There is not a better class of insurers than the Senior Massachusetts Mutuals. One of the stock arguments urged against mutual fire insurance companies and mutual companies of all kinds is the fact that the risk is distributed over too small a number of individuals. Such an argument would have no bearing whatever in the case of employers' liability insurance which we are now discussing because we are insuring a small part only of the risk which each company carries individually and must continue to carry. If fire insurance in stock companies is a good thing, then employers' liability insurance in stock companies is a good thing; if fire insurance in mutual companies is an accomplished and successful procedure, then employers' liability insurance in mutual companies can be made so, and it would seem to me that there is ample talent and financial power among the railway operating companies of New York State to organize and administer a mutual employers' liability insurance fund in such a way that ample justice will be done and that fair rates will be charged. Mutualization in New York is further facilitated by the fact that the State assumes the cost of administration of mutual funds for a period of two or more years. The companies I represent have had an exceptionally clear record in carrying their own employees' risks. We do not hesitate to continue to carry our risk under the new law, but we stand ready to help along the cause of mutualization and would be glad to see a mutual organization established to carry the workmen's compensation liabilities of the electric railways of New York State.

ACCIDENT PREVENTION

BY JAMES P. BARNES, GENERAL MANAGER SYRACUSE & SUBURBAN RAILROAD

The subject of accident prevention is too vast for any one paper, or any one discussion, or even, it would seem, for any one volume or library of volumes. It is, therefore, to one phase only, and only one side of that phase, that we must address ourselves. The recently enacted workmen's compensation law of New York State is, in essence, the culmination of a series of attempts to reconcile cause and effect in this matter of accidents and their resultant effects and to transfer from the individual to the industry itself the burden of accidents incident to the conduct of that industry.

Fundamentally our question of accident prevention reduces itself to terms of industrial improvement, more particularly safeguarding. As the public mind to-day is so engrossed by the matter of accidents to employees, it would seem pertinent to direct our discussion to the prevention of this particular kind of accidents, in other words, to the safeguarding of an industry with respect to its employees rather than to the public which it serves.

Usually criticism is ill-advised and unwelcome unless it is constructive in character. The various laws under which the remedy of hazardous conditions has been attempted have been critical and have, in the main, aimed at constructive measures in such matters as safeguarding of machinery and the like. It has been and still is all too true that the employer, generally speaking, has resisted the enforced installation of various safety devices, calling for an outlay of capital and in some cases a slowing down in the rate or reduction in the amount of output. Many an employer is not big enough to see over the top of his payroll, or broad enough to see around it. Upon him the broad humanitarian aspect of the situation is lost or distorted.

But it is the fact and not the theory with which we have to deal; it is the operation and not the inception of the various so-called "labor laws" which concern us in this discussion. Looking back over the years to the time before the injection into the laws of the words "compensation" and "liability" we see a definitely marked tendency toward the standardization of conditions in the shop and factory through the activities of the State labor department and particularly the bureau of factory inspection. This standardization took the form of compulsory guarding of woodworking machinery, punch presses, belts, gears and similar equipment, together with the installation of signs of various sorts designed to promote safety of operation and prevent panic from various causes. Much of this work was good and of a real constructive character, but to one tendency of it in particular I desire to direct attention. As the various safety devices multiplied and increased and were installed under compulsion, often in direct opposition to the will and desire of the workman himself, the individual most affected, the tendency grew to disregard the human factor still further—to say under any set of conditions "do thus and so," regardless of surrounding conditions which were often fundamentally different. Yet these conditions were frequently the determining factor in the success or failure of the particular device or method.

It is an axiom that an unguarded machine, with a careful operator, is much safer than a guarded machine with a careless or incompetent operator. It is equally true that many careful and reliable operators find the liability to accident actually increased by the addition of guards, which are often cumbersome and inconvenient and which sometimes in themselves constitute a very real hazard.

Of these things our laws have taken no cognizance, saying in effect, "A workman is a workman and must be protected always and in the same manner, regardless of what his qualities are as an individual." I wish to call attention to this tendency of the operation of our laws without over-emphasizing it and, at the same time, without minimizing its importance. Standardization of conditions is on the march and the vanguard has already arrived. Therefore let us waste no time in idle discussion of its merits, or demerits, but study rather how best to meet those conditions that are with us as well as those that are surely approaching.

Accidents are accidents only in name. An accident is a perfectly logical and proper result of some particular cause or set of causes. Every accident is a logical succession of cause and effect, and in this sense no accident happens accidentally. Now, any effect which is the result of a definite cause or causes can be controlled if the causes can be controlled. Our remedy, then, is to seek the causes of our industrial accidents and to remove or modify the causes, so that they will result not in that undesirable effect that we call an accident, but in that desirable effect which we call safety.

Remembering that we are dealing here with the industrial accident, or more specifically with the accident in which the employee rather than the public is the victim, we can definitely fix the cause of a large percentage of such accidents under the general heading of "carelessness." The cause may be the carelessness of the injured workman himself, or of his fellow workman, of a bystander (especially is this true in out-of-door work), or of the supervising officer or employee, but, broadly, if everyone concerned were thoroughly careful, most of the accidents of to-day would be avoided.

In this one matter of carelessness lies the most prolific cause of accidents, and the trait of carelessness is fundamentally a part of the human character. Everybody is careless to some extent about some things. Eliminate carelessness and you have eliminated the larger proportion of all accidents by the one means.

Our analysis then brings us to the conclusion that by far the most prolific cause of accident lies in the action of that group of forces which we describe as "human nature." Does the problem then become one of altering human nature? No; rather of redirecting the forces and bringing their action to bear along different lines and to different results than the present methods evoke. Philosophers have remarked, and no contradiction has yet been very successfully offered, that human nature is pretty much the same whenever and wherever you find it. Since we have then an old and well-established force to deal with, one which tends to proceed pretty much along the same lines on successive occasions, it is obvious that we must change the surrounding conditions in order to change the result in as much as we cannot change the actuating force.

Consider for a moment the action of the body that has been most conspicuous, perhaps, in the reduction of industrial accidents in recent years, the United States Steel Corporation. Conspicuously located at the Gary plant of the Illinois Steel Company is a stereopticon flashing such warnings as "Remember it is better to cause a delay than an accident." Exhibits of unsafe tools taken from the hands of workmen form a conspicuous part in this company's plan of campaign. Safety devices and guards on and about machinery have also formed an important part of this campaign, but personal attention to the little matters of safety, as well as the large ones, has played a most important part in attaining success.

Our most important and essential problem in dealing with these matters is that of reaching, and reaching in the right way, the personality of each man on the working force. Primarily men must be careful, careful for themselves and careful for others if real results in accident elimination are to be obtained. Different men are of different minds and open to different manners of approach, and the successful preventer of the industrial accident will be he who studies, knows and wins the confidence and loyalty of his men.

Incidentally many other good things will accrue to the credit of the man who scores in the prevention of accidents because the loyalty, good-will and co-operation which form the basis of successful accident prevention form also the basis of economy and efficiency in the every-day routine of operation.

Good will feeds upon good will and grows larger and stronger thereby. When the millennium arrives that plant or business which shall bear the designation "successful" will also bear as conditions precedent to that success the designations, "square, upright, careful and humanitarian."

EFFICIENCY

BY CHARLES J. WITHERWAX, GENERAL PASSENGER AGENT
SCHENECTADY RAILWAY

Efficiency that has assumed sufficient proportions to make it perceptible in service rendered to a critical public is undoubtedly the result of that kind of influence that makes for co-operation and a desire to serve. This cannot be contained in one man but must be persistently permeating the various departments of an organization from top to bottom. A combination of men, imbued with a spirit of responsibility to their employers and the public they serve, will quite readily develop sufficient energy and leadership to overtake at least the reasonable demand now being made for greater efficiency.

The successful railway managers and operators are those equipped with powers of discernment, not only in stock, bond and dividend values, but in the signs of the times. The growing man cultivates his job, has constructive curiosity. He reaches out in all directions for information and capitalizes it for practical purposes. He realizes that these are days of investigation and explanation. With his broadened view he has almost obliterated departmental independence, for he feels that true efficiency demands that the component parts of an organization have the same common tendency. If he is observant, he soon discovers that a rule is not a rule but a reason. He often substitutes application for vacation, or uses the vacation as a means and not an end. Men as well as nations show better results from continual application, efficiency being lost in too much relaxation.

Efficiency is not a career. It is a cheerful, mental and moral feeling of obligation towards a given end. In the passenger department of an electric railway it is that kind of attitude that begets business and favorable comment, which means more business, turning verbal brickbats into nickels. This applies to every department of railway business, but especially to the transportation department, because that department furnishes by far the greatest number of points of contact with the people served. It must be remembered, however, that one can sometimes stand too near the woods to see the trees. He must go to the hilltop to get a good perspective. I have sometimes wondered whether men in the train service might not be standing too near themselves, thereby missing the real view and the many opportunities which they have to distinguish themselves for personal efficiency and regard for the company's interests.

Building and operating a railroad involves great risk. Rails once laid cannot be taken up except for betterment, and no railroad that is not making money can be sold except at a sacrifice. Men capable of inaugurating such enterprises and carrying them to successful conclusion must have knowledge of the past, discernment of the present and imagination of the future. Their executive ability depends upon their power to have their work well done by others. The greatest difficulty is in the prevention of economic waste, one of the largest items of which is the supervision made necessary by carless employees.

EFFICIENCY

BY W. H. SAWYER, VICE-PRESIDENT E. W. CLARK & COMPANY MANAGEMENT CORPORATION

The term efficiency, as it is generally used to-day, means, as I understand it, a maximum of result for a minimum of effort. The scientific theory of practical efficiency is as sound as science itself, but as in all such movements one particular industry, such as the electric railways, must take only that which is practical for its own conditions. Efficiency as it has been applied and is being applied to electric railway management and operation, and as I shall speak of it to-day, is efficiency born of stern necessity—efficiency which has been compulsory in order that our electric railway systems might survive and exist—efficiency which is still compulsory, still a necessity. As applied to electric railways, efficiency is, to my mind, what you and I know as good management—nothing more, nothing less.

During the period from 1902 to 1912, the efficiency of electric railway operation increased to an extent that would not have seemed possible, let alone probable, ten years ago. The cost of living during this period has increased, say, 40 per cent, coal has increased in cost, say, 20 per cent, and taxes several hundred per cent. The revenue passengers carried by street railways have increased approximately 100 per cent, while the transfer passengers have increased approximately 143 per cent. During the last five years, with large and efficiently operated companies, the costs of operation of the power plant and the costs of injuries and damages show the greatest decreases. Maintenance and platform wages show the largest increases.

Possibly some of us have this efficiency idea too strongly in our minds. Efforts toward efficiency must and should be based on cold-blooded business. True efficiency means net saving, taking into account all things of to-day, to-morrow and hereafter, and the efficient manager proceeds slowly and cautiously. He knows that the expenditure of good money should not be made until he is reasonably certain that the new expenditure is warranted, after taking into account the financial resources of the company as well as the fact that many claims which look well on paper do not help to pay interest on investment, let alone dividends. Let me state that old truism to the effect that even a poor manager may show a good operating statement if furnished with sufficient new money, but that the best managers are those who, with a minimum of new money, produce satisfactory results, and this is especially true to-day, when the primary thought should be to conserve present investments.

Our efforts must be to make the best possible use of existing equipment before we figure the saving on new equipment. Efficiency methods as generally understood should be conservatively and cautiously dealt with, for the margin for error in electric railway problems is so slight, if it is not actually a minus quantity, that before proceeding along radical lines we must make more than reasonably sure that the net effect of the change is for the better.

The efficient manager spends, but he spends wisely. Economy is not necessarily efficiency, and buying second-hand or lower-quality material or laying off men is often not even economy. It is poor economy to rewind an armature and then put it out in service without a high-potential test. It is efficiency to attend to maintenance and repairs when needed—not before and not after.

The question as to what percentage for fixed charges and profit justifies expenditure of money depends first of all on the certainty or uncertainty that the estimated percentage will be really saved. The manufacturer generally sees to it that the savings are all included in the estimate. We must all experiment to a certain extent, but not without first thoroughly appreciating the possibilities of the results of the expenditure. A new device that looks and reads well may, if bought to-day, have to be superseded by a different one five years from now. This, if true, means 20 per cent for supersession alone. The electric railway owner is not looking to-day for ways to spend more money, except as such expenditure is necessary to protect or better present investment. Generally speaking, any new device must show at a minimum at least 20 per cent for fixed charges and profit, and unless one can see estimated profits at least twice as much to justify the expenditure, the safer rule is to do without the expenditure.

Efficiency is, of course, relative. When we fall below the average of comparative companies, we cease to be efficient in the true sense of the word. The pace set in the electric railway industry is a fast one, necessity is ever present, and he who is truly efficient must lead and not follow. It is not true efficiency to have any one department far below par, even if the property as a whole is up to the average. Moreover, the man and the company are often judged and criticised for its weakness, and true credit is generally not given to those departments that are above par.

Definite, correct, detailed, analytical, comparative records are not useless red tape, although even these may, of course, be overdone by needless detail and complications, but without such records no official can hope to be efficient. It is by means of these comparative records that the weak spots can be found and given thought to, until the once weak spot is eradicated, with always, of course, others needing attention. The records must be so carried out and analyzed in detail that the weak spots in the operation are clearly apparent when fair comparisons with previous years or with other companies are made. It is not enough to know that maintenance is higher than it should be; we must know just what details are high before we can correct the cause.

It would not be fair to stop on this question of efficiency after simply reviewing the past and the present and pointing out the necessity for further efficiency. The real question is, in what way can we, from now on, do the most that can be done to make our electric railways more efficient? I can but bring home to you the old answer, though it was never more appropriate than now. Individuals can do their best, can give their very heart's blood, as it were, to the detailed problem, but the greatest good to the greatest number is brought by efficient co-operation—co-operation of local employees by company sections, formal or informal—co-operation between groups of companies, as illustrated by this association—co-operation between all of us, company employees, company officials, manufacturers, engineers, technical press, and the multitude of others all interested in electric railway prosperity.

The electric railway associations are working along proper lines in their endeavor to co-operate with the public for the benefit of the public and of an industry whose continued prosperity and advancement is necessary for the public good, and with the vast amount of efficiency work that is done to-day by the larger companies—with the many reports and papers on the subject—I believe that the greatest cause of inefficiency to-day is that we do not take full advantage of the efficiency of the other man or the other company. If there is one thought more than another that I want to strike home this morning, it is that of the efficiency of co-operation, and, in order to get this, we must keep in detail comparative records and use them to continually check ourselves against the other man. The electric railway industry needs our best endeavors, and these cannot be given efficiently unless all of us, individually and collectively, co-operate through our electric railway associations.

EFFICIENCY

BY F. A. BAGG, CHIEF ENGINEER FONDA, JOHNSTOWN & GLOVERSVILLE RAILROAD COMPANY

Efficiency as applied to railroads means in our minds the managing of the properties and the carrying on of all of the work of the different departments in as economical a manner as possible, and by this means showing a favorable operating ratio and producing as large dividends as the property is capable of. This we have always supposed meant efficiency, and it has not occurred to most of us that there could be any other kind of management. Within a few years, however, the normal progress of civilization, together with the economic needs of the times, has brought into prominence a new idea, a new interest called scientific management.

[Mr. Bagg then outlined the fundamental principles of the Taylor system and referred to the writings of C. B. Going, Harrington Emerson, Frank B. Gilbreth and F. W. Taylor. He also described briefly the "unit system" of management, devised by Major Hines and used during the past few years on a portion of the Harriman lines. He also mentioned the criticism of the steam railroads for their waste of labor and materials, resulting in low efficiency.]

If it is true that there is such waste on steam railroads our electric railways may well be suspicious that there may be waste not now apparent that might be saved by the adoption of some new ideas of management. According to Mr. Emerson we should search for such waste in the labor and material accounts.

I have no complete and ready-made plan to offer that can be "clapped on" to any electric railway and which will show a marked decrease in the operating ratio in the next annual report. During some years of employment on public works and steam and electric railways I have, however, observed some conditions that appeared capable of improvement.

In the first place, any new plan must come from the top. Subordinates are apt to believe that suggestions and much initiative are not usually encouraged, hence the whole organization should be given to understand that the higher officials are ready to encourage anything that will stop waste and increase efficiency. The ignoring of such suggestions as those relating, for example, to the location of a power house with respect to high water, to the proper width of a roadbed, to the proper angle of slope in cuttings, to the best location of a portion of track, etc., is always costly to a company.

The management organization should be so complete, or should be made so by the addition of the necessary staff officers, that the work in all departments can be thoroughly covered and ample time afforded for studies and investigations designed to increase efficiency. Every year the railway and allied associations gather a great deal of valuable material, make recommendations and prepare standards, of value if followed. The regular line officers whose time is taken up with routine work may or may not be aware of these recommendations and when they do it may require special effort to convince the management that the recommendations should be adopted. The proper way is to make it the business of some one or some staff to investigate and determine from time to time those improved methods or plans which are worth taking up.

Why is it that private individuals and contractors can do work or conduct business cheaper than can a railroad or other large corporation? My observation shows that successful contractors have the best equipment and well-paid assistants who work under the concentrated attention of the contractor himself. Often the railroads cannot have as strong construction or maintenance organizations because they must get along with inferior or insufficient equipment. Fewer superintendents and foremen are sometimes provided and they are paid less for their work. This is not true with the labor item when the restrictions are removed. The saving in poor supervision is more than lost in the larger payrolls. A contractor told me that he wants his foremen to spend a dollar whenever they can save two, but this is not usually the case with railroads.

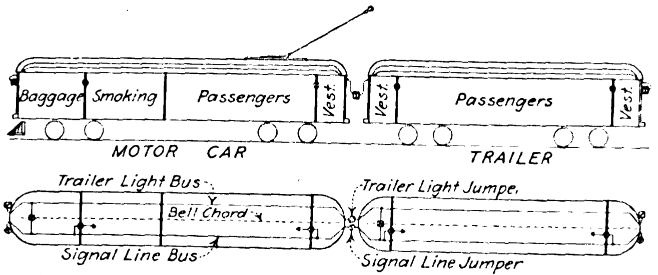
Two illustrations of the application of the last-named principles may be of interest. In one case a railroad secured very great improvement in track maintenance at low cost by a 25 per cent increase in the track force. In another case an expenditure of $2,700 in eliminating defective bonds saved $3,700 in the power bill in two years.

Consider the application of the principles of better management to the case of the maintenance of way department of an interurban line. This work is often done after a fashion followed for years. A good practice would be this: As spring arrives shims are removed, the track is fixed up where necessary and new ties are put in here and there. This work should be finished early in the summer. Then come mowing, weeding, ballasting, lining and surfacing, and later ditching and preparation for winter. On how many lines is such work done in accordance with a well-planned schedule and under the complete and constant control of the track supervisor? Too often the decision as to the number of ties is left to the guess of the section foreman and cut arbitrarily. During the period of tie replacing the track supervisor can save his wages by preventing the removal of ties still good for a year or two. All ties should be in by a certain date, say July 1, and the track ready for summer traffic. A schedule should be prepared in advance for the season's operations and it should be rigidly adhered to. The track supervisor should be on the line constantly, keeping the track gangs up to schedule and following up and remedying the causes of delay. In the fall the tie requirements for the following year should be accurately determined to insure prompt delivery. This procedure would result in better control of maintenance work at less cost.

Proposed Standards of the Central Electric Railway Association

At the convention of the Central Electric Railway Association held in Toledo last week the report of the standardization committee presented a number of important recommendations. These were given in abstract in the ELECTRIC RAILWAY JOURNAL for June 27, page 1454. Details of the recommended changes are now available. As reported in the account of the meeting, the report of the committee on standards was accepted as presented by the committee and the secretary was ordered to send copies of the report to the individual members of the association for final action at the next meeting. This will be held in Indianapolis some time in November, so that ample time is afforded for consideration of the recommendations.

In its report the standardization committee recommended the adoption as "recommended practice" of the standard 6-in. trolley wheel which was tentatively submitted before the association a year ago. This wheel is 6 in. in diameter over all, has a hub 1¾ in. long and has a groove with a maximum width of 1⅛ in. and a minimum width of ½ in., the depth of metal at the bottom of the groove being ½ in. A drawing of this standard trolley wheel was published in the ELECTRIC RAILWAY JOURNAL for July 26, 1913, page 140.



⊗ Signals, with necessary resistance, to be located so as to be audible on both sides of bulkheads.

⊕ Signal line connectors, as per print No. B-11-A.

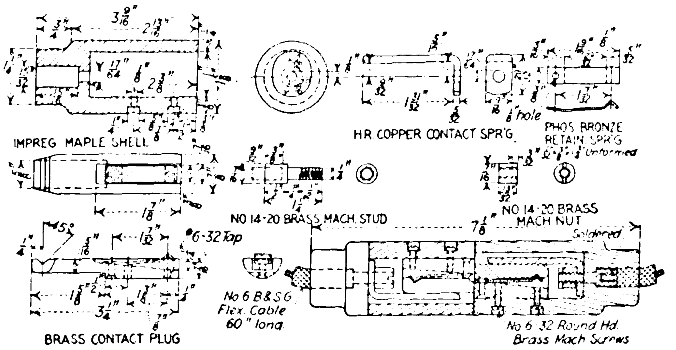
⊠ Trailer light connectors, as per print No. C-5-A, used for light heater and other auxiliary circuits.

■ Signal sws. operated by bell cord and connecting trailer light with signal line bus.

C. E. R. A. STANDARDS—PROPOSED LOCATION OF ELECTRO-PNEUMATIC SIGNAL WHISTLES AND WIRING

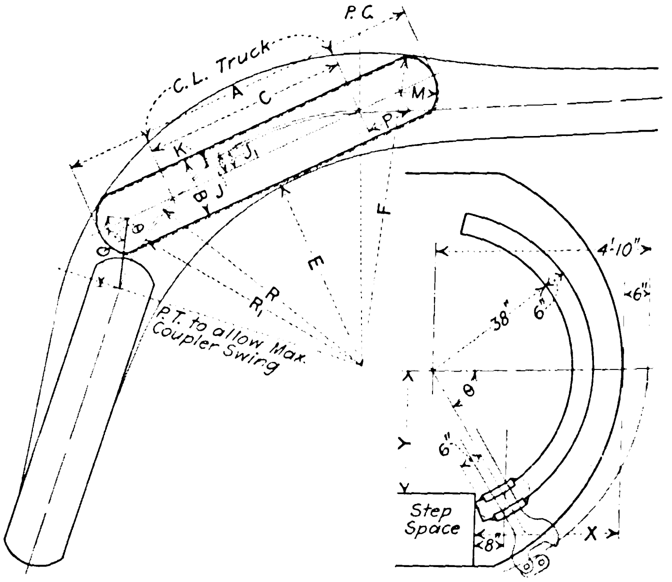
In connection with the standard train signal system the committee proposed a standard arrangement of electromagnetic signals for car interiors. The report did not go into details regarding the location of the accessory apparatus which would necessarily have to be determined by local conditions, but defined the location of the signal whistles so that they could be readily heard by trainmen from any part of the car. This proposed arrangement is shown in the accompanying cut.

The committee considered that it was advisable to use a connector for the signal line between cars which would not intercouple with the trailer-light connector, and in view of the fact that the present standard trailer-light connector had been found to be of insufficient current-carrying capacity, especially when electric heaters were employed, it was recommended that the present standard trailer-light connector, as reproduced in the ELECTRIC RAILWAY JOURNAL for July 1, 1911, page 32, should be adopted as a standard signal-line connector. The committee then recommended that a new standard trailer-light connector be adopted in place of the old one. The details of this are shown in one of the accompanying line cuts.



C. E. R. A. STANDARDS—PROPOSED NEW STANDARD TRAILER-LIGHT CONNECTOR

With regard to the standard end connections for interurban cars, the committee recommended the revision of the present arrangement to provide for the additional line as mentioned above. This arrangement was shown in an illustration in the ELECTRIC RAILWAY JOURNAL for July 5, 1913, page 30.



C. E. R. A. STANDARDS—DIAGRAM SHOWING CLEARANCES OF CAR BODIES AND ANGULAR SWING OF COUPLERS

In connection with the discussion on the subject "Mounting of Radial Couplers," the committee submitted for inclusion in the proceedings of the association a table prepared by the Ohio Brass Company which showed the clearances of car bodies and the angular swing of couplers when two-car trains were passing around curves of short radius. This table is published below in condensed form, the most important features in it being given. It applies only to curves with a radius of 35 ft. and to cars that have a bumper beam radius of 5 ft., an overhang between the bolster and the bumper beam of 11 ft., and a projection of the coupler pulling face 6 in. beyond the bumper beam at the center line of the car.

CLEARANCE OF CAR BODY AND ANGULAR SWING OF COUPLER FOR 35 FT. CURVE AND 11 FT. OVERHANG

GENERAL CAR DIMENSIONS			Radii of Car Clearance Lines for Car Positions Entirely on the Curve		4 FT. 10 IN. M.C.B. COUPLER DATA 6 IN. PROJECTION OVER BUFFER CENTER LINE		
Length Over Buffers	Width	Truck Centers			Angular Swing of Coupler from Car Center Line	Clearance in Inches from Step to End of Car	Clearance in Inches from Step to Car Center Line
A	B	C	Inside E	Outside F	Θ	X	Y
70 ft.	10 ft.	48 ft.	20.14 ft.	44.36 ft.	86 deg. 42 min.	57.64 in.	36.40 in.
65 ft.	10 ft.	43 ft.	22.31 ft.	43.96 ft.	79 deg. 22 min.	52.43 in.	30.27 in.
60 ft.	10 ft.	38 ft.	24.11 ft.	43.59 ft.	72 deg. 15 min.	47.51 in.	33.70 in.
55 ft.	10 ft.	33 ft.	25.59 ft.	43.19 ft.	65 deg. 22 min.	42.92 in.	34.19 in.
50 ft.	10 ft.	28 ft.	26.81 ft.	42.79 ft.	58 deg. 56 min.	38.85 in.	33.43 in.
45 ft.	10 ft.	23 ft.	27.80 ft.	42.40 ft.	52 deg. 18 min.	34.92 in.	31.92 in.
40 ft.	10 ft.	18 ft.	28.53 ft.	41.99 ft.	45 deg. 48 min.	31.42 in.	39.74 in.

NOTE: A decrease in width of car to 8 ft. increases value of E by 1 ft. but does not affect value of F.

The formulas from which this table was made up are given below, the terms used in these being shown in the accompanying diagram.

R = Radius of center line of track curve

Wb = Distance between wheel centers on truck

K = Distance between center line of track and center of truck, when truck is on the curve.

$$K = R - \sqrt{R^2 - \left(\frac{wb}{2}\right)^2}$$

$K = 0.23$ ft. when $R = 35$ ft. and $wb = 8$ ft.

$$R_1 = R - K$$

$$J = R - \sqrt{R^2 - (C/2)^2}$$

$$J_1 = R_1 - \sqrt{R_1^2 - (c/2)^2}$$

$$E = R_1 - J_1 - \frac{B}{2}$$

$$F = \sqrt{\left(\frac{A}{2} - M\right)^2 + (R - J)^2} + M$$

Angle of coupler swing, $\Theta = 180$ deg. — (angle L + angle N)

$$L = \text{angle whose tangent} = \sqrt{\frac{R^2 - (c/2)^2}{\frac{c}{2} + P}}$$

$$N = \text{angle whose cosine} = \frac{c \times p + Q^2 + P^2}{2Q\sqrt{R^2 + (C \times P) + P^2}}$$

$$X = 5Z - 41 \cos \Theta + 8 = 60 - 41 \cos \Theta$$

$$Y = (52 - X) \tan \Theta + \frac{6}{\cos \Theta}$$

$$= 41 \sin \Theta - 8 \tan \Theta + \frac{6}{\cos \Theta}$$

The results given by these formulas are expressed in feet. The values of E and F give the radius of the clearance lines for the car under consideration when the car is wholly on the curve. The clearance lines draw in toward the track at the ends of the curve, changing from the circular arcs with radii E and F to practically straight, converging lines. No provision has been made in the formulas for super-elevation of the outer rail of the curve. In case this condition exists, allowance at the inside of the curve must be made not only for the tilting of the car but also for the compression of the springs on the side toward which the center of gravity of the car body has been moved, this being equivalent to an increase in width of body.

Municipal Ownership for Capital

For the District of Columbia Committee of the House of Representatives Representative Robert Crosser, of Cleveland, has filed the majority report approving the Crosser bill for the government ownership of the street railways in the District of Columbia. The report is a voluminous one, filled with tabulations of statistics and citations from the testimony taken by the committee, as well as from the books of writers on political economy. The minority report, which is being prepared by Representative S. E. Winslow, of Worcester, Mass., has not been finished and an extension of time is to be granted by the House for its filing. Until that report has been made, no action will be taken on the bill. There is little likelihood that the bill will be called up at the present session of Congress.

Representative Crosser's report asserts that government ownership of the street railways would result in better service and better wages and that it would take the companies out of politics. Much of the report is devoted to an attempt to prove that regulation of street railways is not effective, particularly where efforts have been made to divorce regulation from local influence. The report declares that there should be no competition in street car service, and devotes considerable attention to charges of overcapitalization and false accounting. It is asserted the employees of private companies do not receive as fair treatment as municipalities accord them, not because of any ill-feeling on the part of the private employer, but because of the desire to keep down expenses and increase profits, and that one of the most serious evils resulting from the private ownership and operation of public utilities is the corrupting and weakening of municipal governments.

Mr. Crosser devotes several pages of his report to a criticism of the idea of "regulation." Concerning this he says in part:

"Regulation is now constantly urged by the defenders of private ownership as the proper remedy for the evils which have invariably accompanied private ownership of public utilities, and it is somewhat amusing to know that the private owners of public utilities are the most eager and vociferous in the demands for regulation. The terms of the franchise, the traffic regulation, etc., are all efforts at regulation, but practically every objection and defect that has been shown to apply to private ownership and operation of street railways under these old regulative plans applies to the later methods of regulation. The fact is that the change has been largely a change of name. The regulating body is now generally called a public utility commission, whereas it was formerly called a council or board of aldermen. In this connection, however, it is interesting to note one essential change upon which the public utilities are insisting, and that is the transfer of the regulating authority from local to state officials. The state board is much less responsive to the will of the people of the municipality, who are the only ones directly affected."

As a resident of Cleveland, and a follower of the late Mayor Johnson, Representative Crosser complains particularly about the troubles in his own city. He discusses the controversy in Cleveland and states that he cites the case simply to serve as one example of the very natural tendency of a privately owned public utility to resist in every way possible every effort to regulate it in any way which will seriously interfere with its profits, and also to show the tendency of commissions who are not solely responsible to the persons directly affected by their decisions. According to Mr. Crosser, the fundamental cause for the failure of commission regulation is the natural and unavoidable antagonism between the interest of the private owner of public utilities on the one hand and the general public on the other. The private owner's natural tendency is to procure the largest amount of revenue possible for the least service necessary. "On the other hand," says Mr. Crosser, "the municipality is not concerned in earning a profit on its street railway system, but is concerned only in operating the system, so as to furnish the best service possible at the lowest price which will enable it to pay expenses. So far as the public official in charge of a municipally owned public utility succeeds in providing the best service at the lowest price, just so far is he a successful man in the eyes of his employer. According to his success will be his reputation, the certainty of employment, and the increase of his compensation toward the maximum for the kind of work in which he is engaged.

"There would be," the report continues, "no corruption and scandal in connection with efforts to procure special privileges or to resist governmental restrictions, because the municipality requires no special privilege and has no other restrictions than those self-imposed. Experience shows that the rates of fare of a municipally owned street railway are materially less than those of the privately owned systems. There are no big dividends to pay but instead usually a very low rate of interest. There is no over-capitalization, and there are no large promoters' and attorneys' fees to be paid for lobbying.

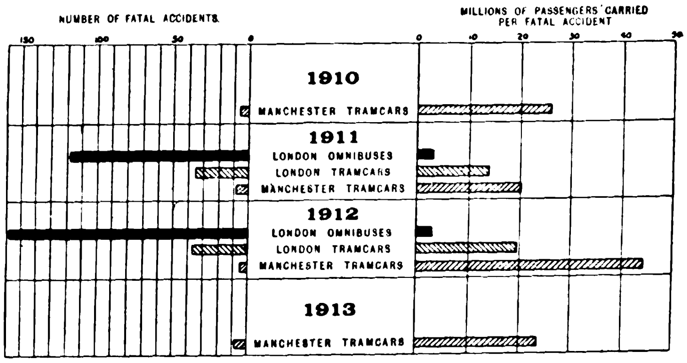
"The chief and really the only argument of any consequence urged against municipal ownership is that machine politicians would control the employees of a municipally operated street railway to perpetuate themselves in power. It must be remembered, however, that the city administration would be held responsible for the conduct of the street railway system. If the service should be inferior as a result of employing incompetent men, the city administration would suffer at the next election. With newspapers free from such influences as private street railways can and do bring to bear upon them they could and would without restraint criticise any attempt by public officials to place political supporters in the street railway service, regardless of competency. The fact is that private ownership fosters the political machine to a far greater degree than public ownership."

Mr. Crosser says that there are two municipally owned street railways in the United States, at Monroe, La., and San Francisco, Cal., and he insists that both have proved successful. The report presents a tabulation of British statistics to show that municipally owned railway lines are more liberal in extensions in non-profitable territory than are privately owned systems and that municipal ownership also results in reduced fares. Figures from the report of the National Civic Federation are used by Mr. Crosser in trying to prove that municipal operation results in a reduction of working hours, increased wages and welfare activities for aged employees. The report concludes with a statement of the financial and physical details of the street railway systems in the District of Columbia.

Forty-five employees of the Pennsylvania Railroad have recently been retired under the pension rules of the company. Two of the men have been in the company's service more than fifty-two years, while twenty have worked for the railroad forty years or longer. One motorman served fifty-three years and three months.

Traffic Study in Manchester, England

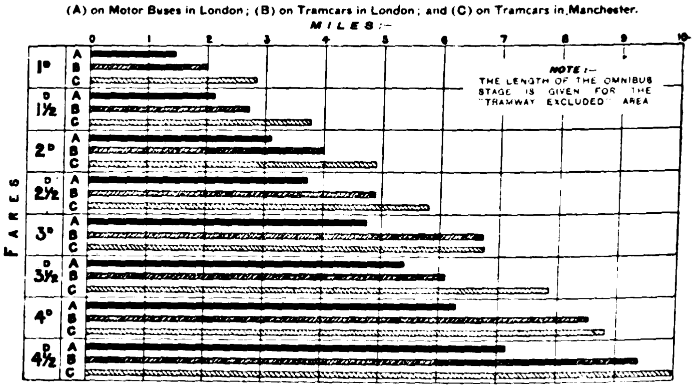
J. M. McElroy, general manager Manchester Corporation Tramways, has recently submitted to the city an extensive report on the congestion problem in that city. This report is based on the study of the local situation as well as of the traffic problems in other cities with data obtained by personal visits by the manager during the past year to New York, Boston, Philadelphia, Chicago, Pittsburgh, Newark, Toronto, Montreal, Paris, Berlin, Vienna and Hamburg. The report is accompanied by maps, diagrams and other particulars of the cities visited. An interesting discussion is given on the practice in each city. Below will be found an abstract of the London bus situation and some of the conclusions reached.



MANCHESTER REPORT—DIAGRAM SHOWING COMPARISON OF FATAL ACCIDENTS TO PASSENGERS CARRIED

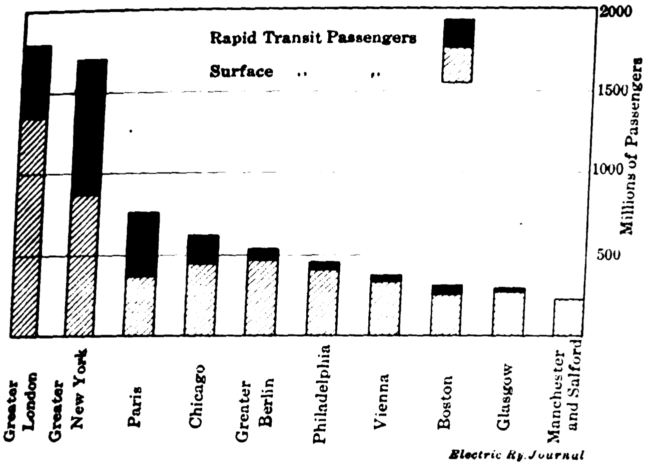
THE LONDON SITUATION

A defect of the London rapid transit system, according to Mr. McElroy, is that it has not been laid out in accordance with a comprehensive plan to meet the requirements of the city as a whole. There have been several recommendations in favor of a permanent authority for controlling all the means of transit in London, but this has never been carried into effect. Recently there has been an amalgamation of tube companies and bus companies so that, with the exception of the tramways operated by the London County Council, the passenger transportation business in London is almost entirely in the hands of one traffic combine. This combination has brought many advantages to the traveling public, but Mr. McElroy suggests that there is danger that the public interests may not be properly safeguarded if there is no control or regulation by some permanent traffic authority.

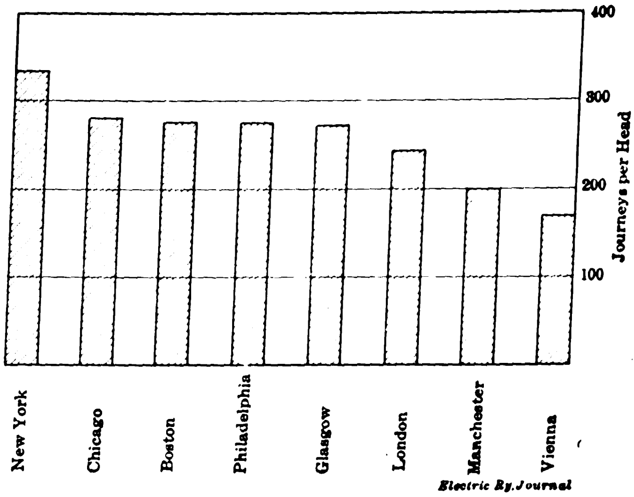


MANCHESTER REPORT—DIAGRAM SHOWING COMPARATIVE DISTANCES WHICH CAN BE TRAVELLED FOR DIFFERENT RATES OF FARES

There is no city in any part of the world so favorably circumstanced for the working of motor buses as London. It has the best paved streets in the world, and



MANCHESTER REPORT—PASSENGERS CARRIED IN DIFFERENT CITIES



MANCHESTER REPORT—RIDES PER HEAD OF POPULATION

the riding habits of the people are increasing rapidly. Moreover, the construction of tramways has not been permitted in the heart of London, therefore the motor buses supply what the tramways cannot, namely, through service. In this part of the city the bus fares are higher, due to lack of competition, and in many cases are about 1 penny per mile.

The running time of the motor buses compare favorably with rapid transit in the tubes. It has been found, however, that the buses are more dangerous on streets than the tram cars. The number of passengers carried per fatal accident by the motor buses of the London General Omnibus Company in 1911 was 2,900,000, and in 1912 the number was 3,100,000, whereas for the tram cars of the London City Tramways the figures were 14,400,000 and 19,800,000. This condition is due largely to the fact that as yet no satisfactory lifeguard has been devised for use on the buses.

CONCLUSIONS

The conclusions in general are that a comprehensive plan for transportation should be made in the case of every large city and should be followed, that where there are rapid transit lines they should be under the same management as the surface lines so as to supplement the service of the surface lines, but that generally the subways should not be used by the surface cars. The reason for this statement is that on account of their great expense of construction, the underground lines must be worked by high-speed trains operating under very close headway. In discussing rolling stock improvements the report says that the points to seek in car design are to improve rapid loading and unloading, to prevent boarding and alighting accidents, to decrease the number of stopping places and to simplify fare collection. Mr. McElroy speaks favorably of the operation of the pay-as-you-enter system in America and thinks that while the obstacles in the way of applying it to a zone system are serious they are not insurmountable.

The bridge department of New York City is arranging to divert to the Manhattan Bridge many of the surface railway cars now operated over the Brooklyn Bridge on account of the necessity for reconstructing the Brooklyn Bridge to fit it to care for the operation of rapid transit lines under the dual subway contracts.

Some "Safety First" Practices in German Substations

The "safety first" movement in the United States is comparatively new, but in Germany and other European countries many schemes for the protection of electrical and other workers have been used for years. The different industries have co-operative accident insurance organizations, and committees from these bodies decide upon and enforce the protective measures to be used.

The accompanying illustrations of some substations equipped by the Siemens-Schuckert Company are typical of the care given to this subject. Thus at the Heilwig Street substation of the Hamburg Rapid Transit System all of the switching equipment for each machine unit is mounted on a carriage in a properly-labeled cabinet. When any repairs or adjustments are required the carriage is drawn out along a set of rails to a place where the work can be performed in perfect safety and under the best space and lighting conditions. In the view showing transformers and reactance coils, heavy screening is employed to prevent contact with the reactances. In a second view it will be observed that the high-tension switching sections behind the switchboard are screened to a height of about 6 ft. These screens are divided into doors which may be opened for the inspection of individual sections. Where separate control apparatus is installed for single operating units, like motor-generator sets, it is common to inclose such equipment in a wire cage to which access is obtainable only by authorized employees. A third view shows that protection against transformer leads is obtainable by the addition of a tray-like side-screened structure at the top. In addition to these forms of protection, enameled warning signs lettered in red on a white surface and also marked with the symbol for a lightning stroke are installed wherever necessary.

It is also common practice in the power plants, substations and machine shops of Germany to inclose all belting to a reasonable height, and to paint the dangerous parts of machinery a vivid red.

Correspondence Courses for Accountants

PUBLIC SERVICE RAILWAY COMPANY
NEWARK, N. J., June 23, 1914.

To the Editors:

The course in accounting prepared by the committee on education of the American Electric Railway Accountants' Association and described in the issue of the ELECTRIC RAILWAY JOURNAL for May 30, page 1214, is the latest effort in correspondence courses by a national association.

The fee of $10 for each year's lectures in the new course is an exceedingly low one.

The usefulness of these correspondence courses, conducted by trained teachers and under the technical advice of those best qualified to give it, has been amply demonstrated. The work is done without any idea of profit and the charge to the student is a nominal one. The information given cannot be obtained elsewhere except at a very much greater cost. The course can only be a success with the co-operation of accounting officers of member companies. The enrollment of employees in such a course is bound to have a stimulating effect upon them and add to their efficiency. The effect upon the student will be to give him something more than an enforced interest in his daily work and should make him a much more valuable employee.

It may be of interest to accounting officers who have had no experience with educational courses of this character to know that courses along similar lines have been given by the National Commercial Gas Association for the past three years. The first course consisted of ten lectures on salesmanship, each with a series of ten questions. A lesson was issued each month. Seven hundred and twenty-five students enrolled and a large percentage completed the course. A similar course on business organization was given the second year. Six hundred and sixty-eight students enrolled and a large percentage completed this course also. The third course is now being given. It consists of ten lectures on the utilization of gas appliances. This course is a most complete one, and 3850 students have enrolled. Each lecture gives the history of a class of appliances, the details of their manufacture, their efficiencies, their application, installation and operation.

The success of these three courses has led the Gas Association to plan for a three-year course. This course is now in preparation and will comprise the following subjects:

First year, business English; penmanship; arithmetic; mensuration; elementary algebra; elementary geometry; elementary physics (mechanics, heat, electricity, light); elementary chemistry.

Second year, manufacture and distribution of gas; generation and distribution of electricity; utilization of gas and electricity (lighting appliances, heating and cooking appliances, power and industrial appliances).

Third year, corporation organization and control; finance, accounting and office management; salesmanship and sales development; inter-department relations; public relations.

The fee for the three-year course will be $60, if payments are spread over the three-year period, or $50 if the fee is paid in advance. It will be necessary to have 1000 men enroll in order to conduct it.

The plan under which the third-year course on utilization of gas appliances has been conducted has provided for a class leader wherever there have been sufficient men in a company taking the course to warrant it. The class leader, through correspondence with the director of the course, prepares himself in advance of the date on which the answers have to be sent in and calls the members of the class together to discuss the lessons and the questions. It has been found that these meetings and the discussions have increased the usefulness of the course tremendously and have caused the men to retain interest in the work. The class leaders are also of very great assistance to the director, and the American Electric Railway Accountants' Association will do well to adopt a similar practice as soon as the enrollments justify them in going ahead with their educational program.

Accounting knowledge is useful to every employee of an electric railway and no doubt the Committee on Education of the American Electric Railway Accountants' Association will find a large proportion of men outside of those in the accounting department enrolled in the course in the same manner as the educational committee of the National Commercial Gas Association found that many men outside of the departments interested were taking the course provided by them.

Both self-interest and the desire to become efficient should bring about a large enrollment in this very practical course on accounting prepared by the committee on education of the American Electric Railway Accountants' Association. P. S. YOUNG, Treasurer.

The Springfield Report on Electrolysis

NEW YORK, June 30, 1914.

To the Editors:

The Springfield electrolysis tests, which were reported in abstract in the ELECTRIC RAILWAY JOURNAL for March 21, page 646, were evidently in mind when you wrote the editorial printed in the issue of June 27, page 1428. I wish to call attention to the fact that the conditions in Springfield were very favorable on account of the co-operation of all of the public utility companies involved. Owing to the expiration of certain franchises the city was able to use pressure in bringing about such co-operation, which could not have been obtained before. This co-operation was absolutely necessary to secure the interlacing of the negative return systems of the local utilities. It would have been impracticable for either company having a power plant inside the city limits to develop a reasonably safe system alone.

The method adopted in Springfield for preventing electrolytic troubles was the negative return system of the type called "the insulated negative feeder system." In this the feeders radiating from the power station to the rails are distributed in accordance with the current congestion and the potential gradients. The accepted practice is to use the same insulating methods as are employed on the positive side of the distribution system. In a few isolated cases scrap rails, bonded together and buried, have been used for the return feeders from rails to negative busbars, but on account of the corrosion of the bonds between the rails this practice has not proved reliable. While insulated return feeders were found practicable and presumably economical in Springfield, it does not follow that this system should be used everywhere, for the Springfield case must be considered a special one.

In order that the best return system may be provided for any particular case, the engineers involved should be familiar with all methods of protection and should investigate them with regard to the peculiarities of the special system under study. I have not found two systems which present identical conditions in regard to the electrolytic relation of sub-surface conductors and the negative return. In more than one hundred systems personally examined since 1896, no one method of relief has proved to be a panacea. In all cases it is not only the prevention of electrolysis which must be considered but also the cost of the recommended plan which must not be overlooked.

Returning to the subject of the insulated return system it should be noted that there are conditions under which the extension of the negative return will not accomplish desirable results. In the first place, when the auxiliary negative feeders are carried far from the power plant, the area of contact between rail and soil is increased and the resistance of contact is decreased. The same current can then be dissipated from pipe surfaces with less difference of potential between pipe and soil. When there is no accidental metallic connection between the rail return and the underground conductor system the return current divides between the rail return and the earth pipe return in inverse proportion to their resistances. Anything which tends to reduce the resistance of the earth path, therefore, deflects more current from the rail return and increases the electrolytic corrosion in the area where the pipe is positive to the soil. It is important to note that the vital difference of potential involved in this matter is that which exists between the pipes and the adjacent electrolyte. The difference of potential between pipe and rail is the sum of the pipe surface drop, the counter emf and the contact resistance drop between rail and earth. In addition there is a further resistance drop due to paving conditions. Now if the resistance between rail and soil is lowered, the difference of potential between the electrolyte and sub-surface conductors is increased, with consequent greater danger of corrosion. Another condition which is produced by the expansion of the negative feeder system is the increase in the difference of potential between rails and adjacent roadbeds in negative territory. This increases the corrosion at the foot of the rail, such corrosion being known as "foot-wear." If this foot-wear is more rapid than the head-wear on the rail the normal useful length of life of the rail is not obtained. Where rails have concrete footings or bases, chemical reactions are set up decrystallizing the bond between the rails and the concrete, producing the condition known as "rotting of the concrete." This is due to the acid condition produced in the concrete at its junction with the rail when current leaks from the rail surface.

In a number of respects the Springfield report seems to me to be incomplete, and possibly misleading. The report does not contain data regarding the increased difference of potential between pipe and surrounding electrolyte due to the increase in leakage areas, as outlined above. Further, the tests were made in winter, during which season the frost in the ground increases the total resistance of the earth circuit. At the same time the resistance of the rail return is much less than in summer on account of the comparatively high temperature co-efficient of steel. The over-all voltages given in the report are not the maximum voltages, as higher voltages are often found than those existing between the end of the road and the power station. This is especially true where there are metallic connections between rails and pipe. In Springfield these metallic connections seem not to have been tested for, although they were found to exist during a previous survey. The report does not state whether or not the resistances of the pressure wires were compensated for in determining the over-all voltages. As these were telephone wires measuring, say, 8 ohms per thousand feet their resistances would exert considerable influence on the results if not corrected. The cost of the losses in the Springfield case are incorrectly estimated, for central stations of the size of those in Springfield would produce additional energy to make up the losses at ½ cent per kw-hr. This overstatement of the cost of energy leads to incorrect conclusions. Operating engineers know that all the cost which can be charged in this case is that of additional coal. The increased efficiency in the outlying feeders is apparent but not real. The reduction of potential gradient caused by these feeders is due to the local increases of potential between the rail and the negative bus at the power station. The increased local losses should be deducted from the apparent economy affected by the outlying negative feeders. I cannot see, by any argument of logic or mathematics, how the aggregate drop between rail and negative bus can be increased and yet at the same time the losses in the negative transmission system be decreased. Furthermore, I do not believe negative boosters to be an economical proposition as compared with proper feeders, from the standpoint of operation, depreciation and attendance. Boosters have been installed in several cases in this country but they have been abandoned. The system installed in Springfield may be perfect, but the data in the report do not warrant us in judging it to be so.

Let us consider briefly the objections which are alleged against the pipe drainage system. In these objections the usual statement of the proportion of current returning over the drainage feeders indicates metallic connections between rails and pipe. In any case where 10 per cent or more of the total station current returns over the pipe feeders there is undoubtedly metallic connection between the rails and underground conduction structures which have been temporarily connected to the negative bus. The amount of this current flow in the pipe system, not metallically connected to the rails, can always be brought down to from 5 to 7 per cent of the station output by properly adjusting the pipe drainage feeders with due regard to the potential gradient in the rail and the congestion of current around the power station.

It is often argued from theoretical considerations that insulating joints in pipe lines, whether they be ordinary joints insulated by caulking or special joints of the insulated type, will cause corrosion on the positive side of the joint. As a practical matter I have never found a case of corrosion on the positive side of a pipe adjacent to an insulating joint. This matter is continually raised in electrolysis suits, and railway companies have continually asked for samples of corroded pipe adjacent to insulated joints. Such exhibits have never been made for the reason that the theoretical corrosion is that due to the assumed electrical conditions surrounding the joint, but, as a fact, the current flow there is actually negligible in amount. In a test made on an 8-in. cast-iron main buried in earth saturated with moisture, measurements made 4 ft. on either side of an insulating joint showed a resistance of 30 ohms when a 5-volt pressure was first applied. This rose to 180 ohms in sixty hours. The effect of introducing an insulating joint in the line of pipe paralleling an electric railway line is to force the current into a path in shunt with the joint. This is not true in a pipe-drainage system composed of a quadrilateral system of conductors covering an area over which the lines of rail radiate. In this case the current has presented to it many paths of metallic return, and main arteries of circulation of current are often found in pipes not adjacent to the railway line.

I would not advocate a pipe-drainage system as the only means for pipe protection, but the objections raised against its adoption in the Springfield report are more academic and theoretical than practical. No conscientious engineer would attempt to utilize the pipe-drainage system without first connecting the pipes and cable sheaths to the negative busbars, and then testing the system to determine the exact conditions of the piping as a conductor. He would then relieve those sections where the potential gradient is too high or differs too much from that of paralleling rails or where shunting from one system to another occurs. In a pipe-drainage system of negative underground conductors, all pipes and cable sheaths must be treated as one negative system of return, and so connected that the potential relations of sub-surface conductors in any one locality will be practically the same. The pipe-drainage plan must not be applied to any system which has metallic connections between pipes and the rails at any point, and it is, furthermore, illegal to apply such a system where such metallic connections exist under the general law that one cannot use another's property for his own purposes. Metallic contacts must first be located by well-known means. They are often found in iron bridges, gate boxes, surface connections and forgotten connections which existed originally between rail and pipe. These must all be removed and the resistance of the earth interposed between the pipe system and the rail.

In regard to the expense of the pipe-drainage system, it should be noted that the return current to be dealt with is from 5 to 7 per cent of the total current output of the station only. Hence the cost of conductor through the territory over which pipe and cable sheaths are drained is greatly less than that of any insulated negative return system which increases the negative return drop and has to handle the total output of the station. Furthermore, by the proper location of the drainage feeders a compounding effect can be produced by the natural shifting of the load over the system by which portions of the pipe are made negative for a short period, and an advantageous hydrating effect be produced which tends to neutralize the positive ionic condition existing between pipe surface and electrolyte.

In conclusion, I wish to call attention to the fact that engineering for betterment is the useful spending of a dollar to earn its value by producing greater economy. Academic methods which do not comprehend this phase of engineering are costly and experimental. The electric railways in Ohio have been restricted in their earning powers by legislation under threats regarding franchises. Pressure is now brought to bear on them to safeguard the property of other utility companies which claim damage from electrolysis. The railway companies are further burdened by methods which have for their purpose the development of a system to conform to those arbitrary rules known as the British Board of Trade provisions. These provisions may or may not prove effective, serious electrolytic damage having arisen when property has been maintained under them. What ought to be accomplished is the protection of the pipe surfaces against accentuated corrosion due to current flow from them; to keep these surfaces at potentials below those at which ionization is set up in the electrolyte which surrounds them. The eliminating voltage in any natural ground-water electrolyte is readily determined and the reduction of the potential difference between pipe and electrolyte is a matter of feeder resistance.

On the above two fundamental principles rest the solution of the problem of providing effective preventive measures. Without the application of these principles in every given locality under treatment the results that are attained are only visionary.

ALBERT B. HERRICK, Consulting Engineer.

Accounting Terms

MOBILE, ALA., June 23, 1914.

To the Editors:

Your editorial of June 20, 1914, "What is Treasury Stock?" is very timely.

It has been realized for a long time by electric railway accountants and others interested that terms are used in accounting, whose meaning is not clear, and in some cases names are used interchangeably, while their meaning is different.

A celebrated authority on accounting makes this statement:—"Unfortunately, despite the advancement made in accounting, there is a most embarrassing confusion in terminology, so that one can never be sure of just what is meant by a given account."

Realizing this trouble, the executive committee of the American Electric Railway Accountants' Association appointed a committee on accounting definitions, and it is hoped that through a report of this committee a number of conflicting terms may be clearly defined, and the adoption by the association of the defintions will do much towards clearing up confusion of terms now existing.

A recent newspaper article discussing a reorganization plan stated that provision may also be made for an issue of "adjustment income bonds." This term is capable of several interpretations, the correct meaning not being clear without additional explanation.

This is a subject of vital importance to the owners of bonds and stocks, as well as to operating officials of corporations, and it is hoped that the Accountants' Association will be able to do its part in defining terms in accounting which are not clearly understood by all who use them.

M. W. GLOVER.

Princeton Meeting of the Society for the Promotion of Engineering Education

The twenty-second annual meeting of the Society for the Promotion of Engineering Education was held at Princeton, N. J., from June 23 to 26. The proceedings cover a wide range of subjects but the central idea brought out was that emphasis should be laid upon fundamental principles, and that education is not so much a matter of administration as of purpose and spirit. The meeting was notable from the attendance of official representatives of a large number of educational institutions.

The following elections were made at the last session: President, Anson Marston, dean of the division of engineering, Iowa State College, Ames, Iowa; vice-presidents, Henry H. Norris, ELECTRIC RAILWAY JOURNAL, New York, and C. Russ Richards, acting dean of the College of Engineering, University of Illinois, Urbana, Ill.; secretary, F. L. Bishop, dean of the School of Engineering, University of Pittsburgh, Pittsburgh, Pa.; treasurer, William O. Wiley, secretary John Wiley & Sons, New York; members of the council, R. H. Fernald, professor of dynamical engineering, University of Pennsylvania, Philadelphia, Pa.; A. H. Fuller, dean of the College of Engineering, University of Washington, Seattle, Wash.; A. M. Greene, Jr., professor of mechanical engineering, Renssalær Polytechnic Institute, Troy, N. Y.; E. V. Huntington, assistant professor of mathematics, Harvard University, Cambridge, Mass.; Vladimir Karapetoff, professor of electrical engineering, Cornell University, Ithaca, N. Y.; D. C. Miller, professor of physics, Case School of Applied Science, Cleveland, Ohio, and W. M. Riggs, president of the Clemson Agriculture and Mechanical College of South Carolina, Clemson College, S. C.

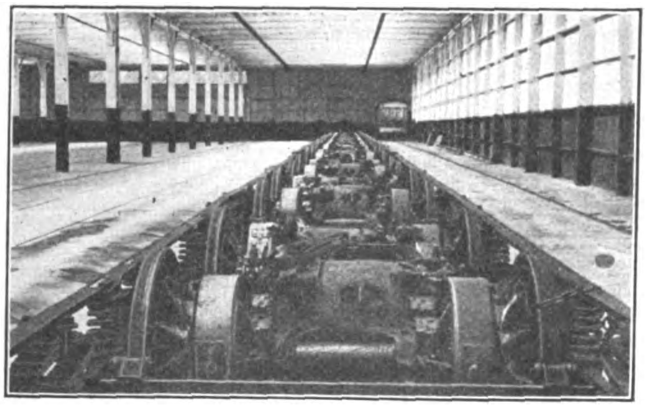
Double-Pinion Drives for Railway Motors

BY A. A. BLACKBURN, CHIEF ENGINEER, BELFAST (IRELAND) CITY TRAMWAYS

In the *Tramway & Railway World* for April 7, 1910, I contributed an article regarding the use of double-geared drives on the Belfast City Tramways. Since that time we have equipped approximately 150 car trucks with this drive, and they have proved to be uniformly successful.



IRISH GEARS—TRUCKS EQUIPPED WITH DOUBLE GEARS AND PINIONS READY FOR INSTALLATION UNDER CARS

Our experience with this double drive during the past four years has enabled us to make a fair comparison between the single and the double geared method of driving, and the results obtained have been so satisfactory that we are now equipping all of our 300 trucks with the double drive as rapidly as possible. We have had no reason to alter our views in regard to the claims set forth in the above mentioned article, but as a matter of fact we are finding even greater improvements in the wearing parts on all the trucks fitted with this drive, as against those of the single gear.

Cars have been sent in to the works, on an average, about every nine months for wheel flange wear, but we find that the cars fitted with the double gears stay in service for an average period of eleven months before being sent into the works. We attribute this to the fact that the four gears drive the truck parallel on the track. These cars also climb hills better, as the wheels have not the same tendency to slip. The trucks do not have the same corner-thrust action, consequently they keep more square and the wheels wear more evenly.

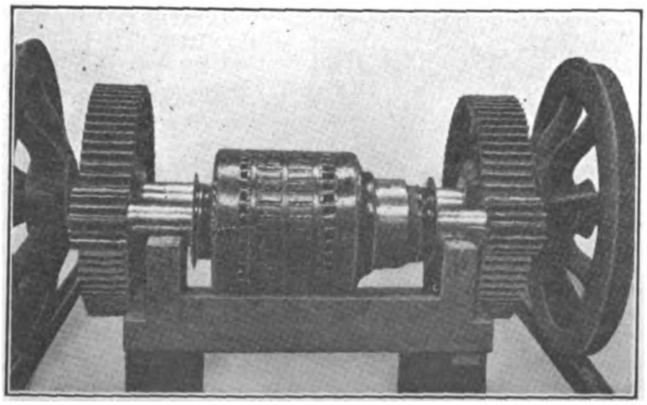
Motormen report that the double-geared cars run much steadier and start easier. In starting the car there is not the same jerk as with single geared trucks, therefore there is not the same wear on gears and pinions. These cars have run on every service and over every route on the system, and careful meter tests show that the current consumption per car mile is slightly less. Armatures and motor-suspension bearings wear more evenly and last longer. Commutators do not flash across and they wear better.

In fitting the double gear-wheels to an axle, a certain amount of care is necessary to see that the gear-wheel teeth are parallel and are perfectly in line, one with the other. To obtain these results everything depends upon the accuracy with which the gear-wheel keyseats are cut as the least alteration in the keyseat or key throws the gears out of mesh. The armature shaft is lengthened out at the commutator end to suit the extra pinion, and the same care must be observed here as with the gears, that is to say, the keyways in the pinions must be cut exactly parallel one with the other.

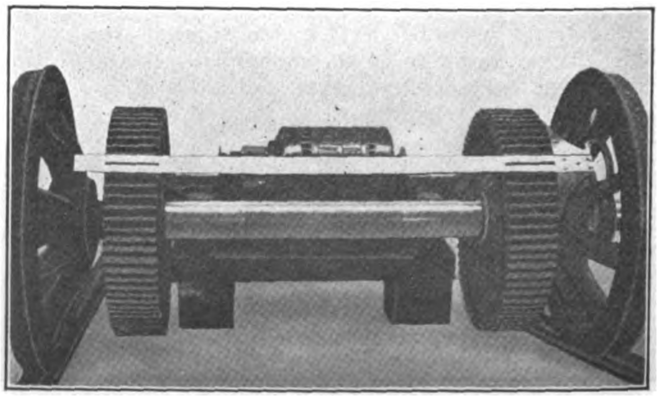
We use the British Westinghouse Company's 68-tooth gears and 14-tooth pinions. They are supplied to us with keyseats accurately machined out for this purpose, but slight errors will sometimes arise. Therefore all our gear wheels are tested before fitting, by placing two gear wheels together on an axle fitted with a long key. By this means we are able to see if the gear-wheel teeth and keyseats correspond.

Pinions are tested by a similar means. A short piece of axle is turned with a taper at each end, and fitted with two keys. Two pinions are then pushed together until they meet. We are then able to see at a glance whether the teeth are in line.

Occasionally a gear key will have to be side-stepped to permit moving the gear wheel around until the gear teeth are in line, and when this has to be done we proceed as follows: First of all one gear is fitted firmly



IRISH GEARS—ARMATURE WITH ITS DOUBLE PINIONS IN MESH WITH GEARS



IRISH GEARS—T-SQUARE USED TO ALIGN TEETH OF DOUBLE GEARS into position, then the second gear is placed over its keyseat, from which the key has been removed, and then the gear is carefully adjusted by means of a steel T-square, into the blade of which are cut slots which fit over one tooth in each of the two gears. The amount of side-step or off-set required by the key can be seen at once from the relative position of the keyways in the shaft and in the gear.

Overhead Problems—Poles and Adjuncts

BY CHARLES RUFUS HARTE, CONSTRUCTION ENGINEER CONNECTICUT COMPANY

The fact that much overhead construction might well be common for trolley, telephone, telegraph and lighting has led to a movement for a joint committee representative of all interests to deal with such questions, and although apparently no definite steps as yet have been taken to that end, it is undoubtedly a move of the near future.

As regards wooden poles, however, no action is needed; although differing somewhat in wording the important requirements of all concerned are identical. The following table shows standard dimensions of the principal woods used.

MINIMUM POLE DIMENSIONS

Natural Poles

Length of Pole, Feet	CHESTNUT Circumferences in Inches at Top and "Ground" Class A		Class B		Crook, Inches	WHITE CEDAR Eastern Circumferences in Inches at Top and "Ground" Class A		Class B		Crook, Ins. "Ground" circumference to be taken 6 ft. from butt.

In tubular steel poles there is no such uniformity; the makers list a large series of "standard" types and a still larger series of "specials." The table in the 1913 report of the power distribution committee of the American Electric Railway Engineering Association gives ninety-six combinations between the lengths of 28 ft. and 35 ft. There is little reason, however, for any such conditions. As listed the poles have lengths varying by single feet, and pull resistances varying by but a few pounds. Lengths varying by 2½ ft. and three values of pull resistance in each size would be more than ample to meet all conditions economically, and would require just twelve combinations as against the present ninety-six.

For transmission work and the like there have been developed some excellent structural forms of pole, but for ordinary trolley work their use has not proved economical. The concrete pole is still in the developmental stage. There are many installations of excellent appearance and behavior, but the fact that they are not being reproduced in most cases raises some question as to their real economy. The suggested A. E. R. E. A. design promises much and it is to be hoped it will receive a thorough test in the near future; there is a large field for a reasonably low cost concrete pole that can be handled by the average pole gang and be depended upon.

SETTING POLES

Pole setting follows the practice of the earlier users, the depths under normal conditions being as follows:

Length of Pole:	DEPTH OF HOLE In Rock or Concrete	In Earth
30 ft.	5 ft. 0 in.	6 ft. 0 in.
35 ft.	5 ft. 6 in.	6 ft. 0 in.
40 ft.	5 ft. 6 in.	6 ft. 6 in.
45 ft.	6 ft. 0 in.	6 ft. 6 in.
50 ft.	6 ft. 6 in.	7 ft. 0 in.
55 ft.	6 ft. 6 in.	7 ft. 6 in.
60 ft.	7 ft. 0 in.	8 ft. 0 in.
65 ft.	7 ft. 0 in.	8 ft. 6 in.
70 ft.	7 ft. 0 in.	9 ft. 0 in.

On side slopes the measurements should be made from the low side, and in soft or treacherous ground greater depths may be necessary. Ordinarily the roadbed furnishes good setting, but occasionally it is necessary to bolt carrier frames to the pole at the ground line. In dry sand or running wet soil the excavation is often best made inside a barrel or casing which is driven down as the hole deepens, and in which the pole is eventually set. Such casing, and for that matter all holes, should be large enough to permit thorough tamping without the necessity of cutting the butt.

The butt always should be cut square, and in poor soil those poles should be used which have the greatest butt area. Some years ago a line foreman on work under the writer's charge made the brilliant discovery that by pointing the butts he could stand poles on end in a swamp section and work them down to position without digging any holes at all. His remarkable record in pole setting across the meadow was not understood until later, when the crossarms had stopped further settlement and the poles were extracted. In this particular instance squaring the butts and filling in the new holes with a bed of gravel about 2 ft. deep was sufficient to prevent further trouble.

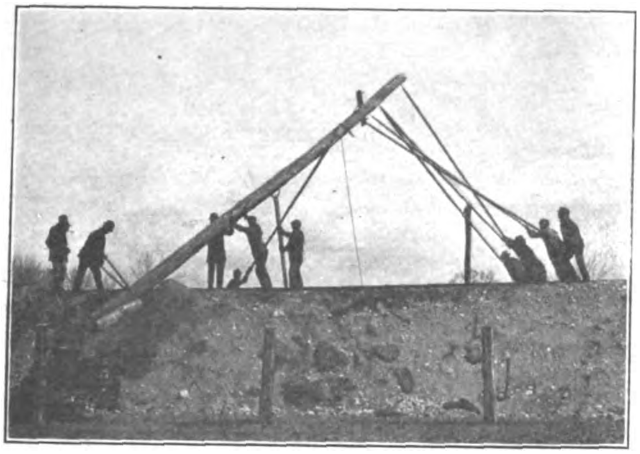
Barrel holes, holes in soil not requiring barrelling but of poor holding capacity, or where the pole is subject to heavy stresses, and holes for steel poles, are often filled with 1:3:5 concrete. If practicable, this concrete should extend 6 in. above the ground with a diameter 8 in. greater than that of the pole at that point, and should then pitch up to the pole at an angle of 45 deg., this to prevent the otherwise probable decay or corrosion just above the concrete. In city work, however, it is rarely possible to bring the concrete above the surface.

Most wood poles are still hand set, being laid on the ground with the butt at the hole and then up-ended, first by hand, a jenny or pole prop "following up," then as soon as the end is high enough, the pole pike-poled till upright. A plank is usually set up in the hole for the butt to thrust against, to prevent caving in the side. A skilful crew will keep the pole steadily moving from the start, making the shifts from hands to pikes and through the several lengths of pikes without a hitch. The advantage of mechanical help is fast being recognized, however, and there is now on the market, besides many home-made ones, at least one patented derrick. These derricks expedite greatly the direct handling of the poles, obviating the aggravating delays which often result from caving in the side of the hole during erection and simplifying the manipulation of the pole where it has to go up through a network of existing wires.

Particularly where there are bending strains it is well to wedge the pole with large pieces of rock, and if these strains are heavy key blocks should also be used. One block should be applied at the bottom of the hole opposite the pull and the other at the surface on the same side as the pull. "Four by eight" scantling serves well for this purpose, the bottom key being made 2 ft. long and the surface key 4 ft. long.

RAKING AND ANCHORAGE

Poles should be given a rake away from the track of 6 in. in 24 ft. for bracket poles and 12 in. in 24 ft. for span poles if of wood, and half of these values if of steel. This rake chiefly is for appearance; a pole originally set plumb and having very little deflection looks as if it was tumbling on to the tracks, while with a rake at the bottom, even though the top be deflected in much more than the rake, the pole has an appearance of vigorous resistance and strength that is reassuring to "Pro Bono Publico," "Safety" and other well-known guardians of the general public.



SETTING POLES BY HAND WITH TEN MEN

In city work anchors are usually out of the question, and stability must be secured either through heavy poles with special foundations or by high guys attached to one or more poles at sufficient height above the ground to ensure clearance. In the open, a most substantial anchorage can be had in the direction of the line, if clearance is not essential, by guying to the bases of the adjacent poles. It is preferable, however, to make the attachment at least 7 ft. above the ground, and usually this can safely be done. Where pole attachments are not practicable some form of anchor must be used. The old standby "deadman" consists of a galvanized rod 6 ft. long and 1 in. diameter, with 4-in. x 4-in. x ¼-in. square plate washer and nut at one end, and eye at other. Run through a half-tie buried 4 ft. under ground, the rod having the same inclination as the anchor guy it is to hold (this should be 45 deg. if practicable); this makes about the best all-around anchor to be had. In good soil the patent anchors which require little or no digging are excellent, but in rocky soils the interferences usually more than offset the advantages.

In rock that can stand the action a wedge bolt is good; for softer rock an eyebolt 2 ft. long should be leaded, sulphured or cemented in a hole as deep as the bolt shank length. Whichever kind of rock anchor is used, it should be set at right angles to the pull of the guy, which latter should make an angle of 45 deg. with the horizontal if practicable. Up to an angle of 75 deg. the customary two-turn wrap will usually hold on the pole without slipping. Where local conditions force a more nearly vertical guy, however, guy hooks should be used on either side, although a guy requiring hooks, as a matter of fact, is of very little service.

Where there is any likelihood that persons will pass at points where guys are low, the latter should be made conspicuous by a marker about 3 in. diameter, painted white. Plank 1-in. thick is sometimes used, but it tends to get edgeways to the traffic, and the line of contact with the guy is a fruitful source of corrosion. The best device is a piece of pipe or tube slipped over the guy and resting on the head of the anchor rod or on a clamp, keeping it about 1 ft. from the ground. Where it is undesirable to undo an existing guy two pieces of half-round molding can well be used, in which case the faces in contact and the groove in which the strand lies should be white leaded. In this, as in all other work, care should be taken that adjacent guards are of the same length and in line. Nothing looks more slovenly than a line of guys, spans, or any other construction which should be parallel but are not, and in which the various fittings are out of line.

INSULATION

Recognition of the danger of unexpected slight shocks which may cause a lineman to fall from sheer surprise is developing a general tendency to double insulate all steel pole work from the trolley, the hanger forming the first break, and on span work a strain insulator 5 ft. from the pole making the second. With brackets the limited space introduces complications not yet worked out with entire satisfaction. About the best treatment so far is by the use of a strain insulator in the oversupport rod and a fiber bushing in the pole seat casting. The use of insulators in the strand requires an extra long bracket arm, as there should be at least 8 in. of free strand between the hanger and the insulator, or between the insulator and the end casting if the former is attached directly to the hanger.

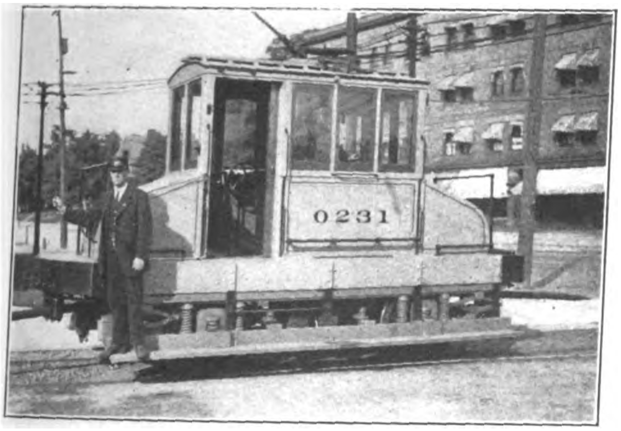
SETTING POLES WITH TRACK DERRICK—FIVE MEN AND TWO ONLOOKERS

Where globe or similar composition strains are used the arm length can be reduced, but the growing use of the wood strain makes the latter the important factor. Recently there have been loud cries for interlocked strain insulators, but it is to the writer's mind an open question to what extent this is warranted. The use of poor stock and poorer treatment by irresponsible makers gave the early wood strains a bad reputation, but as at present supplied by the better class of manufacturers they are entirely reliable. Composition strains hold if the composition squeezes out, but many of their failures are in the malleable castings themselves, dropping the lines, while a slight injury to the composition destroys the insulation. "Goose eggs" of porcelain and tough glass, not to mention the Hewlett and "saddle" types of disk insulators, give an absolute interlock, but many engineers consider it unwise to use such materials where they will be subject to sudden shock.

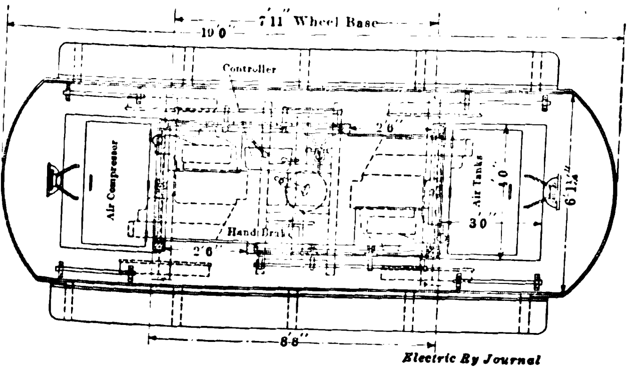
Cleveland Railway's Switching Locomotive

BY TERRANCE SCULLIN, MASTER MECHANIC THE CLEVELAND RAILWAY COMPANY

The operation of trail cars in trains during the rush hours in Cleveland, Ohio, has grown to a point where the Cleveland Railway has found it necessary to provide special switching locomotives at three principal carhouses. These are used to make up trains in the yard as well as to relieve the motors of the trail cars at the close of the rush hours. In general these locomotives are built with a cab, 4 ft. x 8 ft. 8 in. in plan, mounted on an old-style single truck with a 7-ft. 11-in. wheelbase and equipped with two Westinghouse 49 motors. The cab is arranged for double-end operation, being provided with a controller set in the middle of one side to permit the motorman to face either end without difficulty. The air compressor and reservoirs are housed under sheet metal hoods at each end of the cab on the car floor which is 19 ft. long x 6 ft. wide. The floor is of wooden construction mounted on five sections of 5-in. 80-lb. rail, which serve both as longitudinal sills and ballast. Completely equipped this locomotive weighs approximately 20,500 lb., and the two 35-hp motors are so geared that the locomotive will handle two standard Cleveland trailers up a 4 per cent grade, or push seven standard trailers on a level track.



THE CLEVELAND RAILWAY'S SWITCHING LOCOMOTIVE



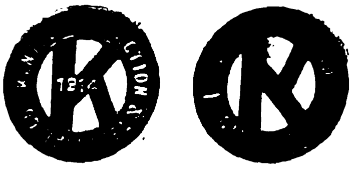
Electric Ry Journal

PLAN SHOWING EQUIPMENT ON CLEVELAND LOCOMOTIVE

The floor plan and arrangement of the control equipment are shown in one of the accompanying illustrations along with a side view of the locomotive. It will also be noted that the locomotive is equipped with side running boards and a continuous arrangement of grab handles which completely surround the cab so that a switchman may board from any position. Instead of standard drawbars these locomotives are equipped with the Cleveland Railway's standard couplers, described in connection with its new center-entrance motor cars in the issue of ELECTRIC RAILWAY JOURNAL for Feb. 28, on page 458. As this coupler is approximately 6 ft. in length it allows for considerable variation in coupler heights and permits the locomotive to push or pull the trailers around the sharpest yard curves.

Metal Tokens for Tickets at Lexington, Ky.

Late in March of the current year the Kentucky Traction & Terminal Company, Lexington, Ky., began the sale of six metal disks for 25 cents in place of paper tickets. The disks are wrapped at the office of the company in envelopes bearing the name of the company and the fac-simile signature of F. W. Bacon, vice-president. The object of selling the disks in this way is twofold: First, to take the sale of tickets out of the hands of the conductors, and, second, to prevent the disks from being rewrapped by the conductors or the public.



OBVERSE AND REVERSE OF METAL TOKENS

The form of accounting on the cars is as follows: Fares are collected according to the prepayment system with the aid of Johnson fare boxes with locked drawers, which are removed at night by the carhouse clerk. The total traffic is registered on the inside register. Change is made by the conductors in wrapped envelopes, which are furnished to the conductors in the same way as the disks. Thus the conductors are not allowed to make change for anything under 50 cents or to sell the disks loose. The disks when dropped in the fare box make the same registration as a 5-cent piece and are thus accounted for on the fare-box dial as full fare. An allocation of straight 5-cent fares and disk fares is made by the auditing department. The tokens, as reproduced, consist of a disk of the exact size and thickness of a nickel, the disk being perforated, however, to form the letter "K" (Kentucky). The head of the disk is marked "Good for 5-Cent Ride—City Car." The tail is marked "Kentucky Traction & Terminal Company" along the periphery, and "1914" on the middle of the "K." The envelopes are of a special red paper. To date, this method of fare collection has proved very satisfactory both to the public and to the company.

At a recent election in Bristol, England, the question of municipal ownership of tramways was submitted to the voters. There were 18,057 votes in favor of municipal ownership and 14,894 against.

Switchgear Ordered for the London & North-Western Railway's Electrification

The British Westinghouse Electric & Manufacturing Company, Ltd., has secured the contract for the high-tension and low-tension switchgear and details for eleven substations, in connection with the London & North-Western Railway's North London electrification. The switchboard panels on order at the present time total 258, comprising 129 high-tension panels and cubicles, 107 d.c. substation panels and twenty-two low-tension a.c. and d.c. boards in the main station. The substations are situated at Camden, Queen's Park, Stonebridge Park, Kenton, Pinney, Bushey, Dalston, Broad Street, Willesden, West End Lane and Acton. There are three rotary converters in each substation, excepting at Broad Street and Acton, in which there are two; of these rotaries six, situated in Camden and Bushey substations, are of 1000-kw capacity, and the rest of the rotaries have each a capacity of 750 kw. The number of high-tension feeders coming into the substations total thirty, and there are also eighteen high-tension outgoing feeders.

The oil-break circuit-breakers are of remote mechanically operated type, except at Stonebridge Park substation where the switches will be of the solenoid electrically operated type. The switches are so arranged that phase separation can be carried out throughout the whole of the switchboard structure, each separate phase of the switch being contained in a separate tank, and in a molded stone cubicle entirely separated from the other phases.

The busbars are sectionalized in each substation, and each machine can be connected through isolating switches to either of two main busbar sections. Isolating switches are being provided on each side of the main oil switches. All incoming feeders will be fitted with reverse-current relays for tripping the oil circuit-breakers, and all outgoing feeders and transformer circuits will have overload relays with time-limit attachments. The rotary converter high-tension circuits will also have overload time-limit relays.

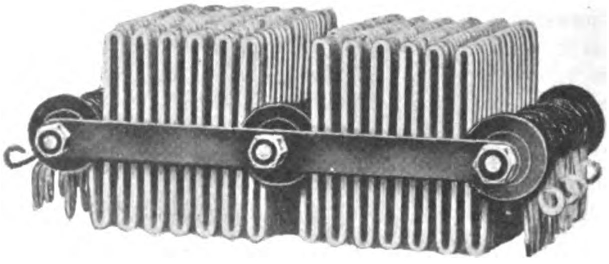
Each section of busbar will be fitted with horn-type static dischargers combined with the usual resistances and isolating switches. The panels on which are mounted the instruments and handles for operating the oil circuit-breaker are situated on the floor level, and behind them are the cubicles containing the oil switches. These are linked to the operating handles, which are mounted on the switchboard by means of levers and rods. In the case of the Stonebridge Park substation, the operating panels will also be on the floor level and the switches will be electrically operated.

The cellwork consists of molded stone. The slate panels of which the high-tension control board and also the low-tension switchboards are made will have a black marine finish. The low-tension panels, exclusive of battery and booster panels, which form the subject of another contract, deal with 100 outgoing feeders and thirty-one rotary converters on the d.c. side. The rotary converter circuits have reverse-current, single-pole circuit-breakers, fitted with a tripping arrangement for operation by speed limiting devices on the rotaries. The track-feeder panels which control both poles of one feeder have single-pole overload circuit-breakers for 2000 amp and two single-pole knife switches for the same current. Sector pattern moving coil ammeters with illuminated dials are used. The circuit-breakers are of type "C" traction pattern.

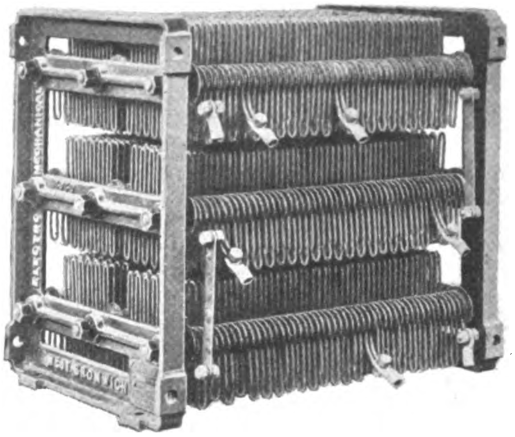
In addition to the above panels there are lighting and auxiliary panels in all the substations, and in the power station a low-tension a.c. and low-tension d.c. board are also to be supplied under this contract to deal with the circuits feeding the auxiliary machinery, lighting, etc. The contract is estimated to be worth between $250,000 and $300,000.

Unbreakable and Jointless Grid Resistors

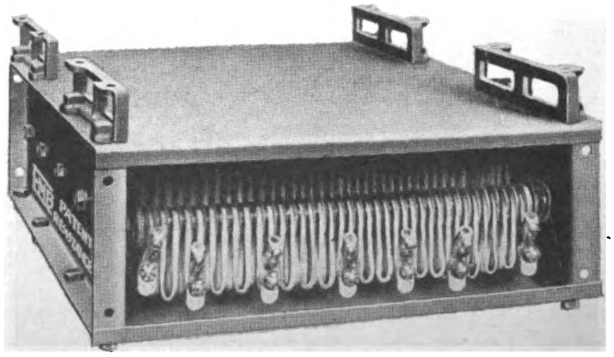
A new jointless and unbreakable grid resistor, known as the "E M B," is meeting with favor on the electric railways of England and other countries. These resistors are supplied by the Electro-Mechanical Brake Company, Ltd., West Bromwich, England, which has already made about 3000 installations. One object of the new grids is to eliminate fragility. A second object is to avoid the troubles due to failure to maintain good contact at the ends of the grids because of corrosion and loss of pressure on the contact surfaces. The latter trouble is frequent with the ordinary grid owing to vibration and to the inevitable expansion and contraction in service. As a large number of the grids are made from one length of material, the circuit does not depend on a contact joint from grid to grid and consequently there is no risk from open circuits or intermittent contacts. The manufacturers point out that although grids of an unbreakable type can be produced



SECTION OF SINGLE GRID



RESISTANCE FOR ATTACHING INSIDE WOOD LOCKER ON CAR PLATFORM



UNDER PLATFORM TYPE RESISTANCE

by stamping, individual grids necessarily must have end contacts so that in this respect stampings have the same defect as castings. Apart from the advantage of no end contacts the new grid is much more rigid than stampings. The temperature coefficient of this rustless material is similar to that of cast iron. It is said to retain its shape even at bright red heat, to have excellent radiating properties and to be free from scale. Its uniform cross section avoids local fusing, and for a given current capacity it occupies practically the same space as cast grids. These resistors can be supplied in any number of units per equipment in a wide range of sizes, either for under-car or platform accommodation, as may be preferred. They are also made for use with other electrical apparatus, notably with crane motors where perfect circuits are so important.

European Chain Insulators

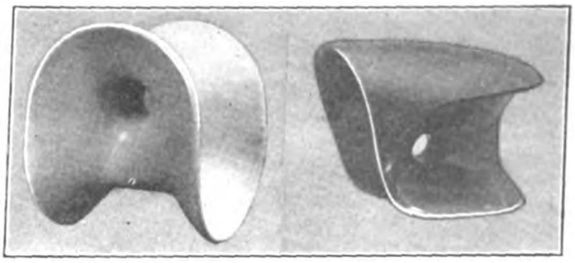
The chain insulators of Vedovelli, Priestley & Company, Paris, France, have found such wide use abroad in both low and high-tension railway work that American engineers may be interested in a brief description of their properties and uses. These insulators are made up in six sizes, *A*, *B*, *C*, *D*, *E* and *F*. Their chief characteristics are shown in the accompanying table:

	Approximate Breakdown Voltage Dry—Volts	Breaking Strain—Pounds
A	15,000	2,204
B	22,000	3,306
C	30,000	4,408
D	40,000	6,612
E	55,000	11,020
F	70,000	15,428

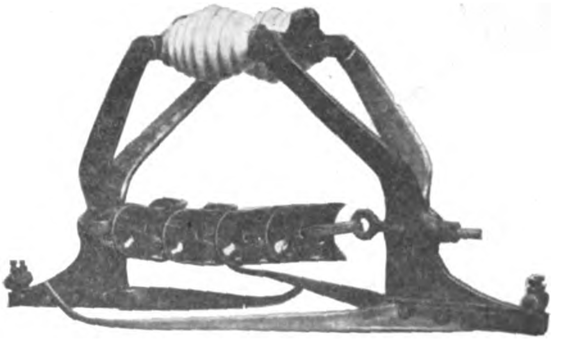
The insulators are made in porcelain or glass, and can be glazed in various colors such as green, brown and white. Type *C* is that most commonly used in high-tension railway work.

The great advantage of this type of insulator is that the thickness throughout is the same at all points of the elements, and thus no internal stresses are produced during baking. The insulators are linked together by galvanized steel wires forming a chain, and the porcelain is always in compression. A chain can be made up for any pressures and loads, and it is necessary only to increase the number of links in series to insure that the chain will withstand a higher pressure. These chains can be placed in parallel for very great mechanical loads, although the largest size will withstand about 15,400 lb., which is sufficient for loads as met with in practice.

A number of views are presented of the insulator alone and of several of its applications to railway work. The first view shows the company's ordinary design at the left and the new hooded type at the right. The latter is superior to the older design in so far as the metal ligaments are protected from rain when the insulator is placed in a horizontal position, thus maintaining a high insulating value even in stormy weather.

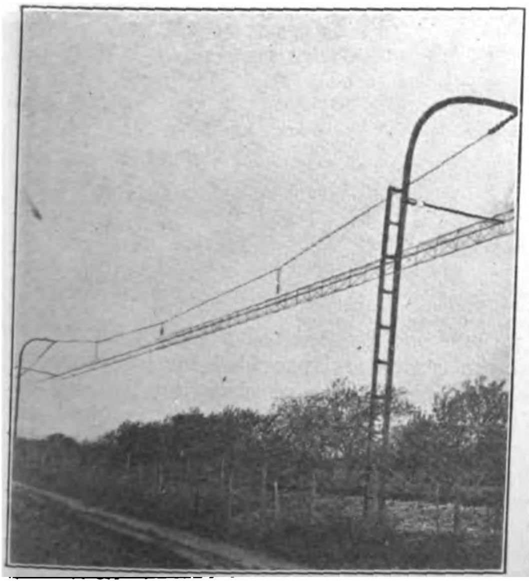


ORDINARY LINK INSULATOR AND HOODED LINK INSULATOR FOR HORIZONTAL INSTALLATION

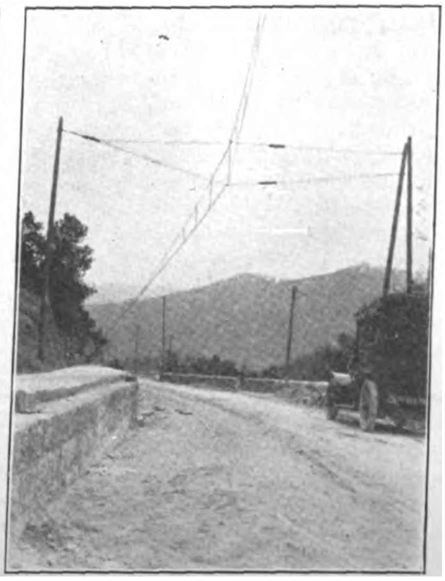


SECTION INSULATOR WITH LINK INSULATOR

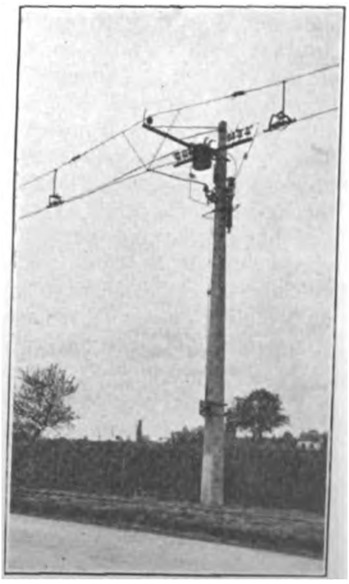
For insulators installed vertically, a metal hood is provided to keep off the rain. The adaptability of this insulator to railway work is clearly indicated by the diverse applications shown. The simplest, perhaps, is that for span construction on the 10,000-volt, single-



SEMI-RIGID TYPE 12,500-VOLT SINGLE-PHASE SUSPENSION ON THE MIDI RAILWAY IN SOUTHERN FRANCE

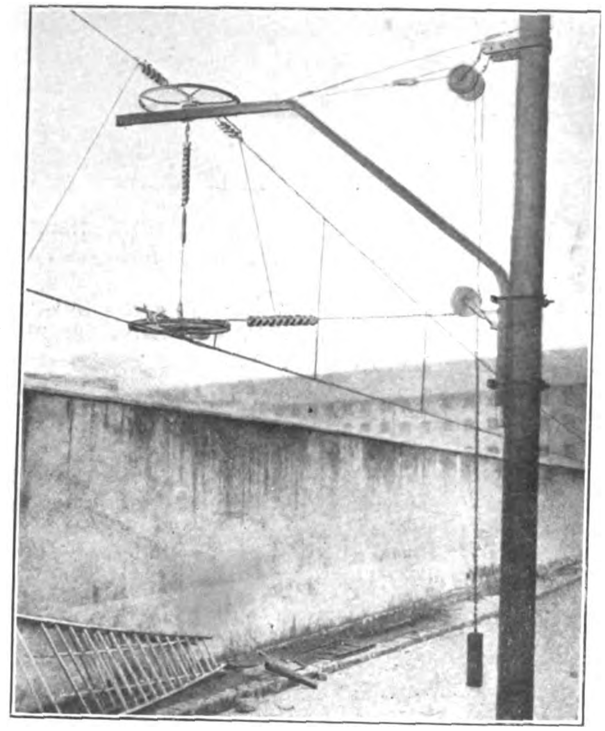


10,000-VOLT SINGLE-PHASE CATENARY SPAN CONSTRUCTION OVER A PUBLIC HIGHWAY



SECTIONALIZING POLE WITH LIGHTNING ARRESTERS AND OUTDOOR TYPE OIL SWITCH phase Oriental Pyrenees Railway. In this instance, where a plain catenary is suspended over the public highway from wooden poles, ample insulation is offered by placing six insulators in series in each of the span wires and at the junction of these wires at one side.

On the 12,500-volt, single-phase line of the Midi Railway, the semi-rigid type of suspension, devised by M. Paul, chief engineer of this railway, is used. In this system the contact wire is part of a rigid girder suspended from cables which are anchored to the inwardly curved arms of successive steel poles of ladder design. A bracket to keep the contact girder in line extends outward from a point near the top "rung" of each pole. The insulation between the catenary cable and the contact wire system, and at the anchorages of the catenary is effected by means of link insulators. Drawings of this construction were presented in the ELECTRIC RAILWAY JOURNAL for July 6, 1912, page 26. Another Midi view shows the use of link insulators at an automatic tension installation on a bracket section. It will be observed that insulation was provided not only in the catenary and hanger wires themselves but also in the chain to which the tension take-up weight is hung. Still another example is afforded by the illustration of a sectionalizing pole with outdoor oil switch and horn lightning arresters on the 6600-volt single-phase line of the Libourne Tramways at Saint-André-de-Cubzac. Link insulators are inserted in the catenary and also in the section insulator as presented in the separate view.

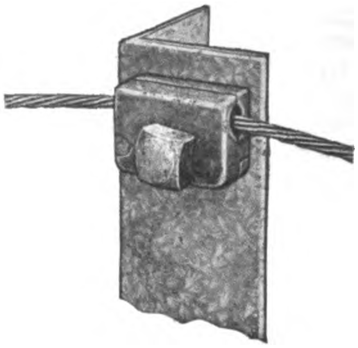


AUTOMATIC TENSION DEVICE WITH SUSPENDED WEIGHT ON MIDI RAILWAY

At a recent meeting of the Jovian League, of Lexington, heard the report of the delegates from that city who attended the Philadelphia convention. The delegates were most enthusiastic as to the future developments of electrical enterprises and advocated progress in Lexington. J. B. Fitzgerald, who was secretary of the local league, has resigned his position with the Lexington Utilities Company and goes with the Westinghouse Electric & Manufacturing Company. He has been succeeded temporarily as secretary by W. N. Hanna.

Easily-Adjustable Ground Wire Clamps

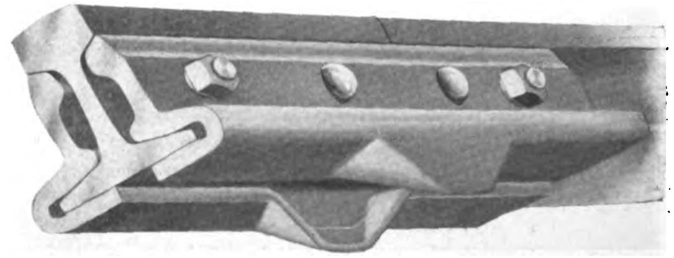
The accompanying illustration shows the improved Keystone ground wire clamp of the Electric Service Supplies Company, Philadelphia, Pa. It consists of two identical malleable iron castings, which when fitted together form a clamping jaw to receive either a ¼-in. or 5/16-in. strand. A ⅝-in. bolt of any practicable length is placed through these castings, thus allowing this clamp to be rigidly secured to either bayonet or other ground wire supports used in high-tension transmission line construction. These clamps may also be secured directly to wooden or iron poles by means of a through bolt when angle-iron supports are not used. A noteworthy feature which renders this clamp easy to install is that it requires but one bolt and it is so designed that it may first be secured to the bayonet or pole while the ground wire to be supported is placed therein afterwards. Greater wear is insured for that part of the ground wire inside the clamp on account of the corrugated surface and the flares at either end of the hole. Greater protection is given the strand owing to the small width of 2¼ in., therefore allowing a flare of ¾ in. at each end. The Type B clamps differ from the earlier standard type of this company in that the clamping surface is not corrugated but smooth, with flaring ends. All parts are heavily galvanized to withstand rust.



ADJUSTABLE GROUND WIRE CLAMP

Joint Combining Base-Supported and Suspended Features

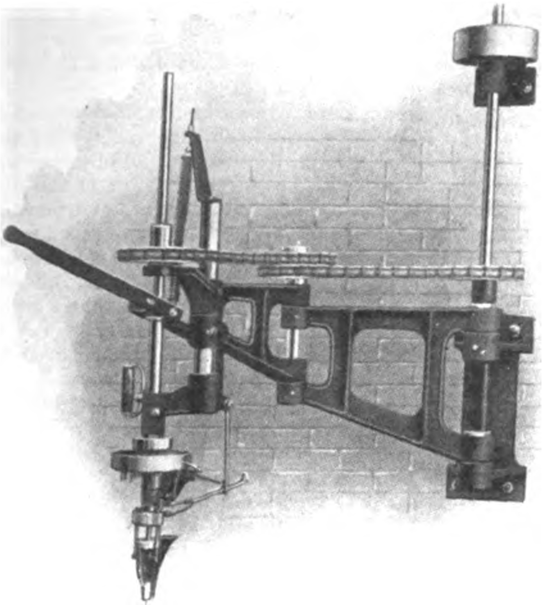
A novel rail splice has been developed by the Track Specialties Company, New York, by combining the salient features of the base supported and suspended joint. Since the weakest part of the track is where the two rails meet, the wave motion can be transmitted properly only with splice bars that have at least the same cross-sectional area as the rails connected. It is asserted that before the "Superior" joint illustrated was invented, no one had constructed a joint with a truss member at the center and provided for base supports immediately before it, without changing the sectional areas. With this joint, tie plates are not required, and the girder depth at the center of the joint is greater than the rail height. The structure at the junction of the two rails is theoretically stronger than the unbroken rail. The method of manufacture consists merely of rolling a bar as shown on the center portion of the splice. Then by means of a bulldozer the two ends are pressed up so that they support the rail base and rest on the ties. Spiking this joint is not recommended, although it is notched to suit if so desired.



JOINT WITH BASE-SUPPORTED AND SUSPENDED FEATURES

Automatic Screw-Driving Machine

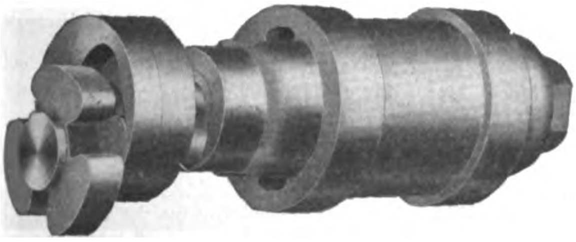
The accompanying illustration shows an automatic screw-driving machine, designed for operation within a 3-ft. radial area, which has been put on the market by the Stresau Engineering Company, Brooklyn, N. Y. This machine may be bolted to a wheel or post and is so constructed that the operation can easily and accurately bring the spindle into position on work which cannot be manipulated under an ordinary fixed drilling machine. The working stroke of the main spindle is 6 in., and the head of the machine has 9-in. vertical adjustment. The automatic screwdriver is attached to the machine spindle by means of its standard Morse taper shank. It may be detached in a moment and replaced by a different sized screwdriver or some other tool.



RADIAL MACHINE WITH AUTOMATIC SCREW-DRIVING ATTACHMENT

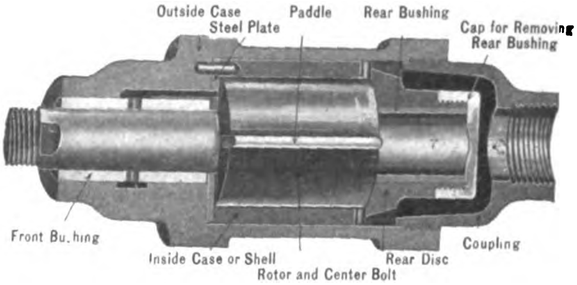
Turbine Cleaner With Vibrating Knocker for Fire-Tube Boilers

A new type of air or steam turbine-driven vibrator knocker head for dislodging scale from the outer surfaces of tubes in return tubular boilers has been recently put on the market by the Lagonda Manufacturing Company, and is shown in the accompanying illustrations. This cleaner also removes the soot from the inner surfaces of the tubes. The soot is loosened by the vibrating knocker and is blown out of the tube ahead of the cleaner by the steam or air exhausting from the front of the turbine.



VIBRATOR HEAD ATTACHED TO AIR OR STEAM DRIVEN TURBINE

The knocker head is made of three parts; a cylindrical body somewhat smaller in diameter than the boiler tube, and an eccentrically pivoted lever carrying a clover-shaped knocker on a stud at its free end. The lever fits flush into a triangular recess in the forward face of the main body, the free end swinging in an arc through the center of the head. The three hammer faces of the knocker are shaped to fit the inner circumference of the boiler tube, thus giving a large area of contact with the tube. This arrangement permits the hammer to be made heavy and a firm blow to be struck without injury to the tubes. The extra weight and force of blow facilitates the loosening of stubborn scale. The head is driven at high rotative speeds, the eccentrically pivoted lever carrying the knocker is thrown from side to side and the knocker caused to revolve on its axis at each contact with the tube, giving a resultant gyratory motion to the knocker and causing it to hit all points of the interior circumference of the tube.



SECTIONAL VIEW OF TURBINE CLEANER

The cleaner is fed into the tube by a flexible rubber hose which furnishes the air or steam pressure. The revolving motion of the head eliminates the necessity of turning the cleaner by twisting the hose. The motor for driving the head is intended for either steam or compressed air and is of the rotary engine type. The air or steam strikes upon radial paddles, thus giving a high rotative speed to the shaft. The paddles themselves are continually held out by the air or steam which is admitted to a chamber behind the paddles so that they always form a tight fit with the case. The motor has four paddles, two of which are always under pressure, so that it is impossible for the motor to stall. An oiling device for these motors mixes the oil with the air or steam supply, thoroughly blowing it into all the bearings and rubbing parts.

Railless Traction in Brighton, England

In his annual report W. Marsh, engineer and general manager of the Brighton Corporation Tramways, Brighton, England, refers to the recent demonstrations with railless cars, which were manufactured by the R. E. T. Construction Company, Limited, London, England. Mr. Marsh said in part: "These trials showed, without question, that, notwithstanding the fact that railless traction cars are dependent upon overhead wires for their power supply, this does not detract from their mobility in traffic, and augurs well for their future success in Brighton. The trials in question were very valuable in showing certain points where improvement could be effected. The Board of Trade was subsequently asked to sanction these, and did so, the result being that you will be able to make a start with vehicles which are an improvement on any in operation in this country at the present time."

The Società Brioschi, of Milan, has made public its plan for the construction of an electric railway from Borgo San Donnino to Salsomaggiore. It forms the first section of a main line from Borgo San Donnino to Borgo Taro, for which plans are now being matured.

LONDON LETTER

(From Our Regular Correspondent)

The nineteenth annual convention of the Incorporated Municipal Electrical Association was held recently at Birmingham. After the usual official welcome by the Lord Mayor, the address of R. A. Chattock, president of the association and chief electrical engineer of the Corporation of Birmingham, was presented. This was followed by a paper, "The Commercial Development of Electricity Supply in Moderate-Sized Towns," by W. A. Vignoles, chief electrical engineer of the Corporation of Grimsby. In the afternoon a visit was paid to the works of the General Electric Company, Ltd., at Witton, where there was a demonstration of electrical vehicles organized by the electrical vehicle committee of the association. The annual dinner of the association was held in the evening. The second day of the convention was held at Coventry. In the morning a paper, "The Design and Operation of Modern Boiler-House Plant," was read by S. E. Fedden, chief electrical engineer of the Corporation of Sheffield. In the afternoon visits were paid to various electricity works and electrical manufacturing plants in the vicinity. The third day of the convention was held at Stratford-on-Avon. Here a paper, "The Standardization of Tariffs," was read by J. Horace Bowden, chief electrical engineer of the Corporation of Poplar. In the afternoon, vehicles conveyed the visitors to Warwick Castle and grounds, returning via Kenilworth. The last day of the convention was devoted to the council meeting and the annual general meeting. On the afternoon of the last day a visit was paid to the Corporation electric generating station, and in the evening a Cinderella dance was given by invitation of the Birmingham entertainments committee.

The project of linking up the new colliery districts at Woodlands and Warmsworth with the Doncaster tramway service is to be proceeded with at once. The rails to the Woodlands will be laid on the grass margins at the side of the road.

The first-class tramcars in Birmingham have been abandoned. In response to a public request specially furnished cars were provided on the Hagley Road route, and the inside fares were doubled, while outside the fares were as usual. Only a small percentage of the passengers have paid the first-class fares.

The electrification of the section of the North-Eastern Railway, between Shildon and Newport, is nearing completion. The line, 18 miles long, is an important one, as it connects the Durham coal fields with the coast and with the great iron manufacturing district. Part of the line has been completed just outside Darlington, and upon this stretch the first of the ten electric locomotives, which are being built at Darlington, is undergoing preliminary tests. The overhead direct-current system is in use on the line. Power is to be generated at 20,000 volts and will be transformed in substations to 3000 volts direct-current for use on the trolley wire.

So as to prevent any misapprehension as to the cause of the discontinuance of the railless trolley service at Dundee, the general manager of the Dundee Corporation Tramways has recently reported that the system has been in operation for one year and eight months and so far as working is concerned has been an unqualified success. The real cause of the trouble has been the roadway. The service, therefore. has been discontinued until the road is put in a reasonably suitable condition.

The Leeds Corporation is seeking by means of a bill to extend the system of railless trolley cars into Wharfedale. Recently a select committee of the House of Lords sanctioned the extension, but laid down general conditions under which the vehicles should be run. The promoters have now introduced new clauses to carry out the decision, and the bill has been ordered to proceed. Those clauses provide that the Corporation shall pay 0.375 of a penny per car mile to the West Riding County Council, as the road authority, for the first three years after the service is started, and that at the end of that period the Corporation shall pay a sum equal to the extra expense incurred in repairing the roads as a result of the railway traffic.

The citizens of Bristol have decided to purchase the tramways from the Bristol Tramways & Carriage Company. The Bristol Corporation has a bill before the House of Lords which has been delayed awaiting the result of the recent poll in favor of the purchase. After passing the House of Lords the bill will have to go to the House of Commons, where further opposition is expected on technical points.

The results of the financial year of the Glasgow Corporation tramways department, which has just closed, constitute another record in respect of the mileage run by the cars, the number of passengers carried, and the revenue from fares. In round figures the number of miles run by the cars since June 1 of last year was 24,400,000; the number of passengers carried was 337,000,000, and the revenue £1,078,000. About 25,500,000 more passengers were carried during the year than in the preceding year, and the increase in revenue amounts to more than £70,000.

With the commencement of the new financial year of the Glasgow tramways, the Corporation has taken over third party risks incurred by the department. Following upon this step, James Dalrymple, general manager of the tramways, has issued a memorandum addressed to motormen and conductors. The aim of the department at present is stated to be a "safety campaign" of the same kind as have been introduced in the cities of the United States. Mr. Dalrymple indicates that he is prepared to recommend that a proportion of any saving in the cost of meeting claims which may accrue through the efforts of motormen and conductors be distributed among them.

The statement has lately been made that most of the street accidents in London happen on tramway routes. The London County Council is issuing a repudiation of the assertion. That the tramway is the safest vehicle, it states, is proved by statistics which indicate that more mishaps occur where there are no trams at all. In 117 miles of streets which are both tramway and motor-bus routes the fatalities caused by power-driven vehicles were, in 1910, 67; in 1911, 107, and in 1912, 126. The tram and bus shares of the accidents were in 1910, nineteen by trams and twenty-six by motor-buses; in 1911, eighteen by trams and forty-six by motor-buses; in 1912, twenty-one by trams and sixty-seven by motor-buses. In 119 miles of routes without trams the fatalities from motor-buses were in the same three years, twenty-three, thirty-nine and seventy. The two divisions of the Metropolitan police which have the largest average number of fatalities per square mile for 1910, 1911 and 1912 are St. James's, with 11.40, and Marylebone, with 8.98. Neither of these has tram lines. The Council, too, quotes the views of other than London experts on the question. Thus, the chief constable of Manchester says that where there is great traffic there must necessarily be a greater risk of accidents, but that the risk is not caused by the tramcars, adding that the motor-bus is a greater danger than the tramcar. The traffic manager of the Glasgow Tramways is even more emphatic, asserting that the tramcar running on a fixed rail is the safest vehicle of the streets. The head constable of Liverpool also regards tramways as less dangerous than motor-bus services, and the chief constable of Birmingham, too, refuses to admit that traffic dangers are due to tramcars exclusively, saying that accidents in busy streets would be as numerous if there were no tramways.

The revenue account of the Manchester Corporation Tramways shows an income of £925,309 as compared with £887,646 in the previous year. The working expenses were £585,223. The financial results per car mile show the revenue to be 11.410d., as against 11.351d. in 1912 and 1913. The working expenses were 7.216d., as against 7.132d. The increase in the traffic expenses is accounted for by the increased scale of wages adopted for nearly all grades of labor chargeable to this account. The consumption of electrical energy per car mile shows a further decrease, notwithstanding the increased number of cars fitted with top covers. Commenting upon the reduction of fares, the report states that the effect of the change was found in the increase of 17,933,558 in the number of passengers carried—205,608,741 against 187,675,183. The number of parcels carried on tramway-cars last year was 1,303,353, as compared with 1,189,143 the previous year. The total profits in this department were £3,641. The first year's profits in 1907 were £265. There are now 662 cars ready for service. A. C. S.

News of Electric Railways

Deficit Predicted for Washington Roads Under Municipal Ownership

Clarence P. King, president of the Washington Railway & Electric Company, has made public figures which indicate that the passage of the Crosser bill for the government ownership of the electric railways of Washington, D. C., would cause an annual deficit of at least $1,000,000. The computation upon which Mr. King's figures are based is as follows:

Market value on June 15, of securities of Capital Traction Company and Washington Railway & Electric Company	$48,483,617
Minimum estimated District of Columbia bond issue	50,000,000
Interest on district bonds at 3.65 per cent	1,825,000
Necessary for sinking fund per annum	1,000,000
Total fixed charge	$2,825,000
Net revenue of two roads after operating expenses, taxes, but not interest, 1913	2,263,374
Minimum estimated deficit	$561,626

Mr. King has based his figures upon the expectation that the condemnation would approximate the present market value of the securities of the lines. As the district bonds are to be a lien only upon the actual income of the railroad properties, it has been assumed that the bonds will have to be sold below par. The $2,263,374 net revenue for 1913 represents the net earnings of the lines after paying operating expenses and taxes, but not the interest on the bonds. The $1,000,000 sinking fund item is worked out on a basis provided in the bill that the commissioners of the District shall set aside each year for twenty-seven years a sum sufficient when invested to redeem the bonds at maturity.

A favorable report on the Crosser bill has been ordered by the District committee of the House of Representatives, and it was promised that an attempt would be made in the House on June 22 to call the bill up for action. The district day on the House calendar, however, was displaced to make way for the sundry civil appropriation bill. The next District day will be July 5, and that probably will be displaced by the July 4 holiday.

New York Subway Construction Contracts

The Public Service Commission for the First District of New York will soon advertise for bids for the construction of Section No. 5 of Routes Nos. 4 and 36, the crosstown portion of the Broadway-Seventh Avenue and Fifty-ninth Street subway. Bids will be opened on July 24. The Broadway subway, which is to be operated by the New York Municipal Railway Corporation, runs up Broadway to Forty-second Street, where it crosses underneath the existing subway and continues up Seventh Avenue to Fifty-ninth Street. Here the four-track construction ends, but two tracks curve to the eastward and run to and over the Queensboro Bridge to a connection with the new rapid transit lines in Queens.

A public hearing will be held July 23 before the commission upon the terms and conditions of the proposed contract for the construction of Section No. 3 of Route No. 33, the Whitehall-Montague Street subway and tunnel line, for operation by the New York Municipal Railway Corporation. The contract for the Manhattan end of this line, as well as for the tunnel under the East River, has already been let. After the public hearing is held the commission will put the contract in permanent form and advertise for bids for construction.

The commission in a few days will advertise for bids for the finish work in six stations on the extension of the Fourth Avenue subway in Brooklyn between Fortieth and Ninetieth Streets. Bids will be opened on July 23. The work to be done includes everything necessary to complete the stations and station approaches.

Bids for making borings along the lines of proposed rapid transit railroads in Manhattan, Brooklyn, Queens and The Bronx will be opened by the commission on July 10. This contract will include both land and river borings.

Coalition of American Cities to Combat Corporations

A coalition of five representative American cities has already been effected, which, in the words of the promoters, will "fight the combination of municipal utility corporations, big and little, that has for a generation operated to thwart municipal progress and growth." Mayor Blankenburg of Philadelphia conceived the plan of campaign. Those who have approved the movement include Mayor Mitchel, of New York; Mayor Harrison, of Chicago; Mayor Baker, of Cleveland, and Mayor Shroyer, of Dayton, Ohio. A conference is to be held this fall in Philadelphia, when a permanent organization will be established. A letter has been sent from Philadelphia to mayors of cities throughout America, setting forth the need of such an organization and inviting them to participate in the conference. This letter, signed by Mayor Blankenburg, follows:

"The city of Philadelphia is preparing to bring, in the early autumn, a case before our new Public Service Commission, in which that body will be asked to pass upon a proper schedule of rates for electric light and power. In the course of our investigations and reviews of hearings on this subject, we have come to realize that the side of the people has seldom, if ever, been adequately presented before other public service commissions, while the interests of the public utility companies are presented and argued by the best informed and most able men in the country. If the cities do not join for the presentation of their cases as the public utility companies have, the laws and precedents established by the commissions stand in danger of being biased by the able arguments of the representatives of these corporations.

"The equipment required for an adequate presentation of the rights and interests of the people involves a degree and extent of technical knowledge and information which it is not practicable for any one city to obtain. This knowledge and information is much the same for each city, and its cumulative use would greatly add to its value. It must be borne in mind that the utility companies constitute themselves an offensive and defensive alliance, probably stronger than any other interest in this country. Its weakest member is never without information and assistance of every kind.

"To meet this situation it has been suggested that there should be formed a bureau of public utilities research which shall equip itself to give to the cities the same able assistance which the public utility companies' associations give to the public utility companies, thus in effect constituting an offensive and defensive alliance among the cities similar to that existing among public utility corporations.

"To this end we are preparing to form a permanent organization of this character. I am writing to you to ascertain your interest in this matter and to ask whether you would be represented at a nation-wide conference of city officials to be held in this city in the autumn to discuss the various phases of public utility problems as affecting the people, and how they may best be dealt with.

"Mayor Mitchel, of New York; Mayor Harrison, of Chicago; Mayor Baker, of Cleveland, and Mayor Shroyer, of Dayton, join me in making this inquiry. Mayor Mitchel and Mayor Harrison will personally represent New York and Chicago at this conference. We are confident that the result will be a great step forward in the matter of securing a proper presentation of the people's side in utility cases."

In discussing his plans, Mayor Blankenburg said:

"We believe most heartily in the principle of regulation through public service commissions, and we want to coöperate with the commissions by presenting the citizens' side at their hearings as effectively as the corporation side has been presented in the past, so that these commissions will not be placed in the rather unfair position of having to judge a situation where only one side is adequately presented. We hope and expect that through public service commissions the problems now rising in regard to public utilities are going to be adjusted to the satisfaction of all concerned. The sooner the people's side of the question is adequately and fairly presented before these commissions, the sooner they will come to some final and permanent standard of decisions. We believe that the proposed bureau of public utilities research should be purely a people's institution, with no leading strings of any kind attached to it. It will be at the service of all citizens and mayors and city officials everywhere. Even the tax rate is of interest only to those who have property to be taxed. But the service rendered and the rate charged for gas, electricity, water and street cars reaches and affects every single individual in the entire city, and it affects with special force those of moderate incomes. I feel that we have been slow in recognizing this responsibility and responding to it. No officers have yet been elected for the proposed bureau of public utilities research nor have the details of the organization been worked out. It is expected that every city of any considerable size in the country will be represented at the convention this fall. The bureau is for the present being financed by some private individuals."

Preparing for the Kansas City Franchise Vote

The extension of the franchise of the Metropolitan Street Railway, Kansas City, Mo., to be voted on July 7, was recently endorsed by the Kansas City Commercial Club, the leading commercial body, by a vote of 330 to 36. The Real Estate Board, the German-American Alliance and other organizations already had come out in favor of the grant.

In anticipation of the election, 208 canvassers were recently appointed to cover the city and ascertain how many voters have been disqualified by moving and in other ways. The company waived the right to appoint the canvassers, each of whom will be paid $4 a day. This expense, however, will be borne by the company.

The attitude of labor on the franchise is indefinite. Newspapers adverse to the measure have attempted to create unfavorable sentiment among the laboring classes by alleged misquotations. Those favoring the grant, on the other hand, have given publicity to the receivers' statements as to their position and assurances that labor will receive a fair hearing.

Paid advertisements were run recently by a group of leading business men calling attention to a meeting held at the Baltimore Hotel. At that gathering sentiment was distinctly favorable to the extension, most of the speakers asserting that business in general is being retarded by the unsettled conditions regarding the street railway. Anti-franchise meetings on the streets have been held by labor agitators, aroused over the failure of employees of the company to organize before the holding of the election.

Judge W. C. Hook of the United States District Court has advised the company's creditors to accept the proposed franchise. Philip J. Kealy, and others interested, have spoken before the City Club and other organizations, answering objections to the franchise and otherwise outlining the company's position.

The Metropolitan Street Railway has been active in other respects. The Kansas City *Star*, a bitter opponent of the franchise, recently hit upon the idea of creating interest in the election on July 7 by running numerous placards through the paper: "Kansas City's Day, Tuesday, July 7." The company was so favorably impressed by this line of action that it has equipped all of its cars with the same slogans, similar to the productions of the *Star*. Script was used in the signs instead of ordinary lettering. The street railway secured the reproduction by photographing and enlarging the newspaper's signs.

In addition, the company has placed boxes in all cars containing copies of three bulletins which have been issued. The brochures discuss the franchise, answering all questions asked the company and analyzing the salient points of the contract.

The Kansas City Railways, which will take over the system in Kansas City if the franchise is passed, has filed an application with the Missouri Public Utilities Commission for authority to issue $5,000 additional common stock. The application was filed by Frank Hagerman, attorney for the receivers.

Every precaution is being taken to insure a fair election on July 7.

Wage Agreement Modification in Cleveland

J. J. Stanley, president of the Cleveland (Ohio) Railway, announced to a committee representing the local branch of the Amalgamated Association of Street & Electric Railway Employees on June 24, that he could not consent to their demand for an eight-hour minimum day. He told the men, however, that he was willing to increase the wages of the men who have been with the company more than a year from 30 to 31 cents an hour and fix a minimum day of five hours. Estimates made by the company show that the change in the schedules, with a minimum day of eight hours, would increase the operating expenses $321,000 a year. According to the estimates of the union the increase would be $527,000 a year. Mr. Stanley said that an increase of from $125,000 to $140,000 per year is all that he was willing to grant and that the figures he mentioned would just about cover this.

The following day the committee called upon Peter Witt, street railway commissioner. He told them that he had had in mind an increase of $150,000 a year as a maximum and that he would not be willing to recommend a greater amount.

The committee did not accept Mr. Stanley's proposition, but stated that the schedules would be gone over to see if any change can be made in them that will bring the total figures to approximate those mentioned by Mr. Stanley.

It is said that if the demands are granted the fare would have to be advanced to 4 and possibly to 5 cents. Mr. Witt feels that he cannot recommend anything that will result in an advance in the fare.

The conductors and motormen have arranged to vote upon the proposition made by Mr. Stanley relative to new schedules and wages for the men. The conditions imposed are that the revised schedules, as prepared by the subcommittee, be made the forms of schedules after which all future schedules shall be made; that all present schedules be revised to comply with these forms on the conclusion of this agreement; that all the runs in future schedules which do not furnish trainmen five hours or more time on any calendar day pay five hours' time; that trainmen who are called upon to work a run of less than five hours will, whenever called upon by the dispatchers, do other work to the extent of five hours without extra compensation, but should the work require more than five hours, pay be made for the actual time employed; that the rate of pay for conductors and motormen who have been in the employ of the company less than one year be 27 cents per hour and for those who have been in its employ one year or more be 31 cents an hour. The proposal depends upon the city's action in granting an increase in the operating expenses sufficient to meet the cost imposed by the new agreement.

The Salem Fire

A conflagration resulting in an estimated loss of $10,000,000 occurred at Salem, Mass., on the afternoon and evening of June 25. The fire rendered about 20,000 persons homeless and consumed approximately 1000 buildings, sweeping the shoe and leather district and many residential streets. Early in the evening the city was placed under martial law, and although dynamite was freely used to check the flames, strong and shifting winds carried the fire over an area about 1.5 miles long and 0.5 mile wide. The loss of life was small.

The damage to the property of the Bay State Street Railway was confined to the overhead system and the wharf of the maintenance of way department. The company carried thousands of refugees and sightseers. Several hours after the fire started it became necessary to cut the cables serving the main lines of track entering the city from the south and west, and cars were then run only to the Salem High School. The next afternoon cars were again operated to the center of the city, temporary feeders having been erected. On Sunday the company handled the largest local traffic in its history. The Boston Elevated Railway, the Bay State Street Railway and the Boston & Worcester Street Railway carried several companies of militia to the scene of the fire early on June 25, and all these transportation organizations have since handled supplies for the sufferers free of charge.

Action Unlikely in Connecticut Mail Case

The post-office department will continue its experiment with automobiles in transporting mail in Connecticut for an indefinite period, according to information given out at the office of the Second Assistant Postmaster-General at Washington, in relation to the refusal of the Connecticut Company to continue the service. The post-office authorities will make no effort to have the company re-establish its mail service, even though the government claims that the contract with the company had not expired. As previously stated in the ELECTRIC RAILWAY JOURNAL the company asked to be relieved of side and terminal service at fifty-four stations, and also wanted the number of mail pouches to be carried on any one trip limited to six. The post-office department offered an increase in pay and to relieve the company of side and terminal service at thirty points, but was unwilling to yield on the number of pouches to be carried, in as much as such a course would probably mean a delay in delivery. The company therefore discontinued the service.

New Power Station for New Jersey System

Public Service Corporation of New Jersey, Newark, has preliminary work under way for the construction of a large power station at Point-no-Point on the Passaic River. The site, which is located about 2000 ft. north of the Plank Road, has an area of 16 acres and the plant will be known as the Essex Station as it is intended to take care of the business in the county whose name it will bear. The ultimate capacity of the plant will, according to the present plans, be 150,000 kw. It is not intended, however, to build the plant to capacity at once but something like $2,000,000 will be spent within a year and the station will be so designed that it can be enlarged to meet the demands of future growth.

Much has already been done in the way of preparing the ground and securing data to pave the way for the awarding of contracts. As the land was practically inaccessible for business purposes the company built a road, about 2000 ft. long, from Blanchard Street to the property. This was constructed of broken stone and cinders, on a foundation of old poles and railway ties laid crosswise on the meadows mud, and the whole forming a highway capable of supporting heavy trucking. A spur of the Manufacturers Branch Railroad has also been laid across the site to what will be the turbine room. Twenty-seven test piles, ranging in length from thirty-five to fifty-five feet have been driven to determine the resistance of the soil and water borings were made to provide data upon which to base specifications for foundation and dock contracts. The tests have shown a depth of 9 ft. of marsh mud, underneath which were 2 ft. of mud, 12 ft. of sand, 2 ft. of gravel, 14 ft. of red sand, 4 ft. of clay and 2 ft. of rock for a total depth of 45 ft.

Proposals have been invited for the building of a dock which will have a total length of 682 ft. and extend from the pier head line back to the present high water mark, a distance of about 65 ft. Contractors have been asked to submit alternate figures for three different types of docks, concrete, timber crib and a combination of concrete and timber crib. The top of the dock is to be 30 ft. above the bottom of the government channel and the solid portion of the structure will be 16 ft. wide. Behind that the space will be filled with material dredged from the river as the company will provide itself with a depth of 10 ft. at its proposed dock with the depth sloping to the present 20-ft. channel in the river. The top of the dock will be 18 in above the highest flood tide mark of which there is any record and the foundation of the station will be as high to preclude probability of trouble from high water.

Intakes for condensing water will be built through the dock and the latter will be arranged to accommodate the coal handling machinery. Incidentally the company will have the water route and two railroads to carry its coal supplies and there will be coal storage facilities sufficient to take care of all the company's power stations in the northern part of the State, if necessary or desirable.

It is proposed to build the station on a line with the outermost point of the present land, that is to construct it on foundations laid between the existing high and low water marks. In its finished state the building will be 366 x 285 ft. but the intention is to get along with a structure 366 x 154 ft. until such time as an addition will be necessary. There will be a turbine room, a boiler house and a switch house. Two turbines of 25,000 kw capacity each will be installed leaving room for a third and at the outset space will be provided for eight boilers although only four will be set up. It is expected that bids will be asked for the foundations early in August and that the plant will be in operation in the late summer or early fall of next year.

Mr. Mellen's Hopeless Tangle

Everybody's Magazine for July contains an illustrated interview by Garet Garrett with Charles S. Mellen, former president of the New York, New Haven & Hartford Railroad. Mr. Mellen states that the acquisition of the electric railways estranged public sentiment more than anything else the New Haven did. In this connection Mr. Mellen is quoted as follows:

"I was trying to secure control of the trolleys contiguous to the lines of the New Haven because I had the theory and belief that, first, all railroads were going sooner or later, especially in congested communities, to be operated by electricity. Then there was a great economy in the erection of large units in the way of power houses to furnish the electricity for both systems of transportation. It is my conviction that the beginning of government ownership of railways is almost imminent in this country. But I said to myself: 'Though that is so near at hand, it will be many years before public sentiment will submit to government ownership of street railways.' Therefore I proceeded to tie the New Haven Railroad and its electric railways so tight that it would be very hard ever to untie them. I made street railway mortgages that were also a lien on a part of the New Haven Railroad, and then railroad mortgages that were also a lien on parts of street railway systems, saying to myself as I did it: 'Now when they come to New England with their schemes for government ownership of railroads they will look it over and lift up their hands in despair. They can't take the railroads without the trolleys, and the public will not stand for their taking both.' The result is that now the department of justice is in despair. It is a hopeless tangle, as I intended it should be."

St. Paul Electrification Progress

C. A. Goodnow, assistant to the president of the Chicago, Milwaukee & St. Paul Railway, made the following statement about electrification at Great Falls, Mont., recently:

"My first purpose on this visit to Great Falls is to get things started toward the electrification of our terminals in Great Falls in order that we may keep our word with the city that the work would be completed by Jan. 1, 1915. Electrification of the terminals will be under Mr. Beeuwkes, our electrical engineer in charge of electrifying our main line between Avery, Idaho, and Harlowton. The exact time of starting actual construction could hardly be fixed now because there are a mass of details that must be worked out.

"There has been some disappointment on our part in the fact that the construction of our passenger station at Great Falls has not gone forward as rapidly as we had hoped. The delay has been due to hindrances in getting the brick needed, but we hope now the work will be pushed with all possible speed until the station has been completed. Ballasting the line is going forward quite satisfactorily just now. New grades do not stand spring freshets well and there has been some trouble between Great Falls and Lewistown. However, we shall have no difficulty, we now believe, in getting the road ballasted and opened to scheduled service by Aug. 1.

"Concerning the electrification of the main line which is in charge of Mr. Beeuwkes, there is only the best report. The trolley poles and the transmission poles are arriving in plentiful quantity and are being set promptly, so we are certain not to be delayed from that source. As has been announced, the plans and specifications for the locomotives, and the equipment which will be needed in the substations and in other ways in making the change to electric power are now in the hands of the manufacturers. Naturally, with assurance of being ready so far as the installation of the trolley and transmission lines by the time we have set, Jan. 1, we shall hope to get the equipment as nearly on time as the makers can deliver it, but until the bids have been opened it would hardly be wise to predict what the bidders will offer on the time for delivery. It is a safe prediction, it seems to me, to say the date of actual operation by electricity will not be delayed long, if at all, beyond Jan. 1, 1915."

Chicago Engineer Removed by Mayor Harrison

By a vote of forty-one to eighteen, with six Aldermen excused from voting, the Chicago City Council on June 29 concurred in Mayor Harrison's removal of George Weston as the city's representative on the board of supervising engineers. Mr. Weston still holds the position of chief engineer of the board.

The transportation committee of the City Council inquired on June 30 into the methods of procedure followed by the board of supervising engineers. Walter L. Fisher appeared as counsel for the board. Corporation Counsel Sexton conducted the inquiry for the committee. Both B. J. Arnold and Mr. Weston were examined. During the inquiry Mr. Sexton asked the board to produce the complete record of opinions furnished to the board by the Corporation Counsel. Both Mr. Fisher and Alderman Capitain were in favor of having the investigation disposed of as soon as possible. The members of the committee, however, determined to defer until fall all further consideration of the accounting charges against the board. Mr. Arnold and some of the other Aldermen also protested against the postponement of the launching of a new investigation before the pending charges had been disposed of. In this connection, Alderman Capitain said that he wanted to criticise the parties that submitted the order—the same parties that appealed to the Council for $50,000 for a new audit.

At the suggestion of the Mayor the City Council has referred to the finance committee the Mayor's request for an appropriation of $50,000 for a new audit of the street railway companies' books.

Chicago advices state that Mayor Harrison has decided to appoint Edward W. Bemis, public utility expert, as the city's representative on the board of supervising engineers to succeed Mr. Weston.

Toledo Citizens' Franchise Considered Informally

A meeting of the special franchise committee of the City Council of Toledo, Ohio, was held on the evening of June 30. The franchise submitted by the Toledo Citizens' Franchise Association was discussed. Mayor Carl H. Keller was in Columbus, City Solicitor Thurstin remained only a few minutes when he found that no official discussion was to take place.

J. R. Cowell, representing the Non-Partisan League, has announced that his organization will have a franchise proposal ready for submission soon. This proposal, it is understood, will be similar to the franchise of the Cleveland Railway. The Non-Partisan League is operating on the idea that municipal ownership will be the ultimate end, but that the city is not yet ready to take over the properties of the Toledo Railways & Light Company. The franchise committee has informed Mr. Cowell that it will be glad to consider any proposition that is likely to hasten a settlement of the franchise question.

Frank L. Mulholland, of the Citizens' Franchise Association, requested the committee to fix upon an early date for a meeting to take up the negotiations on the proposed franchise. It was decided to hold a joint conference of the franchise committee of the City Council and the Citizens' Franchise Association on July 2.

The impression prevails that if the franchise committee does not recommend some action to Council within a short time steps will be taken to initiate the proposal of the Citizens' Franchise Association and get it before the voters. Councilman F. M. Dotson is quoted as saying that negotiations with the company will be continued no matter what other movements are inaugurated.

The Municipal Ownership League filed petitions containing 8000 names with the City Auditor on June 30, asking that its proposal be submitted to the voters. This organization proposes to issue $8,000,000 of bonds with the proceeds of which the city is to purchase the railway, lighting, power, gas and heating properties of the Toledo Railways & Light Company. The Municipal Ownership League favors the immediate acquisition of the railway properties by the city and is pledged strictly to support that plan.

It seems likely that there will soon be a three-cornered effort to settle the question under way, but it is believed the business men's proposition is so strongly supported that it will of necessity take preference over all others in the order in which they are taken up for consideration.

The company has done little the last two weeks toward a settlement. Mr. Doherty and the officials are waiting for developments from the efforts made by the Toledo Citizens' Franchise Association before taking further steps. It is the intention to afford every opportunity to the city to work out a satisfactory proposition, since the plan presented in behalf of the company did not meet the approval of the administration. The company, however, looks to the city to follow out the mutual understanding arrived at when the company suspended its order to collect the old rate of fare and proceed in earnest to reach a settlement.

Henry L. Doherty has been in New York for a week. This is the first time he has been absent from Toledo in more than three months. He was expected to return on July 1.

Even if the city should vote in favor of municipal ownership, following the petition filed with the auditor, Councilman Dotson explained that it will be necessary to extend the present franchise. Several years would be required, he said, to take over the properties.

Westinghouse Strike Situation

A company of the State Constabulary of Pennsylvania went to East Pittsburgh on June 29 for the purpose of assisting in the maintenance of order in the district affected by the strike of employees of the Westinghouse Electric & Manufacturing Company. The State Constabulary were sent at the request of Sheriff Richards, of Allegheny County, made after a demonstration by strikers which threatened disorder.

Employees of the Union Switch & Signal Company who walked out on June 12 have returned to work. Col. H. G. Prout, president of this company, in announcing that all the men had returned to work, said:

"This walkout was an Industrial Workers of the World effort thinly disguised, and the men went out without presenting any grievances, demands or requests. No concessions whatever have been made by the company."

I. C. C. Report Concerning New Haven Railroad.—It is reported that the findings of the Interstate Commerce Commission in response to the resolution of the Senate authorizing its recent investigation of the New York, New Haven & Hartford Railroad will be submitted to the Senate within the next two weeks.

Striking Employees of Kansas Road Return to Work.—Five former employees of the Union Traction Company, Coffeyville, Kan., who went out on a strike on March 31, have applied for reinstatement. The company accepted their applications as individuals, declining to recognize the union. Other men are expected to return shortly.

Extension of Time Granted.—The Public Service Commission of the First District of New York has granted the Hudson & Manhattan Railroad an extension of time from June 28 to Oct. 1, 1914, within which to begin the construction of the extension of its system from Thirty-third Street and Sixth Avenue, New York, to the Grand Central Station at Vanderbilt Avenue and Forty-second Street.

Proposed Radical Action in Pittsburgh Not Approved.—Councilman G. A. Dillinger, of Pittsburgh, on June 16 presented a resolution in the City Council, instructing the city law department to take steps to force the Pittsburgh Railways into the hands of a receiver. Several days previously the Mayor and the Council had agreed to let the law department compile all the complaints against the company and then take them up with the company. The Council, on June 24, postponed action on the Dillinger resolution for a week.

Ohio Tax Valuations.—The net increase in valuation on all street, suburban and interurban railways in Ohio, as reported by the tax commission, is $4,834,890 over last year. The total valuation of all properties is $145,476,000. The largest increase was imposed on the Cleveland Railway, which some time ago brought an injunction suit against the treasurer of Cuyahoga County to prevent the collection on all valuation over a certain amount. The increase for the Columbus Railway, Light & Power Company was about $553,000.

Small Line Abandoned.—It has been decided to abandon the line of the Orange Mountain Traction Company, West Orange, N. J., which operates from the foot to the top of Orange Mountain, a distance of 1½ miles. The system was installed about six years ago and has never been operated at a profit. The decision to abandon the property was reached on account of the inability of the company to secure an extension of its rights so as to permit it to discharge passengers near the station of the Delaware, Lackawanna & Western Railroad in West Orange. The town of West Orange has since bought in the property to satisfy $1,500 in taxes past due.

Indianapolis Business Men Visit Utilities.—Five hundred business men of Indianapolis took the fourth industrial excursion Saturday afternoon, June 20, and visited the property of five public utilities corporations. The excursion was under the auspices of the municipal development division of the Indianapolis Chamber of Commerce. The first visit was to the Tenth Street power station of the Terre Haute, Indianapolis & Eastern Traction Company. Robert I. Todd, president of the company, addressed the visitors at the plant. Other utilities visited were the works of the Indianapolis Water Company, the Langsdale Avenue plant of the Citizen's Gas Company, the Mill Street plant of the Indianapolis Light & Heat Company and the Washington Avenue plant of the Merchant's Light & Heat Company.

New York State Railways to Arbitrate Wage Question.—Employees and officials of the New York State Railways have agreed to arbitrate the question of whether wages shall be increased. This arrangement is in compliance with the agreement effective on May 1, 1914, and continuing until May 1, 1915, which covers all new working conditions, with the provision that if the two parties concerned cannot agree upon wages the matter shall be left to arbitration. Two of the three arbitrators have already been selected. Thomas Spratt, Ogdensburg, N. Y., will represent the company and James E. Roach, Schenectady, N. Y., the employees. Both sides have agreed to ask Charles P. Neil, New York, N. Y., formerly United States Commissioner of Labor, to accept the position of third arbitrator. It is not yet known whether Mr. Neil will accept this position as he is away in the West at present. He is, however, expected home shortly.

Bankers Inspect Chicago Elevated Railways.—The property of the Chicago (Ill.) Elevated Railways was inspected on June 22 by the representative of the banking firms which were members of the syndicate which underwrote the $12,500,000 of first mortgage 5 per cent bonds of the Northwestern Elevated Railroad. The members of the party, which also included a number of bankers who participated indirectly in the underwriting, made the trip from New York and Boston on a special section of the Twentieth Century Limited which left New York on Sunday forenoon, June 21, and returned to the East on the Twentieth Century Limited, leaving Chicago at noon on Tuesday, June 23. The inspection trip started from Fifth Avenue terminal of the Metropolitan West Side Elevated Railway at 11.10 a. m. The itinerary was west over the Garfield Park branch of the Metropolitan Elevated to Forest Park, thence downtown and to the Jackson Park terminal of the South Side Elevated Railway and thence north to the Wilmette terminal of the Northwestern Railway. On the return trip the Ravenswood branch was inspected. Luncheon was served en route. After the inspection of the elevated lines the guests were taken by automobile to the plant of the Commonwealth Edison Company, by which the elevated railway is supplied with power.

Financial and Corporate

Stock and Money Markets

June 30, 1914.

In the early trading on the New York Stock Exchange to-day a weak tone was shown. Good buying, however, followed the recessions at the opening of the market with the result that there was an abrupt change in the market tendency. In the last half of the day the range of prices was unusually high. Nearly all the important issues were up one point or more at the close. Rates in the money market to-day were: Call, 2 per cent; sixty days, 2½ per cent; four months, 3 per cent; six months, 3½@3¾ per cent.

In Philadelphia to-day most of the local issues ruled fractionally weaker and were in very light demand.

The Chicago market was broader to-day and firm. The volume of sales was small, however. Bonds were steady and in fair demand.

The Boston market was dull to-day. Prices advanced all along the line, however, and were best at the close.

The Baltimore market was narrow and inactive to-day. Sales of stock totaled 2550 shares, mostly Elkhorn Fuel common. Bond transactions totaled $30,700, par value.

ANNUAL REPORT

Portland Railway, Light & Power Company

The comparative earnings statement of the Portland Railway, Light & Power Company, Portland, Ore., for the years ended Dec. 31, 1913 and 1912, follows:

	1913	1912
Gross earnings	$6,723,742	$6,642,308
Operating expenses (including taxes)	3,298,310	3,328,911
Net earnings	$3,425,432	$3,313,397
Interest	2,008,601	1,760,991
Surplus	$1,416,831	$1,552,406

The gross earnings of the company increased $81,434 during the year, or 1.2 per cent, while the operating expenses, including taxes, decreased $30,601, or 0.9 per cent, giving an increase in net earnings of $112,035, or 3.4 per cent. Interest charges increased 14.1 per cent, causing the surplus to decrease $135,575, or 8.7 per cent. There was available for depreciation renewals and dividends an amount equal to 5.7 per cent on the par value of the capital stock. The small increase in gross earnings was due principally to the business depression in the Pacific Northwest, although it was somewhat affected by the fact that comparison was made with a year during which revenues were received from the Salem Railway and the Williamette Falls Railway, both of which were sold in 1912. The operating ratio was reduced from 42.9 per cent to 42.5 per cent in 1913.

There was an increase in mileage per car per day on the city lines from 150 to 156, brought about through rerouting, alternate stops and the elimination of layovers. This caused a reduction in operating expenses per car mile sufficient practically to cover the increased wages of one cent an hour granted to the motorman and conductors. There was a heavy increase in fixed charges due to the completion of the Mt. Hood hydroelectric plant, and a transfer of the interest charge of this investment from the construction accounts to the operating accounts. Owing to the decrease of 8.7 per cent in the surplus, the dividend on the capital stock which had been paid at the rate of $5 per share per annum from December, 1912, was reduced to $4 per share per annum on Dec. 1, 1913.

Considerable construction work was done during the year, including the Mt. Hood plant at Bull Run, the Big Sandy diversion dam and the installation of a 7500-kw turbine. The electrification of the Mt. Hood Railway in July reduced the operating expenses and materially increased the business of the line. The electric business of the company was more widely developed during the year, as is shown by the fact that on Dec. 31, 1913, the company served 42,063 light and power customers, as compared with 38,415 in 1912. During the year $1,377,553 was charged to the construction account, of which $542,081 was for railway extensions and improvements, $68,401 for new cars, $60,736 for carhouses and $208,201 for power plant, substations and transmission lines. The above total is slightly less than for the average capital expenditures made during the years 1906 to 1912, inclusive. The item for new cars covered the purchase of four passenger cars and twenty freight cars.

The report states that during the year the application of scientific management was continued, covering the operation of the light and power department, the railway shops and the maintenance of way department. Furthermore, it has been asserted by competent judges that the company has gone further with the introduction of efficiency principles than any other public utility corporation in the country. The results have been so satisfactory that the work is being extended to include practically all departments.

Pensacola Electric Company

The annual report of the Pensacola Electric Company, Pensacola, Fla., for the twelve months ended Dec. 31, 1913, shows gross earnings of $285,757, an increase of $328 over 1912. These total earnings were divided $145,520 to the railway department, a decrease of $7,693, and $140,237 to the light and power department, an increase of $8,021. The operating expenses were $172,196, an increase of $5,754 over those of 1912, and taxes amounted to $10,542, an increase of $525. The net earnings of $103,020 were a decrease of $5,950 from those of the preceding year. Interest charges increased $4,718, which, with the dividends, prior surplus and replacement reserve, gave a current surplus of $43,174, a decrease of $3,806. The percentage of operating expenses, not including taxes, to the gross revenues was 60.3 in 1913, comparing with 58.3 in 1912, 59 in 1911, 58.4 in 1910, 57.3 in 1909 and 69.2 in 1908. The number of passengers carried during the year, including transfers, amounted to 3,116,615. The number of transfers taken up showed a total of 511,229.

American Cities Company

The income, profit and loss statement of the American Cities Company, New York, N. Y., for the twelve months ended Dec. 31, 1913, is as follows:

Dividends on stocks owned	$1,809,162
Interest on debentures owned	5,676
Interest on bank balances	10,447
Interest on notes and accounts receivable	23,442
Contract for services	1,583
Total receipts	$1,850,310
Operating expenses and taxes	57,624
Net earnings	$1,792,686
Interest on collateral trust gold bonds	500,000
Net income	$1,292,686
Dividends on preferred stock, 6 per cent	1,233,210
Surplus for period	$59,476
Surplus Jan. 1, 1913	135,518
Surplus Jan. 1, 1914	$194,994

The annual report states that the income of the company as set forth above is wholly from dividends declared and paid on stocks of the various constituent companies except the comparatively small amount received as interest upon loans and cash balances. If the proportionate interest of the American Cities Company in the undivided earnings of the constituent companies were added to the surplus earnings as shown above, the results for the year 1913 would be $255,194, an equivalent rate on the common stock of the American Cities Company of 1.5 per cent. The American Cities Company now owns in the aggregate 85.83 per cent of the preferred and 94.51 per cent of the common stock of the following companies: New Orleans Railway & Light Company, Birmingham Railway, Light & Power Company, Memphis Railway, Little Rock Railway & Electric Company, Knoxville Railway & Light Company and Houston Lighting & Power Company.

The combined comparative income statement for these constituent companies for the years ended Dec. 31, 1913 and 1912, follows:

	1913	1912
Gross earnings, all sources	$14,680,302	$13,878,961
Operating expenses and taxes	9,117,986	8,179,079
Net earnings	$5,562,316	$5,699,882
Interest, bond discount, amortization and miscellaneous	3,347,799	3,168,333
Amounts applicable to dividends on stocks	$2,214,517	$2,531,549

The gross earnings of the constituent companies increased at a rate of 5.8 per cent during 1913; the operating expenses and taxes, 11.4, and deductions, including interest charges, 5.6 per cent, leaving a decrease in net corporate income of 14.3 per cent. In commenting upon this showing, the report notes that during the year the Little Rock Railway & Electric Company reduced its electric light and power rates, the Birmingham Railway, Light & Power Company its gas and electric rates and the New Orleans Railway & Light Company its gas and electric rates. The increase in operating expenses and taxes was due largely to the increased percentage of operating revenue allowed for the maintenance of the constituent companies in addition to the sum which would have been derived from the increase in operating revenue. This aggregated $130,000, or approximately 1.6 per cent of the total operating expenses of the constituent companies. The taxes on the New Orleans Railway & Light Company, owing to a larger assessment, increased in an amount equal to 1.7 per cent of the total operating expenses and taxes. The operating expenses of the Houston Lighting & Power Company increased 0.75 per cent on account of greater cost of fuel oil. The operating ratios of the constituent companies for the last four years are as follows: 1910, 53.30; 1911, 52.23; 1912, 51.64, and 1913, 53.67.

Columbus Refunding Mortgage Approved

At a meeting of the stockholders of the Columbus Railway, Power & Light Company, Columbus, Ohio, on June 29, the issue of $25,000,000 of 6 per cent first refunding mortgage bonds and $3,595,000 of prior preferred stock, bearing 4 per cent cumulative dividends, was authorized. The outstanding bonds of the constituent companies will be refunded as they mature with the new bonds, while the new stock is to be exchanged for the Columbus Railway 4 per cent bonds. The bonds to be refunded follow: $425,000 of Central Market Street Railway 5's, $3,000,000 of Columbus Railway first 5's, $572,000 of Crosstown Street Railway first 5's, $450,000 of Columbus Electric Company first 6's and $300,000 of Columbus Edison Company first 5's. After refunding these bonds there would remain unissued $20,253,000 of first refunding bonds. The capital liabilities outstanding would then consist of the $4,747,000 of bonds used for refunding, $3,595,000 of prior preferred stock, $1,143,500 of preferred series A, $4,066,500 of preferred series B and $6,340,000 of common stock.

E. W. Strong, Cincinnati, attorney representing a group of stockholders, objected to the amount of the bond issue and to the prior preferred stock. S. G. McMeen, president of the company, explained the purpose in refunding the present underlying bonds of the company and in providing for financing extensions and improvements. Mr. Strong made a motion to limit the authorized bond issue to $10,000,000 instead of $25,000,000, but this was defeated. He then moved to postpone action on the bond issue until July 20. In this he was also defeated.

Atlanta & Carolina Railway, Atlanta, Ga.—Roland Ransom has been appointed receiver of the Atlanta & Carolina Railway by Judge J. T. Pendleton in the Fulton Superior Court at Atlanta. The company was organized to build an electric railway between Atlanta and Augusta, but after constructing a short stretch of road it suspended operation in 1910 when a petition was made for a receiver. The demurrer against this petition was sustained by the Superior Court and later by the Supreme Court. The petition for a receiver on which action has now been taken by the court was filed only recently.

Fort Wayne & Springfield Railway, Decatur, Ind.—The property of the Fort Wayne & Springfield Railway was offered for sale a third time on June 22 at Decatur under foreclosure, but no bids were received. The upset price of the property was fixed by the court at $200,000.

Interborough-Metropolitan Company, New York, N. Y.—The $1,500,000 of 6 per cent notes of the Interborough-Metropolitan Company which matured on June 22 were paid off with money derived from the 5 per cent extra dividends recently declared by the Interborough Rapid Transit Company. The $1,936,942 of 6 per cent collateral trust notes which matured on July 1 were paid off with the proceeds from the sale of $1,500,000 of 5 per cent refunding mortgage bonds of the Twenty-third Street Railway, together with $500,000 of interest charges in arrears on the bonds. There are no further maturities until July 1, 1915, when the $4,000,000 of five-year 6 per cent notes fall due.

Interstate Railways, Camden, N. J.—John A. Rigg, president, and Thomas W. Grookett, Jr., treasurer of the Interstate Railways, have filed in the Court of Chancery of Trenton, N. J., an answer to the suit of Caleb F. Fox, a stockholder. Mr. Fox asked the court to restrain the defendants from paying to the company's bondholders such sums as the bondholders might have paid in release of certain bonds deposited with the Philadelphia Trust, Safe Deposit & Insurance Company. The answer of the defendants admits that the company was in a precarious financial condition in 1909. In June of that year $7,000,000 of bonds was deposited with the Philadelphia Trust, Safe Deposit & Insurance Company, as a depository for E. B. Smith & Company, Philadelphia, and a bondholders' committee, which was seeking to rehabilitate the company financially. It is further set out that the negotiations between Smith & Company and the bondholders' committee were abandoned on May 13, 1909. It is denied by the company that the Carson Estate controls the directorate of the defendant company. It is also denied that the rentals now received from the various properties of the company are insufficient to redeem and cancel certain preferred stock and to pay interest charges against the company, if the bondholders are compensated by the company for the payments which they made to secure the release of their securities. It is asserted that the Interstate Railways is now on a sound financial basis and that the efforts of the bondholders in 1909 have inured to the benefit of the complainant and the corporation.

Manchester Traction, Light & Power Company, Manchester, N. H.—The New Hampshire Public Service Commission has authorized the acquisition by the Manchester Traction, Light & Power Company of a controlling interest in the Nashua Light, Heat & Power Company. A transmission line will be built between the hydroelectric plants of the former and the steam plant of the latter, which are about 25 miles apart.

Marion, Bluffton & Eastern Traction Company, Bluffton, Ind.—The Marion & Bluffton Traction Company, the successor to the Marion, Bluffton & Eastern Traction Company, elected the following officers at a meeting of the directors on June 17, 1914: James W. Sale, president; Abram Simmons, vice-president; W. A. Patton, secretary and general manager; Dell Locke, treasurer. The following appointments have been made: James S. Clark, auditor, and George A. Redd, superintendent of transportation.

Minneapolis & Northern Railway, Minneapolis, Minn.—On petitions by George Heaton, president of the company, and of the Pittsburgh Coal Company, the Minneapolis & Northern Railway has been placed in the hands of the Minnesota Loan & Trust Company as receiver. On Jan. 26 five railroad contractors took over the line on liens amounting to $74,000, but the company was given a year in which to redeem the claims. The contractors, L. H. Boldue & Company, Leach & Mahoney, Belch & Company, Coolidge & Company and the Central Warehouse Lumber Company organized a separate company to extend the line to Mille Lacs, and this company, the Minneapolis, Mille Lacs & Northern Railway, will not be affected by the receivership.

Minster & Loramie Railway, Loramie, Ohio.—The Minster & Loramie Railway has been authorized to issue its common capital stock of the total par value of $42,700, and its new first mortgage 6 per cent bonds of the total sum of $20,000. The bonds are to be sold for the highest price obtainable, but for not less than 85. The common stock is to be issued in full exchange for the company's present outstanding issue of first mortgage bonds, of the total principal sum of $42,700. The proceeds arising from the sale of the new first mortgage bonds are to be devoted to pay and discharge present floating indebtedness.

New York, New Haven & Hartford Railroad, New Haven, Conn.—The directors of the New York, New Haven & Hartford Railroad and subsidiaries held meetings on June 25. Dividends were passed by the Rhode Island Company, by the Ontario & Western, and by the Housatonic Power Company. The official statement regarding the Rhode Island Company says: "No meeting of the Rhode Island Company board was held because it was deemed unwise to declare a dividend for that property. This has been a poor year for this property, which earned about 3 per cent on its stock, compared with 6 per cent a year ago. The difference is made up almost entirely from increase in wages and heavy expenses due to rebuilding the power house at Providence. This company, like the Connecticut Company, has a separate board of directors and officers with headquarters at Providence and is perfecting its operation."

Ontario West Shore Railway, Goderich, Ont.—The municipalities interested in the construction of the Ontario West Shore Railway have decided to advertise the road for sale by tender, on the understanding that the successful bidder, if any, shall complete the road from Goderich to Kincardine. In the event of the road not being sold as a whole the ties, bridge timber and other material will be sold separately.

Phillipsburg (N. J.) Horse Car Company.—The Phillipsburg Horse Car Company has certified to an increase in its capital stock from $30,000 to $430,000.

Public Service Corporation, Newark, N. J.—The Board of Public Utility Commissioners of New Jersey has authorized the Public Service Railway to extend for thirty years at 5 per cent the $300,000 of 6 per cent second general mortgage bonds of the Paterson Railway, which mature on Oct. 1, 1914.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—M. A. Andersen has filed a protest with the Railroad Commission of California against granting the application of the San Francisco-Oakland Terminal Railways for an order authorizing the issuance of bonds. Mr. Andersen is the owner of $62,000 of 5 per cent fifty-year sinking fund gold bond certificates of the United Properties Company. He alleges that these bond certificates were acquired in lieu of 5 per cent fifty-year sinking fund gold bonds of the United Properties Company, which it was represented were in course of preparation and would be delivered to the owners and holders of the certificates as soon as the bonds could be made ready. The United Properties Company, the complaint states, owned, at the time of issuing these certificates, a majority of the capital stock of the San Francisco-Oakland Terminal Railways, and it was agreed between the United Properties Company and the holders of the certificates that no prior lien would be placed upon this property. Subsequently, Mr. Andersen states, the United Properties Company, without his consent, transferred to others the stock of the San Francisco-Oakland Terminal Railways. The present holders of this stock are now seeking to issue bonds and Mr. Andersen is trying to prevent this action on the ground that it will cloud his title to an equitable first lien upon the properties of the United Properties Company.

United Railroads, San Francisco, Cal.—The annual meeting of the stockholders of the United Railroads has been called for July 14. At this meeting, which will be held three days before the date set for the inquiry into the affairs of the company by the State Railroad Commission, directors and officers will be elected for the ensuing year. Proxies have been forwarded to Jesse W. Lilienthal, president of the company, by Mason B. Starring, president of the California Railway & Power Company, the holding company of the United Railroads. In his letter to Mr. Lilienthal, Mr. Starring refers to the proposed inquiry into the affairs of the company by the Railroad Commission. He concludes his letter to Mr. Lilienthal as follows: "At this time I know of nothing more such stockholders can do than to send you proxies to be voted by you and with which you can establish yourself and your board in office for the ensuing year and further establish such policies for the United Railroads as in your judgment and others are best calculated to serve all interests."

Washington (D. C.) Interurban Railway.—Guy T. Scott and T. Howard Duckett have been appointed temporary receivers for the Washington Interurban Railway. Suit for the appointment of receivers was brought by the Railway Storage Battery Car Company on a promissory note for $15,957, on which judgment for $18,350 was confessed.

Youngstown & Ohio River Railroad, Leetonia, Ohio.—A quarterly dividend of 1 per cent has been paid on the $1,000,000 of 5 per cent preferred stock of the Youngstown & Ohio River Railroad. The dividends on this stock have been cumulative from July 1, 1903. Three-fourths of 1 per cent was paid on March 25 last, 1 per cent on Dec. 31 last, 1¼ per cent on Sept. 30, three-quarters of 1 per cent in June and March, 1913, and 1⅛ per cent, quarterly, in 1912.

Dividends Declared

Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., quarterly, 1½ per cent, preferred.

Bay State Street Railway, Boston, Mass., 3 per cent, first preferred; 2¼ per cent, common.

Birmingham Railway, Light & Power Company, Birmingham, Ala., 3 per cent, common and preferred.

Boston & Suburban Electric Companies, Newtonville, Mass., $1, preferred.

Chicago (Ill.) City Railway, quarterly, 2½ per cent.

Chippewa Valley Railway, Light & Power Company, Eau Claire, Wis., quarterly, 2 per cent, common.

The Citizens' Traction Company, Oil City, Pa., $1.25, preferred.

City Railway, Dayton, Ohio, quarterly, 1½ per cent, preferred; quarterly, 2 per cent, common.

Columbus, Newark & Zanesville Electric Railway, Cincinnati, Ohio, quarterly, 1½ per cent, preferred.

Consolidated Cities Light, Power & Traction Company, New York, N. Y., quarterly, three-quarters of 1 per cent.

International Traction Company, Buffalo, N. Y., 2 per cent, preferred (No. 4).

Manchester Traction, Light & Power Company, Manchester, N. H., quarterly, 2 per cent.

Monongahela Valley Traction Company, Fairmont, W. Va., 1½ per cent, common.

Montreal (Que.) Tramways, quarterly, 2½ per cent.

Nashville Railway & Light Company, Nashville, Tenn., quarterly, 1¼ per cent, preferred.

New England Investment & Security Company, Springfield, Mass., $2, preferred.

Porto Rico Railways, Ltd., quarterly, 1¾ per cent, preferred; quarterly, 1 per cent, common.

Public Service Investment Company, quarterly, $1.50, preferred; $2, common.

Springfield & Xenia Railway, Springfield, Ohio, quarterly, 1½ per cent, preferred.

United Railways & Electric Company, Baltimore, Md., quarterly, 50 cents, common.

Western New York & Pennsylvania Traction Company, Olean, N. Y., 3 per cent, first preferred.

West Penn Railways, Pittsburgh, Pa., quarterly, 1¼ per cent, preferred.

Youngstown & Ohio River Railroad, Leetonia, Ohio, quarterly, 1 per cent, preferred.

Traffic and Transportation

Toronto Company Replies to Traffic Recommendations

H. S. Osler appeared before the Ontario Railway Board on June 26 for the Toronto (Ont.) Railway in connection with the recommendations of C. R. Barnes, the board's traffic expert. As noted in the ELECTRIC RAILWAY JOURNAL of June 20, page 1419, Mr. Barnes recommended that the company extend the Teraulay line north from Agnes to College Street, to be completed by Nov. 1, in order that the College cars may be taken off Yonge Street. He also suggested that the Bloor line be extended from Lansdowne Avenue to High Park. Mr. Osler contended in the latter instance that the work proposed was outside the limits covered in the franchise agreement of 1891. The company agreed to rearrange the layout at Broadview and Gerrard immediately. R. J. Fleming, general manager of the company, contended that it would be impossible to lengthen the platforms and lower the steps of the 202 old double-truck cars. Chairman McIntyre of the board held that at least 164 could be so reconstructed. Mr. Fleming finally agreed to rebuild thirty-four of the cars before Aug. 15, and to report on the others thereafter. The company consented to continue its custom of the last four or five years and equip new cars with push buttons at the time they are built. The company agreed to install an adequate private telephone system and to report before Oct. 1 on the recommendation for a change in the method of heating the cars. A number of regulations to promote safety and minimize blocking of the aisles were agreed upon. All the cars will be equipped with proper illuminated route signs, front and right side, during the next ten months.

Near-Side Stop Advocated in Cleveland.—Director of Public Safety Benesch of Cleveland is advocating a change to the near-side stop by the Cleveland Railway.

Fast Freight and Express Service.—H. W. Clapp, general superintendent of the Columbus Railway, Light & Power Company, has announced the establishment of a fast freight and package service between Columbus and Westerville by the company. Cars will make two round trips a day.

Accident on Lake Shore Electric Railway.—More than thirty persons were injured, some perhaps fatally, on June 22, when an eastbound limited car on the Lake Shore Electric Railway, Cleveland, Ohio, collided with a work train standing on a siding near Sandusky. Few of the passengers escaped superficial injuries.

Tacoma Company to Restore Transfer Privileges.—The Tacoma Railway & Power Company, Tacoma, Wash., has announced that it will restore transfer privileges which were recently withdrawn, on the understanding that an ordinance will be passed by the city protecting the company against the misuse of the slips.

Monthly Accident Reports Requested.—The Illinois Public Utilities Commission has requested all electric railways and other public utilities in the State to furnish sworn statements of all accidents the first of each month. Fifty per cent of all railroad accidents in Illinois are attributed to trespassing, and the commission is anxious to take action to eliminate such accidents.

Cincinnati Suburban Company Answers Complaint.—The Interurban Railway & Terminal Company, Cincinnati, Ohio, has filed with the Public Utilities Commission a denial of the complaints made against it by City Solicitor Walter Schoenle of Cincinnati. The company says that extra trains have always been used when they were needed and that this custom will be continued. It denies that it is the only line furnishing service to the district through which it passes.

Indianapolis-Louisville Service.—Frank Smith, the vice-president of the Interstate Public Service Company, which owns and operates the lines between Louisville and Indianapolis, has discussed with John Telford, of the transportation committee of the Board of Trade of Louisville, and other members of that organization the lack of depot facilities of which the Louisville shippers complain. It is understood that the order of the Interstate Commerce Commission in regard to through rates between the cities will be obeyed soon.

Crop Prospects Near Louisville.—By improved methods of packing freight in its cars the Louisville & Interurban Railway, Louisville, Ky., has been able to take care of a largely increased freight business on its country lines without the addition of equipment. Freight business of the lines out of Louisville has increased rapidly in the last year or so. This season the prospects for tremendous crops of raspberries and blackberries are the best ever and should yield much freight for the Louisville & Interurban Railway as well as for the Insull lines across the river.

Near-Side Ordinance in New York.—The Aldermen of New York on June 30 passed the ordinance requiring surface cars to stop on the near side of streets. At present cars stop on the near side where there are intersecting car lines and at "fire stop" and "school stop" streets. The ordinance says that cars must stop at the near side of all streets "except that in unusual cases, where considerations of safety or convenience so demand, the Police Commissioner may authorize variations from the rule." In such cases "trolley stop" signs will be displayed. If the Mayor signs the ordinance it will take effect on Sept. 1.

More Double-Deck Cars in Pittsburgh.—Pittsburgh now has six double-deck street cars. Two additional cars of this type were put into service on June 20 by the Pittsburgh Railways. They are equipped with the safety device invented and patented by P. N. Jones, general manager of the company, which short-circuits the motors through resistance and insures the immediate stoppage of the car. There is no failure of the safety device even if the trolley is off the wire and the hand brakes and air-brake apparatus are disabled. The seating capacity of each car is 110.

Through Rate Hearing in Peoria.—Acting upon a complaint of the Chicago, Ottawa & Peoria Railway, Ottawa, Ill., the Interstate Commerce Commission will hold a hearing in Peoria on July 14 to determine whether or not through freight rates between electric and steam railroads shall be adopted. F. E. Fisher, general superintendent of the company, argues that the lack of interchange rates has been productive of losses to the interurban lines. He cites instances where steam roads have declined to make a through rate for merchandise originating on the electric railway.

Canadian Post-office Act Amended.—By the terms of an amendment to the Canadian post-office act passed by the House of Commons at Ottawa on May 4 and by the Senate on June 4, the postmaster-general has been empowered to fix the rate at which an electric railway operating in Canada shall carry letter carriers on the cars. As the bill passed the House the postmaster-general was authorized to fix the rate without redress on the part of the company. The Senate, however, inserted a clause making it possible for a company to appeal to the Railway Commission for redress in the event of a dispute arising.

Another Toronto Civic Line Fare Proposal.—Works Commissioner Harris, of Toronto, Ont., reported to the Board of Control on June 25 that the interchange of traffic between the Toronto Railway and the Civic Car lines would probably increase the receipts of the latter $6002 a year and reduce the annual deficit from $205,842 to $199,839. This is on a basis of 5 cents for a fare with transfer privileges and 3⅛ cents for a local fare. The Comptrollers reserved consideration. Mayor Hocken remarked that the scheme did not look financially worth while, in comparison with Comptroller O'Neill's proposal to fix a flat local fare of 2½ cents a ride.

Increase in Pay on South Carolina Road.—The following announcement was made recently by the Greenville, Spartanburg & Anderson Railway, Greenville, S. C.: "Beginning July 1 the pay of the motormen and conductors will be increased from 12½ cents an hour for the first year to 15 cents an hour and the years of service will be rewarded by increase of pay to 1 cent an hour for each year of service until 20 cents an hour is reached. The minimum day rate will be increased from $1 to $1.20. It is with pleasure that we are giving this increase and take this opportunity of expressing our appreciation of the faithful service of the motormen and conductors."

Albany Traffic Recommendations Forwarded to Company.—The Public Service Commission of the Second District of New York has forwarded to the United Traction Company, Albany, the report of Charles R. Barnes, electric railway inspector of the commission, and has notified the company that it must file its answer to the recommendations made by Mr. Barnes on or before July 7. No action by the commission in regard to hearings on the report will be taken until after the reply of the company has been received. The recommendations contained in the report of Mr. Barnes were published in the ELECTRIC RAILWAY JOURNAL of June 27, 1914, page 1478.

Mail and Express Franchise in Salt Lake City.—The amended ordinance granting the Utah Light & Railway Company, Salt Lake City, Utah, a franchise to haul mail and express matter over its interurban lines and into the city along West Temple Street has been passed by the City Commission. The provision to allow carload freight hauling was stricken out. Perhaps the principal provision inserted in the franchise before it passed was the one prohibiting the company from operating its mail and express cars in trains. The franchise runs until 1955, when all the other Utah Light & Railway Company franchises expire. The company agrees to pay the city $25 a year for each car used in transporting mail or express.

Through Express Service Between Worcester and Providence.—Arrangements have been made for the operation of through electric railway express service between Worcester, Mass., and Providence, R. I., over the Worcester Consolidated Street Railway, the Rhode Island Company and connecting lines. The plan is to have the through cars leave Providence on Monday, Wednesday and Friday afternoons at 3.30, arriving in Worcester at about midnight. The goods will be ready for delivery at 6 o'clock the next morning. The cars for Providence will leave Worcester Tuesday, Thursday and Saturday afternoons at 4.30, and the merchandise will be ready for delivery in Providence at 7.30 in the morning. Going each way the cars will take on merchandise only at Milford.

Suspension of Schedule Order in Washington.—The Public Utilities Commission of the District of Columbia and the Interstate Commerce Commission have granted the applications of the Capital Traction Company and the Washington Railway & Electric Company for the suspension of orders relating to schedules on their lines from July 1, 1914, to Sept. 15, 1914. A written statement from each company was filed with the district commission, agreeing that, if the service provided on any line between the dates mentioned during the periods of the day covered by the suspended orders was not sufficient in the opinion of the commission, the service on that line would be increased without the necessity of a formal hearing or the issuing of an order by the commission.

Protest Against Abandonment of Service.—Citizens of Jackson County have filed with the Public Utilities Commission a protest against the suspension of operation of electric cars on what is known as the Jackson and Hamden belt line, owned by the Hocking Valley Railroad, Columbus, Ohio. The cars were operated by electricity, and a number of towns and individuals were furnished current for lighting. The line is 17 miles long. According to the company the line is unprofitable and the track will soon have to be reconstructed. The company expects to operate steam trains over the road. The complaint states that several hundred miners use the electric cars daily and that it would be impossible for them to travel to and from their work conveniently on a steam road schedule.

Service Complaint Closed.—The Public Service Commission of the Second District of New York has closed upon its records the complaint of residents of Aqueduct against Schenectady Railway as to service rendered the public, the railway company having agreed that a shop car will be put on immediately, running from Aqueduct to the General Electric Company's works in the morning and returning in the evening; that the waiting room at Aqueduct will immediately be repaired and lighted and kept in a proper condition. Certain of the cars operated between Aqueduct and Schenectady have already been overhauled, and the company further agrees to make other improvements in the character of the cars and the time schedules before October next.

New York Subway Advertising Contract.—George F. Hurd, counsel for the Auto Sales Gum & Chocolate Company, has notified the Public Service Commission for the First District that his clients will not make any offer for the newsstand and advertising privileges on the new rapid transit lines on the conditions recommended to the Public Service Commission for the First District by the Interborough Rapid Transit Company. That company has made a new contract with Artemus Ward, formerly Ward & Gow, for these privileges, and this contract is now pending before the commission for approval. The Interborough Company has also submitted to the commission certain conditions which it would impose if the privileges are put up for public bidding. The commission as yet has not taken final action on the contract.

New Transfers in St. Louis.—The United Railways, St. Louis, Mo., arranged beginning July 1 to issue transfers in accordance with the conditions mentioned in the ELECTRIC RAILWAY JOURNAL of May 9, 1914, page 1061. The new transfers are double in form. The conductor to whom the first fare is paid issues the transfer, punching crosstown lines and the line to carry the passenger to his destination. The conductor of the intersecting line takes up the original or first transfer and the conductor of the last line to be used takes up the second half or duplicate transfer. On the duplicate transfer is printed: "This transfer, issued under rules of company and decree of Circuit Court, good only at intersections punched within time and direction punched; not accepted unless properly punched; not good for round trip; not transferable to another."

Smoking Question in Louisville.—The matter of smoking on the cars of the Louisville & Interurban Railroad is before the patrons of the line and the representatives of the company. In seasons past the conductors have permitted the no-smoking rule to become inoperative so far as it applied to the open trailers which are attached to several of the early morning cars to bring the business men into town. A car that reached the city at 8 o'clock carries a trailer. Both motor and trailer are occupied mostly by men. For the last season or so the men have been permitted to finish their after breakfast cigars on the cars. Lately the no-smoke order has been enforced by the conductors. Smokers protested in vain to the conductors and at length the men selected a committee which arranged to wait on Samuel Riddle, superintendent of the company. The patrons of the train in question are asking that a few seats at the rear of the trailer be set aside for smokers as is done in the open cars on the city system. Only the cars used on the Lagrange division of the company's lines are equipped with a smoking compartment. What in other localities is the smoking compartment of trolley lines constitutes the "Jim Crow" section of the cars of the Louisville & Interurban system.

Front-End Collection System Modified.—A successful variation of the front-end collecting system has been used by the Metropolitan Street Railway at Electric Park, Kansas City's chief summer resort in the southeast section of the city. Much difficulty formerly was encountered by the company in collecting from all passengers during the rush hours at the park, as well as in handling the crowds expeditiously. Automatic turnstiles have been installed at the park exits, two conductors being stationed there. All persons leaving the park desiring to ride into the city pass through the gates, the number being automatically recorded. The men at the gates must show 5 cents for each person using the stiles. One man collects fares, while the other distributes transfers, on which only the hour is punched. Passengers then board any car they wish, entering by either the front or rear doors. As soon as the car is filled it moves on, the conductor collecting or punching the transfers held by the passengers at his leisure, and not as the passengers enter. In the past many persons riding to the park have remained on the cars, the conductors being unable to collect the return fare by reason of inability to identify the passenger. Anyone not holding a transfer received at the park exit must now pay the conductor.

Personal Mention

Mr. A. K. Bodholdt, for years one of the trial attorneys of the Chicago (Ill.) City Railway, has been appointed assistant secretary of the Central Trust Company of Illinois, Chicago.

Mr. Frank J. Duffy, president and manager of the Southern Railway & Light Company, Natchez, Miss., has been elected president of the Natchez Chamber of Commerce, the leading commercial organization of the city.

Mr. B. W. Lynch, formerly general auditor of the Consumers Power Company of Minnesota, has been appointed assistant to the general auditor of H. M. Byllesby & Company to succeed Mr. N. P. Zech, resigned.

Mr. H. T. Willett has resigned as secretary of the Springfield (Ill.) Consolidated Railway and the Springfield Gas & Electric Company on account of ill health. Mr. Willett has been with the companies for seven years.

Mr. Charles Walsh, who has been assistant to the chief auditor of Hodenpyl, Hardy & Company, New York, N. Y., has been appointed secretary of the Springfield (Ill.) Consolidated Railway and of the Springfield Gas & Electric Company.

Mr. J. H. Hickey, formerly purchasing agent of the Buffalo, Lockport & Rochester Railway, with headquarters at Rochester, N. Y., has been appointed assistant purchasing agent of the Empire United Railways, Inc., with headquarters at Syracuse, N. Y.

Mr. J. C. Stone has been appointed assistant traffic manager of the Northern Electric Railway, Sacramento, Cal., to serve under Mr. J. R. Wilson, traffic manager of the company. Mr. Stone was formerly connected with the Southern Pacific Company as district freight and passenger agent at Sacramento, and afterward was chief clerk to the general freight agent of that company located at San Francisco.

Mr. George Kuhn, who has been appointed master mechanic of the International Railway, Buffalo, N. Y., entered business with the Buffalo Street Railroad in 1883. He was subsequently appointed to take charge of the wood-working department and later was placed in charge of the truck and motor department. Since then he has served in turn as carhouse foreman, general foreman in the shops and carhouses and assistant master mechanic.

Mr. W. H. Sawyer has resigned as engineer in charge of the New York office of Ford, Bacon & Davis, New York, N. Y., to become connected with the E. W. Clark & Company Management Corporation as vice-president, with headquarters at Columbus, Ohio. Mr. Sawyer was born forty years ago at Schoolcraft, Mich., and was graduated from the University of Nebraska in 1894 with the degree of B.S. For two years after graduation he was with several street railway companies. Subsequently he entered the employ of the railway and engineering departments of the General Electric Company, with which he continued for nine years. He next entered the employ of Ford, Bacon & Davis, with whom he has been connected for nine years. On June 26 Mr. Sawyer was tendered a farewell dinner at the Railroad Club of New York by the members of the Deportation Club. Mr. Sawyer was one of the charter members of this society and took an active part in its functions. Mr. Frank Hedley, vice-president of the Interborough Rapid Transit Company, acted as toastmaster at the affair on June 26 and in behalf of those in attendance presented Mr. Sawyer with a large silver loving cup.

W. H. Sawyer

Mr. W. L. Davis, formerly assistant secretary and assistant treasurer of the Texas Power & Light Company and affiliated companies, was recently appointed superintendent of accounts of the Strickland-Goodwin Management Association, of Dallas, Tex., succeeding Mr. J. R. Wolfe, assigned to other duties.

Mr. R. F. Kelker, Jr., has been appointed traction expert in charge of the traction bureau of Chicago's department of public service. Mr. Kelker resigned his position as assistant to the district engineer of the Central District, Division of Valuation, Interstate Commerce Commission, Chicago, to take up his new work. Prior to accepting the Government position he was principal assistant engineer to Mr. George Weston, engineer of the Board of Supervising Engineers, Chicago Traction.

Mr. J. R. Wilson, who has been appointed traffic manager of the Northern Electric Railway, Sacramento, Cal., began his railway career in the local freight office of the Southern Pacific Company at El Paso, Tex., twelve years ago. After serving for a year at El Paso he was transferred to the general freight office of the Southern Pacific Company at San Francisco where he was employed for two years. He resigned from the Southern Pacific Company to become connected with the San Francisco agency of the Illinois Central Railroad as traveling freight and passenger agent in the San Joaquin and the Sacramento Valleys. Three years ago he was appointed commercial agent of the Illinois Central Railroad at San Francisco, in which capacity he continued until his recent appointment as traffic manager of the Northern Electric Railway. Mr. Wilson succeeds Mr. S. W. Russell with the Northern Electric Railway.

OBITUARY

Herman Porter Kimball, who for nearly twelve years was associated with the New York office of the Standard Underground Cable Company, Pittsburgh, Pa., died on June 24 at New Rochelle, N. Y. He was forty-eight years old. Mr. Kimball was born in Fitchburg, Mass. For six years prior to his connection with the Standard Underground Cable Company he was engaged in electrical engineering.

Redick M. Ridgely, superintendent of the Springfield (Ill.) Consolidated Railway from 1876 to 1899, died at his home in that city June 23, at the age of eighty-four years. Mr. Ridgely had resided in Springfield since a boy and had been prominent in business and politics there for a half-century. He was postmaster at one time and a member of the State Legislature.

New Plan to Control Railroad Securities

On June 26 Louis D. Brandeis, Boston, and George Rublee, New York, laid before the Senate interstate commerce committee a new suggestion for the control of railroad security issues. The suggestion is proposed in place of portions of the House railroad capitalization bill now before the Senate committee and provides in brief that after Jan. 1 next no common carrier will be allowed to acquire any interest in any property or be permitted to issue any securities or assume any obligations except for purposes of construction, improvement or betterment of facilities of its railroad or "some railroad, boat line or car line" which it lawfully owns or operates; or for refunding lawfully issued securities, or for the reimbursement of the treasury of the company for any lawful expenditures, or for the acquisition of any transportation line authorized by the Interstate Commerce Commission or for some purpose approved by the commission where the expenditure involved "will not impair the capacity of the carrier to perform its public duty." Another feature provides that no carrier shall be allowed after the passage of the act to acquire, lease or purchase any interest in the railroad, boat line or electric railway unless authorized by the commission after a hearing.

On June 30, H. P. Thom, general counsel for the Southern Railway, offered an amendment to the House bill creating a bureau of credits and securities under the commission to be appointed for six years to examine and determine questions of security issues. A report of this bureau in such cases would become the order of the commission five days after made unless the commission ordered a hearing.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***North & South Railway, Wichita, Kan.**—Incorporated in Kansas to build an electric railway between Wichita, Concordia and Washington, Kan., a distance of about 200 miles.

***Ephrata & Lebanon Street Railway, Lebanon, Pa.**—Chartered in Pennsylvania to build an electric railway between Lebanon and Ephrata. This company is separate from the other companies chartered to build lines in this section. Capital stock, $34,000. Incorporators: C. O. Collett, C. D. Siegle, Charles D. Lawrence, Henry O. Evans and E. T. Noble.

***Philippi & Clarksburg Traction Company, Philippi, W. Va.**—Incorporated in West Virginia to build an electric railway from Philippi to Clarksburg. Capital stock, $25,000. Incorporators: Samuel V. Woods, J. H. Woods, R. E. Talbott, Henry H. Byrer, J. C. Watson and E. R. Dyer, all of Philippi, W. Va.

FRANCHISES

***Springfield, Ill.**—The Illinois Public Utilities Commission has issued a certificate of convenience and necessity to the Murphysboro & Southern Illinois Railway, which plans to build a 7-mile electric railway from Murphysboro to Carbondale. A. B. Minton, Murphysboro, is interested.

Cedar Rapids, Ia.—The Iowa Railway & Light Company has received a twenty-five-year franchise from the Council to extend some of its lines in Cedar Rapids.

Alexandria, La.—The Alexandria Electric Railways has asked the Council for a franchise to extend some of its lines in Alexandria to the city limits.

Kansas City, Mo.—An ordinance ordering the rerouting of the Minnesota-Indiana line of the Metropolitan Street Railway, Kansas City, has been passed by the City Council. The measure requires that the cars traverse Eighteenth Street as far west as Prospect Avenue north to Fifteenth and west to Main.

Portland, Ore.—Because it has been found that a portion of East Twenty-ninth Street on the course of the proposed crosstown street car line on the east side is not dedicated as a street, the Portland Railway, Light & Power Company has refused to accept the crosstown franchise granted two months ago by the City Council. The company through President Griffith will now ask for a new franchise for the crosstown line over East Thirtieth Street to Hawthorne Avenue, eliminating East Twenty-ninth Street from the route.

Providence, R. I.—The Rhode Island Company has received a franchise on Mount Pleasant Avenue, from Chalkstone Avenue to Atwell's Avenue in Providence.

Nashville, Tenn.—The Nashville Traction Company has asked the Council for a franchise in Nashville. W. O. Palmer, Nashville, president. [E. R. J., May 9, '14.]

East Dallas, Tex.—Daniel Sonnentheil and associates have asked the Council for a fifty-year franchise to build an electric line in East Dallas, to cross Lakewood addition. Several months ago another franchise was asked, but was withdrawn, the petitioners deciding that another route would be best. This proposed line will extend over Tremont, Ridgeway, Worth and Paulus streets to Junius and the Greenville road through the Belmont addition to the line of the Texas Traction Company.

Galveston, Tex.—The Galveston Electric Company has asked the Council for a franchise to extend the Avenue H line to the boulevard and to build several other short extensions in Galveston.

Port Arthur, Tex.—The Pier Railway has asked the Council for a franchise to build an electric line from the center of the city to the pleasure piers in Port Arthur. K. M. Smith, Port Arthur, is interested. [E. R. J., June 20, '14.]

TRACK AND ROADWAY

Lethbridge (Alta.) Municipal Tramway.—A by-law is being advertised at Lethbridge which includes a clause to provide $13,153 for municipal electric railway extensions in Lethbridge.

***Benicia, Cal.**—Surveys have been completed and construction will soon be begun on the proposed electric line between Vallejo and Benicia. This line will enter Vallejo near the North Vallejo depot and will have its terminus at the Monticello Steamship Company. This line will be extended north from Benicia and it is believed that it is to be a part of some other railway system, possibly the Oakland, Antioch & Eastern Railroad. J. R. Cunnyngham, Benicia, is interested.

Point Loma Railroad, San Diego, Cal.—Within the next few weeks this company plans to begin work on the extension of the Ocean Beach and Point Loma line to the wireless station and to the government line at La Playa.

San Francisco (Cal.) Municipal Railway.—Work has been begun by F. Rolandi on the construction of this municipal line on Stockton Street in San Francisco.

St. Petersburg & Gulf Railway, St. Petersburg, Fla.—Two loop extensions will be built at once by this company in St. Petersburg. Contracts have been awarded by this company to build extensions of its tracks to connect its North Ninth Street line and the Coffee Pot loop line in St. Petersburg.

Washington & Lincolnton Railroad, Lincolnton, Ga.—Surveys have been completed and arrangements are being made to begin grading at once on this 25-mile line to connect Washington and Lincolnton. The following officers have been elected: J. R. Dyson, president; H. W. Quin, secretary; E. A. Barnett, M. P. Pope and M. A. Pharr, directors. [E. R. J., June 6, '14.]

***Murphysboro & Southern Illinois Railway, Murphysboro, Ill.**—Right-of-way is being obtained by this company for its 7-mile electric line between Murphysboro and Carbondale. Among those interested are: A. B. Minton, Murphysboro; Charles H. Clay and Edward Flad.

La Salle County Electric Railroad, Ottawa, Ill.—Surveys have been completed between Ottawa and Mendota, 28 miles, grading has been completed between Ottawa and Prairie Center, 14 miles, and grading is now in progress from Prairie Center to Mendota, 14 miles. This 28-mile line will connect Ottawa, Prairie Center, Triumph and Mendota. [E. R. J., June 20, '14.]

Fort Wayne & Northwestern Railroad, Fort Wayne, Ind.—This company is asked to consider plans to build a 5-mile extension from Kendallville to Rome City.

Marion & Bluffton Traction Company, Indianapolis, Ind.—This company, formerly the Marion, Bluffton & Eastern Traction Company, has been recently organized and has elected the following officers: James W. Sale, president; Abram Simmons, vice-president; Dell Locke, treasurer, and W. A. Patton, secretary and general manager. [E. R. J., June 13, '14.]

Waterloo, Cedar Falls & Northern Railway, Waterloo, Ia.—The extension south to Center Point has been placed in operation by this company. The extension from Center Point to Cedar Rapids will be completed before the end of the year.

Independence, Neodesha & Topeka Traction Company, Independence, Kan.—Petitions are being circulated at Neodesha, Kan., calling for an early election to vote bonds to the extent of $10,000 to this company, which proposes to build an electric line from Neodesha to Independence. T. J. Booth, president. [E. R. J., April 18, '14.]

Joplin & Pittsburg Railway, Pittsburg, Kan.—This company contemplates extending its tracks in Joplin, Mo. Business men of the city have offered a bonus for extensions to Parkview and to Fairview cemetery. Universal transfers also are proposed in order to give access to Schifferdecker Park. William A. Satterlee, Pittsburg, Kan., general manager.

Topeka (Kan.) Railway.—This company has placed in operation its line to Gage Park.

Fort Fairfield, Maine.—At a recent meeting of the Board of Trade of Fort Fairfield plans were considered to build an electric railway in Fort Fairfield and extend it to Limestone, Caribou, Caswell and other points. Eben S. Hopkins, Fort Fairfield, is interested. [E. R. J., June 13, '14.]

United Railways & Electric Company, Baltimore, Md.—This company has been ordered by the Public Service Commission of the State of Maryland to extend its Belair road line from Overlea, its present terminus, to Neckar, a distance of 3 miles.

Worcester (Mass.) Consolidated Street Railway.—This company is asked to consider plans to build a 1-mile extension from June Street and Chandler Street to Park Avenue and Chandler Street in Worcester.

Hattiesburg (Miss.) Traction Company.—This company is asked to extend its lines to the Woman's College in Hattiesburg.

***Brookfield, Mo.**—Plans are being considered to build an electric railway to connect Brookfield, Marceline, Wien, Bynumville, Prairie Hill, Clifton Hill, Randolph Springs, Huntsville and Moberly. No names are yet given of those interested in the project.

***Columbia, Mo.**—F. S. Mordaunt, Chicago, W. J. Delaney, Frank Kidd and J. N. Trescott, St. Louis, contemplate building an electric railway in Columbia and extend it to an amusement park which they propose to build.

Stone Harbor (N. J.) Terminal Railroad.—This company has completed the electrification of its line between Cape May Court House and Stone Harbor. The new central power plant of the Electric Light & Power Company at Cape May Court House furnishes power for the Stone Harbor Terminal Railroad. Plans are being discussed for an electric line to run the entire length of Seven-Mile Beach, crossing Hereford Inlet by bridge and connecting with the Wildwood electric line at Anglesea.

Schenectady (N. Y.) Railway.—Plans are being prepared by this company for extensions to the Grand Boulevard section, Carman and South Schenectady. Applications will soon be made to the Council for franchises.

Wilmington-Carolina Beach Railway, Wilmington, N. C.—Plans are being formulated by this company to build a 15-mile electric line to connect Wilmington, Carolina and Wilmington beaches. George F. Meares, Wilmington, is interested. [E. R. J., April 12, '13.]

Cleveland & Youngstown Railway, Columbus, Ohio.—Work has been begun on the line which is to extend from the downtown section of Cleveland through Kingsbury Run Valley to Shaker Lakes.

***Windsor, Ont.**—On June 9 the City Council of Windsor voted to ask the Ontario Hydro-Electric Commission to report on cost of construction, equipment and operation of electric railways to begin at a point in Sandwich West, and connect by one or more routes Sandwich. Windsor, Walkerville, Ford City, Sandwich East, and Maidstone, and villages of St. Claire and Belle River.

***Dallas, Tex.**—J. R. Babcock, secretary of the Chamber of Commerce, Dallas, A. M. Matson and J. A. Kemp, Wichita Falls, are considering plans to build an electric railway from Dallas to Wichita Falls, via Denton, about 125 miles.

Uniontown (Pa.) Radial Street Railway.—This company, which plans to build an electric line between Uniontown and Connellsville, via Oliver, has completed the section of the line between Connellsville and Oliver and will begin work on the line between Oliver and Uniontown at once. The contract for the construction of this section of the line was awarded to Reagan, Lynch & Company. Work will also be begun at once to build a new bridge over Redstone Creek in Uniontown.

Ogden, Logan & Idaho Railroad, Ogden, Utah.—This company, which is an amalgamation of the Ogden Rapid Transit Company and the Logan Rapid Transit Company. plans to begin work as soon as the right-of-way has been obtained by the Ogden Rapid Transit Company on the section of the line in Cache Valley. This will be the final link in the electric line to connect Ogden with Preston, Idaho, via Brigham, Wellsville, Logan and Lewiston.

Corpus Christi Street & Interurban Railway, Corpus Christi, Tex.—Improvements of this company's lines in Corpus Christi are being contemplated.

Portland Railway, Light & Power Company, Portland, Ore.—Material has been ordered and work will be begun at once by this company on the extension through Taylor's Astoria. As soon as this line is completed an extension to Alderbrook will be built.

Tarrant County Traction Company, Fort Worth, Tex.—The Hillsboro Chamber of Commerce has made a tentative proposition to this company to build an electric railway through Hillsboro, offering it a right-of-way and a bonus.

Houston (Tex.) Electric Company.—The bridge across White Oak Bayou has been completed and track laying has nearly been finished on this company's extension through Sunset Heights, northwest of Houston. It is planned to have this line in operation within the next few weeks.

Southwestern Traction Company, Temple, Tex.—Extensive improvements are under way to the tracks and crossings of this railway within the city limits of Temple.

SHOPS AND BUILDINGS

Union Traction Company of Indiana, Anderson, Ind.—Officials of this company spent several days in Marion recently and inspected the sites offered to them as locations for the new terminal station for this company. The city hall and several other sites were considered, the representatives of the company favoring the city hall site above all. This will be available only in case the city vacates this building for the City Market House. Definite action is expected soon.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—This company has opened its new offices at Sixth Street and Francis Street in St. Joseph.

Northern Ohio Traction & Light Company, Akron, Ohio.—A lease on a building about one block from the public square in Canton has been obtained by this company and this will be converted into a terminal station. Alterations will entail a cost of about $20,000 and a like amount will be required to lay tracks for the approach. It will be ready for use about Sept. 1. The Stark Electric Railway Company may use the same station. The change is being made to relieve congestion in the central part of Canton.

Pittsburgh (Pa.) Railways.—A new structure is to be added to the group of buildings known as the Craft Avenue carhouses of this company in Pittsburgh. The structure will be 32 ft. x 65 ft. and of brick, stone and steel construction. Its appearance will be similar to the present office and substation building on this property.

POWER HOUSES AND SUBSTATIONS

Pacific Gas & Electric Company, San Francisco, Cal.—An order has been placed by this company for one 1000-kw, 650-volt, six-phase, sixty-cycle, 600 r.p.m. rotary converter. The apparatus was ordered from the Westinghouse Electric & Manufacturing Company.

Centerville Light & Traction Company, Centerville, Ia.—This company has placed a contract for one 300-kw, 600-volt, three-phase, sixty-cycle, 1200 r.p.m. rotary converter; one 200-kw, 600-volt, three-phase, sixty-cycle, 1200 r.p.m. rotary converter. This apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Atlantic Shore Electric Railway, Sanford, Maine.—An order has been placed by this company with the Westinghouse Electric & Manufacturing Company for one 300-kw, 600-volt, three-phase, sixty-cycle, 1200 r.p.m. rotary converter.

Benton Harbor & St. Joe Railway & Light Company, Benton Harbor, Mich.—A contract has been placed by this company for one 300-kw, 600-volt, d.c., three-phase, sixty-cycle, 1200 r.p.m. rotary converter. This apparatus was ordered from the Westinghouse Electric & Manufacturing Company.

Public Service Corporation, Newark, N. J.—Arrangements are under way by the Public Service Electric Company for the construction of a power house at Point-no-Point on the Passaic River to be used for the development of 200,000-hp to supply Essex County. The cost of the plant is to be about $2,000,000.

Hershey (Pa.) Traction Company.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for one 300-kw, 600-volt, three-phase, sixty-cycle, 1200 r.p.m. rotary converter.

Manufactures and Supplies

ROLLING STOCK

Springfield (Mass.) Street Railway is contemplating the purchase of about ten city passenger cars.

Sao Paulo (Brazil) Tramways has ordered three closed cars from The J. G. Brill Company.

Worcester (Mass.) Consolidated Street Railway is contemplating the purchase of about ten city passenger cars.

Chicago (Ill.) Surface Lines announce that bids will be received until July 8 on 228 semi-steel, double-end motor cars.

Rockland, Thomaston & Camden Street Railway, Rockland, Me., expects to purchase one double-truck snow plow, with body for mail, baggage and freight.

Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., has ordered ten 51 ft. 2 in., all-steel, interurban, arched-roof passenger cars from the Cincinnati Car Company through W. R. Kerschner, its Eastern representative.

Steubenville & East Liverpool Railway & Light Company, East Liverpool, Ohio, has ordered four double-truck cars from the G. C. Kuhlman Car Company. The cars will be equipped with Baldwin trucks and General Electric motors and air equipment.

Southern Traction Company, Dallas, Tex., has ordered twelve city car bodies and truck equipment from the St. Louis Car Company. The order for the electrical equipment for these cars has been placed with the Southwest General Electric Company. This company has also ordered GE electrical equipment to convert four of its city trail cars to motor cars.

Albany Southern Railroad, Albany, N. Y., is giving several of its interurban cars a general overhauling. The company is removing the varnish and replacing the old with new woodwork and is placing sheet steel on the sides and new roof which makes the cars practically steel cars. It is proposed to continue this practice until all of the cars are changed in this way.

Sacramento Electric, Gas & Railway Company, Sacramento, Cal., has ordered six 41-ft. city passenger cars of the California type from the St. Louis Car Company, through its Pacific Coast agents, Pierson, Roeding & Company, San Francisco, Cal. The cars are to be delivered early in September. With the order is an option on four more cars of the same style which are very similar to the cars which are now in service in Stockton and Fresno. The new cars will have seating capacity for forty-four passengers. They will be mounted on Brill 75-E trucks with a GE-No. 203 motor on each truck. The car bodies will have semi-steel bottom frame, flush platforms, monitor deck roof and ash interior finish. Rattan cross-seats will be installed in the closed section and wood slat seats of the Brill "Winner" type in the open sections.

TRADE NOTES

Hart & Hegeman Manufacturing Company, Hartford, Conn., has been appointed exclusive selling agent for the H. T. Paiste Company, Philadelphia, Pa.

The J. G. Brill Company, Philadelphia, Pa., at a recent meeting of its board of directors, appointed W. H. Heulings, Jr., as vice-president, J. W. Rawle as second vice-president and E. P. Rawle as treasurer.

Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has organized a bronze department for the manufacturing of titanium bronze specialties under its various patents and has appointed Wm. M. Corse as manager of this department. Mr. Corse was formerly works manager of the Lumen Bearing Company, Buffalo, N. Y., and recently general manager of the Empire Smelting Company.

American Mason Safety Tread Company, New York, N. Y., has received an order from the Boston Transit Commission to equip with safety treads the new subway stations of the Boston Elevated Railway. An initial order for about 2000 sq. ft. of safety tread for equipping the Massachusetts and Copley stations has already been placed. Since Jan. 1 this company has furnished somewhat over 10,000 sq. ft. of safety tread to the Interborough Rapid Transit Company for the stairs and platforms of its subway and elevated stations.

I. Brooks Clarke, formerly superintendent of the New York & Long Island Traction Company, has opened an office at 431 Fifth Avenue, New York, as "safety engineer" for electric traction properties. Mr. Clarke has specialized in this and other closely allied lines of electric railway engineering since he was graduated from Cornell in 1900 and is prepared to advise electric railway companies in regard to the possibilities of reduction of accidents through the proper instruction of trainmen, in the reduction of power consumption in car operation, as well as in the reduction of troubles with train control and with straight and automatic braking for multiple unit operation. If desired, he is prepared to take charge of putting into operation plans of this kind as well as systems for the instruction of employees in efficiency in single car operation or train operation. His experience well fits him for work of this kind. For seven years he was engaged in this work for the Brooklyn Rapid Transit Company, and for the last three years of this time he had the title of assistant superintendent of the elevated lines. For a year he undertook the same work for the Public Service Railway of New Jersey. He was also for three years with the Westinghouse Air Brake Company and for six years in the shops of the Georgia Railway & Electric Company, Atlanta, Ga.

ADVERTISING LITERATURE

J. G. White Management Corporation, New York, N. Y., has issued an attractively printed booklet entitled "The Management of Public Service." The booklet presents a clear and concise discussion of the proper management of public service companies by showing how this ideal may be approached through observance of the following principles: (1) security of investment, due to harmonious working relations with the municipal officials in the community served and the support of public opinion; (2) wise development along systematic and conservative lines of the communities served and the properties serving them; (3) protection from competition by satisfactory quality of service; (4) economical and efficient operation by specialists who keep in touch with unit costs of operation and who are able to give clients the benefits of experience obtained on other properties; (5) proper maintenance and renewal of physical property; (6) establishment of a clear and comprehensive accounting system; (7) assisting clients in the general financing of their properties and marketing of their securities; (8) proper and thorough engineering and construction at reasonable cost; (9) a central and efficient purchasing department, which by large volume and wide range of purchases may be in a position to insure extremely low prices; (10) confidential and loyal relations with clients.

NEW PUBLICATION

Proceedings of National Association of Railway Commissioners. 612 pages. Law Reporting Company, New York, N. Y. Black Cloth, $1.

This volume is a complete report of the proceedings of the National Association of Railway Commissioners at the twenty-fifth annual convention held at Washington, D. C., Oct. 28-31, 1913. The chief value of the book to the electric railway industry lies in the fact that it contains the complete committee reports and papers before the convention on such subjects as the relation of service to rate making, accounting side of rate making, statistics and accounts of electric railways, depreciation and its relation to the fair value, elements of appreciation in valuation, railway capitalization laws, valuation decisions, relation between valuation and rate of return and the like. Abstracts of the most important of these reports and papers were published in the issues of the ELECTRIC RAILWAY JOURNAL of Nov. 1 and Nov. 8, 1913. Since the regulative powers of the commissioners who are members of this national association have been extended in many States to cover public utilities other than steam roads, the proceedings of the national body are becoming of increasing importance to the general public utility field.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.
Consolidation of Street Railway Journal and Electric Railway Review

Vol. XLIV NEW YORK, SATURDAY, JULY 11, 1914 No. 2

EFFICIENCY AND PERSONALITY

At the Bluff Point convention of the New York Electric Railway Association, reported in last week's issue of the ELECTRIC RAILWAY JOURNAL, three papers were presented under the vague but fashionable title of "Efficiency." In suggesting this title the program committee obviously intended to allow great latitude of treatment. There was, however, a thread of unity in the papers, in spite of the fact that they were written independently and from three points of view. As Mr. Sawyer pointed out, the term "Efficiency," as understood in its application to electric railways, is simply old-fashioned good management. To paraphrase a famous quotation, "that which we call efficiency by any other name would bring as good results." The thread of unity which appears in the papers of Messrs. Bagg and Witherwax and which binds them to Mr. Sawyer's "good management" paper, is the recognition of personality as the basis of efficiency. The officials must by personality inspire the men in the ranks; the latter must take personal pride in their work and the organization of which this work is a function, if not the function.

THE HUMAN ELEMENT IN WORK

In these days of scientific management there is a tendency to ignore the human element in humanity; to create industrial machines which shall turn out their products at maximum speed and at minimum cost. To be sure, the attempt is made to remunerate the workers handsomely for their labor with the purpose of furnishing them the wherewithal to live more comfortably. So far as such a process is mechanical, however, it cannot yield the best results. Man is not a machine and he "does not live by bread alone," no matter how much of it he gets. We therefore must heartily agree with the writers of the papers in question in such typical thoughts as "efficiency is the result of that kind of influence that makes for co-operation and a desire to serve," "the whole organization should understand that the higher officials are ready to encourage anything that will stop waste and increase efficiency" and "the greatest good to the greatest number is brought about by efficient co-operation." A prime requisite for promotion to positions of authority should be the possession of those distinctly human qualities which will inspire affection as well as respect. We are all attracted to the organization in which the manager is referred to as "the chief," "the boss," "the mogul," or some such human term.

DEFECTS OF THE CROSSER REPORT

It would be difficult to conceive a congressional report in favor of a measure of great and far-reaching consequence that entered less into the merits of the proceeding than that filed by Representative Robert Crosser of Ohio in support of his bill for the government ownership of the street railways of the District of Columbia. Mr. Crosser writes glibly enough about the "great advantages" of government ownership, of better service and lower fares and higher wages. But he gives no basis for his belief that any such thing would happen if the government of the United States were to undertake to run the street railway systems of the nation's capital. Nor is there a word as to the machinery by which such an enterprise would be operated. The members of the Public Utility Commission who testified before the House committee admitted freely their inability to cope with the problem of regulating the lines within the district. This certainly makes it reasonable to doubt their ability to operate. But Mr. Crosser offers no solution for this question. As to the great financial problem involved in this enterprise there is not a line in the report except charges that the existing companies are overcapitalized. How much it would cost to procure them under the condemnation proceedings outlined in the bill, Mr. Crosser does not say. He contents himself by making personal estimates that the physical valuation of the existing lines approximates $25,000,000. This, he points out, is half the capitalization. He does not suggest, however, that the government would confiscate the other half of the market value of the securities outstanding. His bill provides that the necessary funds are to be raised by the sale of a 3.65 per cent issue of bonds in the name of the District of Columbia, but that this issue is to be backed up only by a lien on the revenues of the companies. Mr. Crosser does not suggest any market where bonds on such a tenuous foundation could be sold at par. Nor does he intimate where the money is to come from that will pay the interest and the sinking fund charges provided for in the bill, if the revenues prove inadequate.

THE SITUATION AT WASHINGTON

Although a considerable portion of the hearings held were devoted to a futile attempt to discover any popular sentiment in the District of Columbia in favor of government ownership, Mr. Crosser carefully avoids mentioning this phase of the question. As a representative from Cleveland, he is eagerly willing to fasten upon the taxpayers of the District of Columbia an experiment for which they will have to pay the price—not he. According to every indication the people of Washington, so far as they have given any thought to the matter at all, are opposed to the plan of saddling the expense upon them. The fact is that the municipal ownership propaganda in Washington is an importation from Cleveland. And it is interesting to note that Mr. Crosser devotes a considerable part of his report to a description of the situation in that city and that his first act, after filing his report, was to hurry to Cleveland to handle his campaign for renomination and re-election. Evidently his fight for the "Tom Johnson idea" in the city of Washington was intended to play an important part in his own campaign at home. But the proposal to initiate municipal ownership there has focused national attention upon the question and was the means at the hearings of bringing out many expressions of opinion opposed to the plan, and of exposing many of the inherent weaknesses of municipal ownership of city railways which perhaps would not have been presented if the city under consideration had been less prominent than the national capital.

THE ADVANCE OF THE STEAM TURBINE In this issue of the ELECTRIC RAILWAY JOURNAL we print an extended abstract of the report of the committee on prime movers of the American Institute of Electrical Engineers. The remarkable feature of this report is the record which it contains of the triumph of the designers of the steam turbine in very greatly improving the thermal efficiency of this type of prime mover. In very large sizes the steam turbine now rivals the gas engine from the standpoint of efficiency. It is slightly superior to the gas engine when carrying a load of more than one-half its capacity. From a thermal standpoint the oil engine is the only one now possessing an important advantage over the well-loaded steam turbine of large size. The steam turbine won its way into favor primarily because it occupied small floor space and was light in weight per unit of output. These virtues it possessed because of the high speed of its rotating parts and its structural simplicity. In economy of steam consumption it had as a formidable and well entrenched rival the highly developed Corliss engine. At first the steam consumption of the turbine was excessive. The proper operating conditions had not been worked out, and many new and difficult design problems had to be solved. The steam turbine requires high-pressure, superheated steam, good vacuum and careful loading for best results. The report shows that, given proper conditions, turbines can now be expected to produce a thermal efficiency of 20 per cent or more in units of 2000-kw capacity and upwards. Of course, the greatest advantage possessed by the steam turbine is its low cost per unit of output capacity. This cost is so low and the fuel economy sufficiently high that it is difficult to generate energy more cheaply even by water power where a considerable steam reserve is necessary.

HIGHWAY CROSSING SIGNALS

Increased attention has lately been given the problem of choice and installation of highway crossing signals. This quite probably is due in a large measure to the automobile as well as to the more and more insistent demand on the part of the public for greater service refinements and protection. So many types of highway crossing signal apparatus are available for use that some views about the choice and installation of highway crossing protection systems may now be of particular interest.

Highway crossing signals perform two functions. First, they designate the location of crossings between railways and highways, and second, they announce the approach of trains to crossings.

Probably the simplest form of signal for performing the first function, that of informing the traveler on the highway that he is approaching a railroad intersection, is the old-fashioned "stop, look, listen" signboard. Somewhat similar boards are now being used as distance signals for crossing bells. They are placed near the highway and a short distance away from the railway track, and serve to notify the traveler that he must be on guard because he will shortly reach a more or less hazardous location.

One road in Iowa reports most satisfactory results from these highway distance signals. It has installed such signs close to the highway about 500 ft. in advance of the crossings. The signs read "Railroad Crossing 500 ft." They are illuminated at night, and their chief value is that of giving a warning to the tourist and thoughtless driver who may not know or realize the close proximity of the railroad crossing. Almost any driver, after passing such a sign, will take measures to assure that there is no danger in crossing the tracks and will obey the crossing signal at the tracks.

The second function of the highway crossing signal, that of announcing an oncoming train, is more difficult of performance. Various means have been employed successfully. Among the more common types now available for installation on electric railways are the simple illuminated crossing sign, the intermittently illuminated sign, which gives repeated flashes of light, the signal with moving parts imitating the waving or swinging of a red blade or flag, and various combinations of these aspects, all designed to be arrestive. Combined with these visible indications are audible indications such as bells, gongs and sirens. Another distinct type of mechanical crossing signal is the barrier or gate. This consists of one or more long poles from which are hung ticklers that make a screen across the roadway. In emergency an individual or vehicle may pass through this screen, and thus no one can be caught between the gates, but the effect is to block the crossing positively to the highway traveler.

The flashing lights have two aspects: first, the stationary lamp with its continuous or intermittent illumination, and second, the swinging lamp or row of lamps, the lighting of which is so timed as to stimulate the swinging lantern. In daylight none of these illuminative effects is of sufficient arrestiveness and so they are combined with various types of visible and audible signaling.

The prime requisite in a highway crossing signal is reliability. Unless a signal is very reliable it will not command the respect of the frequent traveler, and it may even introduce a hazard from this cause. A highway crossing signal should be so controlled that the train, by passing certain limits or being within a certain section, will cause itself to be announced at the crossing. There are two forms of control, intermittent and continuous.

With the intermittent control the electrical signal release is actuated either by the passage of the car wheels or the trolley wheel. The car-wheel type of intermittent control may be the old-style steam railroad track instrument, a short insulated track section, or a contact bar, placed adjacent to the rail and so located that the flange or tread of the wheel will touch it. Another type successfully used is that in which the intermittent control is obtained by the movement of the rail. This movement in one make of signals is mechanically multiplied and drives a small generator which supplies an electrical impulse to release the bell. In another kind the movement of the rails opens or closes balanced contacts attached to the base or side of the rail.

By each of the foregoing intermittent-control devices the highway crossing signal is started and stopped by the passage of any car, whether it is electrically equipped or not. The second, and very common form of intermittent control (trolley contactor type), is actuated by a trolley wheel passing along the wire, the wheel either mechanically throwing a switch or electrically making a desired contact. Contrasted with these intermittent forms of control is the continuous control obtained with track circuits to which are connected interlocking relays that in turn energize the crossing bells and lamps whenever a car is passing through or standing within the block.

A feature of importance which should be recognized in the design of highway crossing protective apparatus, in addition to that of reliability, is that of continuity of signaling, even though more than one train may enter the ringing limits at one time and, later, one train should pass out or both stop for some time and then proceed across the highway. Thus car-counting devices are an important feature in the trolley-contact control. It is desirable to arrange the control so that if several cars pass the contactor and one or more then recross it, the bell will keep ringing as long as there is one car inside of the protected zone. Of course the continuous track circuit performs this function in the ideal way. But on an electric railway means must be taken to carry the return propulsion current through the track-circuit protected territory. With trolley-contact control and with mechanical rail control the desirable feature just mentioned may be approached by placing extra contactors or restarters between the first starter and the crossing.

There is a wide variety of highway crossing signal apparatus available for installation on electric railways, but even with the good work which has been done in the past here is a field of wide scope that is growing wider and wider and one which can very profitably be studied by the manufacturer. And it should be remembered that no one can successfully develop and market a highway crossing signal without an intimate knowledge of the railway companies' requirements.

WHERE THE MEN HELP

A recent incident on an interurban electric railway seems worthy of mention in these days when silent sabotage has become an accepted doctrine among a certain class of labor leaders. This line does a large baggage business both on service and passenger cars. The rates for material carried on the baggage cars were on a weight and classification basis, but there was no limitation to the size or contents of the packages which could be carried on the passenger cars. The result was that shippers could often save money by sending bundles via the passenger cars at a loss to the railway and at great inconvenience to the crews and car riders. The management finally decided to curb this practice by issuing limiting regulations and specifying the use of certain labels. It was fondly believed that the evil had thus been cured until several trainmen voluntarily advised the general manager that the labels were being attached to material that should have gone at higher rates by way of the baggage cars. The best part of this story is that the men had not even been requested to see that the shippers obeyed the new regulations. As a result of this watchfulness by the trainmen, the company is likely to increase its baggage and package revenue by several thousands of dollars a year.

There is no doubt that by intelligent co-operation between the men and the company the net receipts of the company can often be greatly increased. A great many companies are recognizing this condition in their campaigns of "safety first" for reducing accidents and by the introduction of methods of rating motormen in their use of energy. These are steps in the right direction but by no means limit the opportunities for effective co-operation. A motorman can do more than save current and avoid accidents and report any defects he may see on the line. He can keep a sharp lookout for passengers who are waiting to board the car, and on a city line he can pick up a good many short-haul passengers who, if they are passed by the first car which they attempt to take, will often walk to their destination. This duty of watching for waiting passengers is also one in which the conductor can assist greatly, if he does not take the initiative. Indeed, some of the European lines have offered premiums to the different car crews for the number of passengers carried on their cars on the theory that it will encourage watchfulness in behalf of the company in this particular direction.

Montreal Tramways Shops at Youville

A Roofed Transfer Table, Clean Air Heating and Ventilation, Full Clearance Mill Room, Extensive Manufacturing Facilities and Simplified Storage and Supply Practices are Among the General Features in Addition to the Individual Shop Methods

The Youville shops of the Montreal Tramways, which were completed about a year ago, afford a good example of an installation located far enough from the heart of the system to permit satisfactory areas for each department with ample extra ground for future expansion. Dead mileage is the only objection that can be urged against the location of shops as far as 5 miles from the center of the city, but in Montreal this factor is very small because all carhouses are equipped for replacement work. The Youville plant serves for the complete overhauling of cars, which is carried on at approximately annual intervals, for the large amount of home manufacturing required by Canadian conditions and for the installation of equipment on car bodies as received from the builders. At this time, the company is operating 850 cars, including 200 new ones which were equipped at Youville during the past twelve months. An additional order of seventy cars will be completed shortly.

The layout as hereinafter described was designed and fitted out under the general direction of D. E. Blair, superintendent of rolling stock, with Charles Remelius as consulting engineer during a part of the planning and construction period.

GENERAL LAYOUT

The shops cover an area 4800 ft. long x 570 ft. wide, the individual sections totaling 148,186 sq. ft. as shown in the detail tabulation under the accompanying plan. All of the important departments are housed in one fairly rectangular structure, but several small buildings are placed either adjacent to or at some distance from the property to isolate such fire risks as the oil house, paint-mixing room, power house, acetylene-generator house, lumber shed with dry kiln, etc. On account of this plan, the main building is practically open throughout except for the cheap corrugated iron partitions which separate the painting and woodworking sections from one another and from the transfer table. All buildings are constructed of brick on concrete foundations. The shop sections are furnished with saw-tooth roofs facing northeast, but the transfer table between them has a high monitor roof. Experience has indicated that a cheaper form of roof would have been satisfactory over the transfer table because the adjoining shops transmit ample light for such simple work as car movement. Cinder is used for the floor of the transfer table section, but in the shops the company uses a foot-easy and non-chipping mastic asphalt which is guaranteed for ten years. This floor is so elastic that wheel marks, furrows and the like disappear in time or can be rolled out.

The most striking point about the general design is the use of the covered transfer table which cuts the main structure in half and serves as the go-between of the truck and motor overhaul sections on one side and of the body overhaul sections on the other. Primarily, the transfer table was covered simply to insure freedom from snow, but the use of a covered table has several other advantages. Thus, the sheltered location and infrequent opening of this bay keep the shops free from exposure to the cold, enable the shifting crew to work in comfort, save time through the elimination of track doors, and by permitting uniform heating in winter

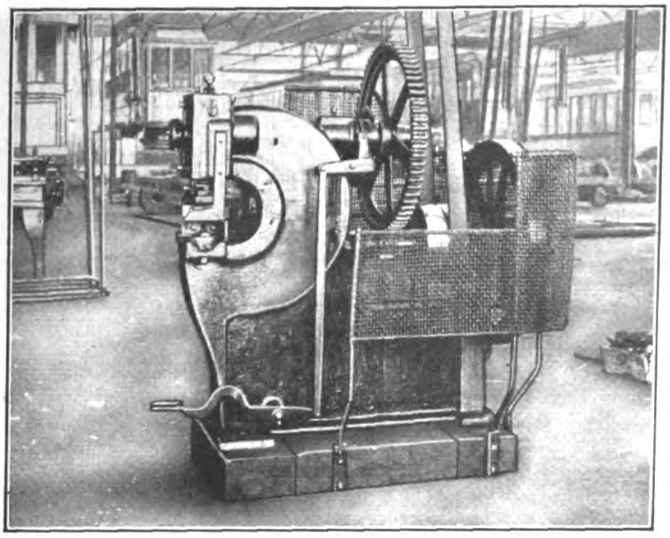
make it possible for newly painted and varnished cars to be shifted from track to track with perfect safety. The table was built up of I-beams and old motor and control with other odds and ends at a cost of $480 exclusive of motor, compared with a bid cost of $1,200 from an outside contractor. It is operated by means of a protected third-rail with side contact.

The simple, direct course of a car which enters the shop for overhauling is so clearly indicated on the plan that no comment is necessary. Of the fifteen tracks on the metal-working and electrical side, twelve are furnished with pits 104 ft. long and with motor-driven screw hoists of I-beam construction. A thirteenth track is also furnished with pits; it has no car hoists, but like the others is served by jib hoists. The first track on the entrance side is within range of a jib and is used for handling material to and from the armature room. The last track on the same side is used for the wheel and axle shop, but unlike the others it is continued to a yard loop as shown.

The shops behind tracks Nos. 1 to 14 are arranged in the following order: electrical, main machine and blacksmith. The wheel and axle shop is placed between the wall and its serving track. The extensions on this side of the building comprise a machine shop store with air-brake repair room on a mezzanine floor, a coil-baking oven and impregnating tanks and a fan room for Sturtevant heater and a toilet room.

On the opposite side of the shops the first building is the mill room. Of the thirteen tracks which lead from the transfer table and are 176 ft. 3 in. long, four are used for body woodwork; eight for car washing and painting and one for panel varnishing.

The key numbers and the list on the accompanying plan show the wide variety of tools in service in all shop divisions.



MONTREAL SHOPS—SMALL SHEAR SHOWING GEAR PROTECTION

Heating, ventilation and lighting are supplied from an isolated power house. The latter is divided into a transformer room of 180-kw total capacity where purchased energy transmitted at 13,000 volts is stepped down to 110 volts and 220 volts for the lighting and the machine tool operations respectively, and a boiler room with three 125-hp boilers which supply steam at 100-lb. pressure for the indirect heating system. The electrical room also contains a 500-kw motor-generator set for the suburban railway service.

The steam is transmitted via a tunnel to two fan rooms, one alongside the mill room and the other alongside the machine shop. Most of the outlets of the hot-air duct from the heating apparatus are in the varnish and paint rooms where it is desirable to maintain a temperature of 68 deg. to 70 deg. Fahr. On its backward turn the warm air passes through the paint shop to the working sections and the mill room. The mill room is so located that the effect of the downdraft exhaust system is to confine the dust-laden air to that section. The result is that only clean air is reheated. The proportion of air which is drawn from the building by the mill room exhauster is replaced by fresh air which enters an 8-ft. x 2-ft. opening in the side wall close to the heating coils. When the heated air leaves the circulating fan it passes through a tunnel, the floor of which is covered with water about 3 in. deep. During the first few months of operation, when the mill room was operated without an exhaust system, a large quantity of dust was collected in this water trap. However, since the exhausters were started, very little dust gets into the tunnel. The water trap not only catches any dust particles but also humidifies the air, which is very desirable for paint and varnish work because of the dry winter climate of Montreal. The object of circulating the air from the mill-room plant as described is to give the paint shop the cleanest and warmest air; furthermore, the mill room, like the machine shop, creates quite an appreciable heat from the operation of its machine tools. Thermometers are installed throughout at convenient intervals to record the drop in temperature, and the outlets may be closed one by one as desired. In practice, the fireman reads only the end thermometers and regulates the steam supply and fan speed according to the readings.

The heating and ventilation of the metal-working shops presented an interesting problem on account of the down-draft forges and babbitt furnace therein. By careful tests with streamers the duct outlets and blower fan draft are so regulated that all air currents are directed toward the corner where the down-draft equipment is located. In this way all fumes, smoke, etc., are drawn in by the suction fans to make an odorless, smokeless and smudgeless shop.

Tungsten lamps ranging in capacity from 60 to 250 watts are used throughout for shop lighting. All wiring is in conduit of Crouse-Hinds manufacture.

Compressed air for shop purposes is furnished by two

MONTREAL SHOPS—PART OF THE AIR-BRAKE ROOM, SHOWING THE CONVENIENT FORM OF WORK BENCH AND OIL BATH FOR COMPRESSORS

Reavell electrically operated automatic air compressors, each having a capacity of 100 cu. ft. of free air per minute. These compressors and their storage tank are placed in the machine shop fan room.

Attention has already been called to the practice of keeping all combustible departments outside of the main building. Care is also taken to keep only the smallest practicable amounts of inflammable liquids in the building. No oil is stored there over night, compressed air being used to bring it to the shops when it is wanted during the day.

Fire protection is afforded in part by the Reichel thermopile system, the indicator equipment of which is shown in an accompanying cut. The thermopiles are placed at different points in the roof. If the temperature in their vicinity suffers a comparatively sudden rise the thermopiles generate a sufficient voltage to operate a positive contact device with indicator, the mechanism being virtually an adaptation of the principle of the moving coil voltmeter. In operation it was found that the thermopiles were so sensitive that those in the blacksmith shop had to receive another coat of paint. In addition to these thermopiles copper-wire thermostats are installed in the impregnating room, paint storage, oil room, lumber kiln and boiler room. A fire in any of these rooms closes the circuit and causes the lighting of the corresponding lamp on the indicator board and the ringing of an alarm gong. The fire-fighting apparatus comprises wall extinguishers, ten hydrants with 125-lb. city water pressure, chemical and hose wagons and fire pails. A fire brigade is schooled in the handling of this equipment. In spite of these precautions, all the property of the company is fully insured with the underwriters.

SOME EQUIPMENT FEATURES OF THE METAL-WORKING AND ELECTRICAL SHOPS

Brief reference has already been made to the car hoists of the overhauling tracks. These were built at the shops and are operated with old motors. They embody pairs of 12-in. x 30-ft. I-beam carriers which are raised through worm and gear mechanism to a height of 6 ft. above the floor. One double-throw switch is used to enable one control to operate two hoists. The jib hoists so liberally supplied in addition to the car hoists make heavy manual work absolutely unnecessary. The pits themselves are of concrete and are 4 ft. 8 in. deep. Their rails are set on oak blocks embedded in concrete and are flush with the shop floor. In addition to a narrow-gage track on the pit floor for moving equipment, cross-pits are also provided for the convenience of the men. The pit lamps are in wall pockets and are all provided with a 12-ft. extension cord.

Of the manufacturing and repair sections the electrical shop is first in line. The layout of the principal parts is clear from the general plan, but this does not

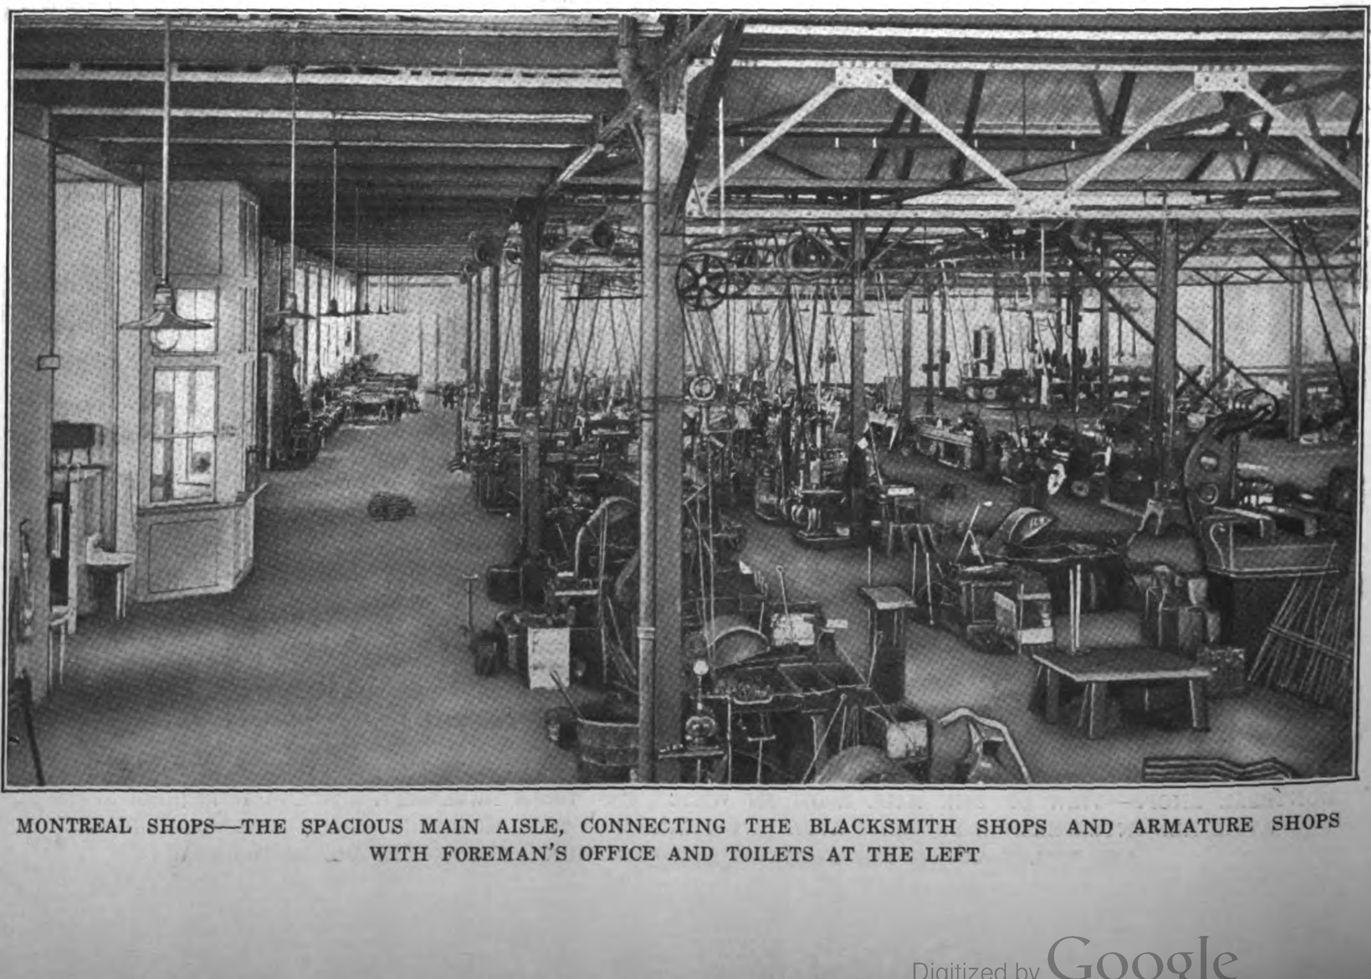
show the overhead track with air hoists which curves in and out from tool to tool in such order that an armature during its complete course from delivery to return never once touches the floor. All parts of armatures and fields are made here. Fields are impregnated by means of the Passburg vacuum system.

Of the tools in the main machine shop the N. S. K. 480-lb. air hammer made by Peter Pilkington, England, is of particular interest. This machine is much faster than a steam hammer, may be operated by manual or automatic control and is capable of very fine adjustment. With it a man ordinarily can make thirty heavy compromise joint plates in a day of ten hours, with thirty-two as a high-water mark. Another interesting tool here is a Butler three-spindle drill. In the central machine shop and electrical shop group drive is used from one 25-hp and two 15-hp motors, each carried from the roof trusses; but elsewhere in this division of the building individual drive is common.

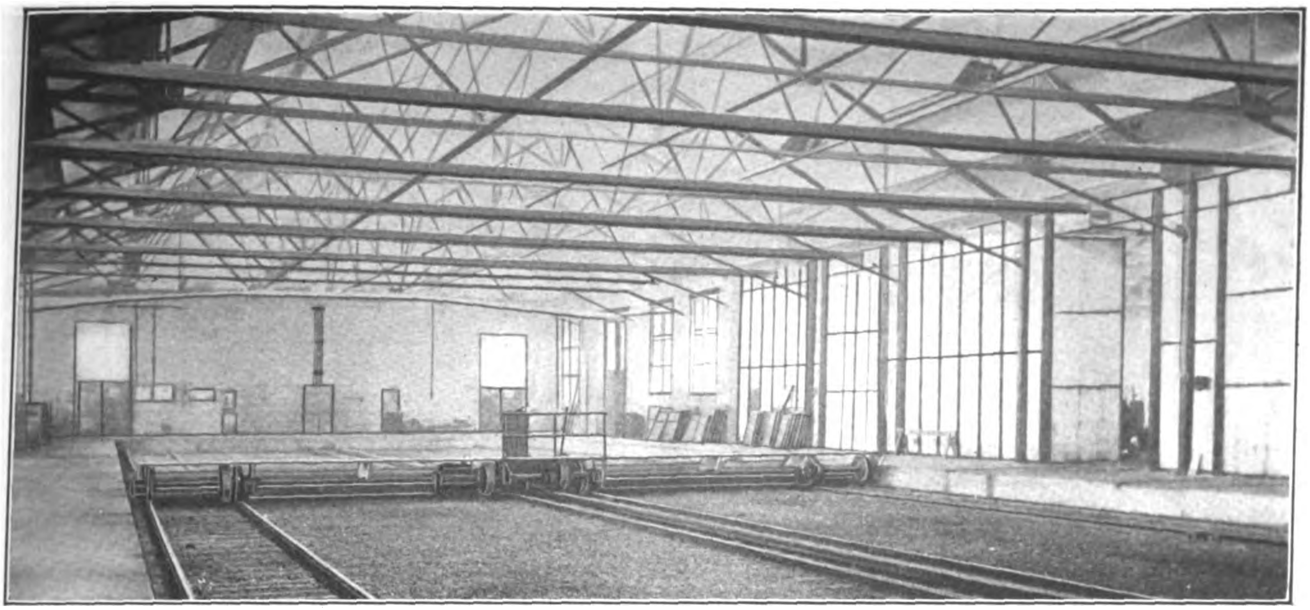
A large Jacobs oil furnace is installed in the blacksmith shop for handling long car members, but at present a small oil furnace and six down-draft forges are found ample for all regular work. The down-draft babbitt furnace previously noted is fitted with a direct-reading pyrometer. Babbitt is always poured at a temperature of 675 deg. to 700 deg. Fahr. within which range no segregation will occur when the mixture settles. This babbitt is composed of 83 1/3 per cent copper, 8 1/3 per cent antimony and 8 1/3 per cent tin. It may be added here that the company's axle bearings are of bronze only. They are serviceable for at least 50,000 miles, and on account of this long life, their freedom from accident and their high scrap value, they have proved the cheapest in the end. A tinsmith shop with punch and shear was added to the original equipment last summer to care for the large amount of sheet steel manufacture and repair.

The hydraulagraph record on the wheel press is credited with obviating the eighty to one hundred loose wheels a year which were common before this graphic telltale of the pressmen's work was installed. Since the hydraulagraph was installed in 1912, not one trouble has been traced to the application of the wrong pressure. One man, with one helper to assist him during the afternoon only, bores and mates all wheels and keeps all records. He has bored as many as eighty-four wheels in seven hours.

A safety feature of all machine tool work is the use of screens to protect the men against belting, wheels,



MONTREAL SHOPS—THE SPACIOUS MAIN AISLE, CONNECTING THE BLACKSMITH SHOPS AND ARMATURE SHOPS WITH FOREMAN'S OFFICE AND TOILETS AT THE LEFT



MONTREAL SHOPS—THE COVERED TRANSFER TABLE RUNWAY SHOWING ALSO THE CORRUGATED METAL TRACK DOORS AT THE PAINT AND VARNISH SECTION

etc. To achieve the best work and to secure the desirable standardization, such duties as sharpening tools, drills and bits are assigned to one man. The production of the men has been marvelously increased by the use of pneumatic tools for boring, riveting and the like. At first they were rather afraid of the air-operated tool, but on better acquaintance they were glad to use it because it does not tire them like hand labor.

AIR-BRAKE DEPARTMENT

The air-brake department is located on the mezzanine floor, as shown on the plan. A half-tone view of the shop itself is also presented. Compressors are overhauled once a year, the stripping and assembling being done on a bench which is furnished with sliding pieces or movable deals so that a man can always work on the most convenient side. After the compressors have been stripped of all electrical parts they are lowered into a metal tank for cleansing, as illustrated. This tank contains kerosene which is forced up from outside storage tanks by means of compressed air. This scheme greatly reduces the fire hazard, especially at the close of the day's work, because the oil can be made to return by gravity to storage simply by cutting off the air pressure through a valve located on a near-by wall. The air-brake shop is also provided with apparatus for grinding valves and for testing out all air-brakes under service conditions, also with a Galena steam turbine filter for purifying the compressor oil.

OIL HANDLING

As indicated, the oil is stored in an isolated one-story and basement building. The building is provided with an overhead trolley for lifting the barrels on to a double set of racks. When oil is required for use it is taken from basement storage tanks by means of Bowser pumps. The basement also contains a waste and oil reclamation outfit.

WELDING PRACTICE

The general plan shows an acetylene generator house. The company prefers the oxy-acetylene process for light work and cutting. Electric arc welding has been found superior when large masses of metal must be heated. At this time the company is using trolley line energy at a cost of about ¾ cent per kw-hr., at which price electric welding is cheaper than oxy-acetylene, even with

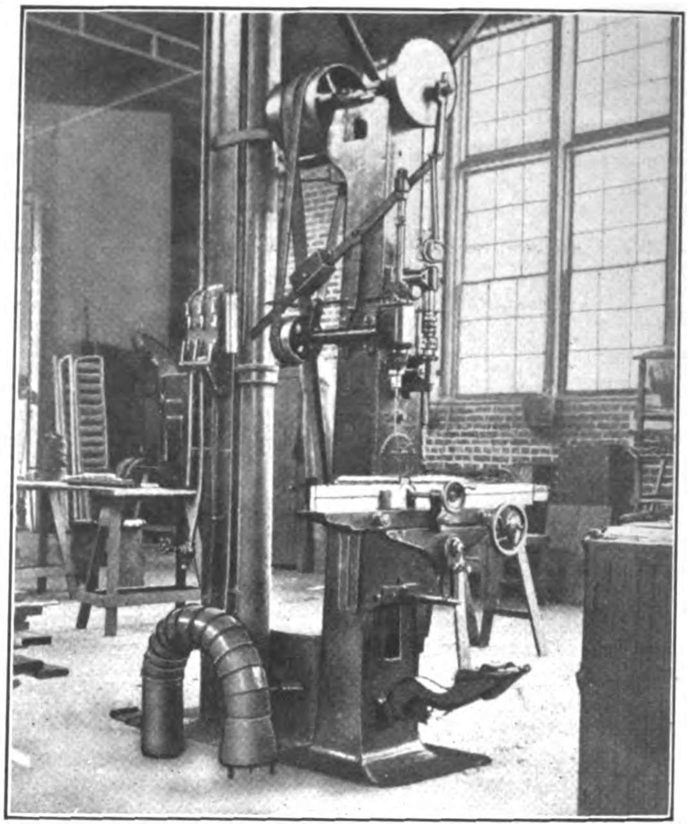
the losses due to cutting down the potential from 500 volts to 70 volts at the arc. The welding flux used at Montreal consists of 28 per cent dry sodium carbonate, 70 per cent powdered crystalline borax and 2 per cent red iron ochre.

WOODWORKING AND PAINT SHOP

The mill room which is equipped to carry out any kind of car body work has several features worthy of imitation. Owing to the layout of the tools and the use of the less obstructive floor-drive belting, timbers up to 40 ft. length can be handled at each machine without interfering with the others. The inconspicuous belting and the elaborate shavings exhaust system make this shop as clean and safe as possible. All revolving parts of tools are fitted with wire screens or wooden guards to prevent injury to the workers.

The dry kiln and lumber shed are located in an adjacent lean-to, which has an individual through-supply track as shown. The body woodwork shop adjoins the mill room and is supplied with four tracks, all of which have pits. This shop is used not only for regular body work but also for wiring. An illustration taken in this division shows how bent car sides are straightened. No columns or walls were available for use as braces. Therefore it was necessary to set in the floor on each side of the track four I-beams on which a horizontal I-beam of nearly maximum car length is placed. The I-beam structure itself is braced by obliquely-set pipes of 4 in. diameter. The bent car side is straightened by operating jacks which are set horizontally between spacing and buffer blocks on both sides of the track.



MONTREAL SHOPS—OUTLET FOR FLOOR SWEEPINGS IN THE WOODWORKING SHOP

The main paint shop is separated from the other departments by a corrugated-iron partition. It has nine tracks, three of which have pits. The space between the last shop and the wall is also partitioned to form a panel and sash varnishing room. All paint mixing is done in a separate building near by, still further reducing the possibility of fire.

MANUFACTURING AND STORES PRACTICE AT THE YOUVILLE SHOPS

The company manufactures a large variety of railway supplies. Formerly this material was made on a hand-to-mouth basis. The cost, however, has been materially reduced by manufacturing in quantities which are turned over to the storekeeper at a fixed price. The practice of quantity work is also followed in handling parts returned for repair. The price of manufactured articles, as turned over to the storekeeper, covers material and labor only, but at the end of the year a general overhead charge which averages 14 to 15 per cent is added to the figures for this class of work.

MONTREAL SHOPS—WINTER VIEW OF THE YOUVILLE SHOP FROM SOUTHWEST, WITH THE POWER HOUSE SUBSTATION, OFFICE AND STORES AT THE LEFT

The storeroom is located in a separate building which also contains the offices of the superintendent of rolling stock, the drafting rooms, etc. The storeroom as built covered only the floor areas shown, but since then a gallery has been provided. This building is served by a special track for the convenient reception and dispatching of supplies. This storeroom handles all supplies used at the general shops as well as at the carhouses. Each carhouse has a sub-store with storekeeper, and all supplies are "in stock" until used.

In the blacksmith shop a sub-store under lock and key is provided for all standard sizes of iron. The pieces are placed on shelves which are readily visible through the screens. When a blacksmith runs out of stock he must notify his foreman, who is the only one authorized to secure material. This practice is substantially the same throughout all the shops. In general, about 90 per cent of the material which is used by the workmen is brought to them by errand boys. The workman simply rings a bell and secures the material after his order for the same has been properly authorized by his foreman.

GENERAL STORES SYSTEM

The car maintenance department is responsible for all supplies from the time that they leave the storekeeper on requisitions indorsed by the master mechanic until he returns them back to the storekeeper as scrap. The question as to what is scrap is not left to the carhouse foremen for determination, but to two specialists at Youville. These men divide all return material into three heaps, the first called "good for repair," the second "doubtful" and the third "rejected." The master mechanic has the last word as to what "doubtful" pieces shall be repaired. The scrap is carefully weighed and turned over for formal receipt by the storekeeper. Allowance is then made to each carhouse under the proper account number, and finally the auditing department assigns the credits on a money basis. The manifest which accompanies the material returned by any carhouse is regarded as an order for substitute material. It will be noted that under this system the storekeeper has nothing to do with any material from the time that it leaves him new until it is to be sold for scrap. The sub-stores at the carhouses can order as new only such material as brushes and dry batteries which are not subject to repair, but even these orders must be approved by the master mechanic before they go to the storekeeper. No carhouse receives substitute parts unless it returns an equivalent number of old parts. The necessary adjustments for lost material are made monthly. This system of concentrating at the main shops all responsibility for life of material was inaugurated Nov. 1, 1912. It has worked out very well, especially in avoiding the unnecessary scrapping which arises when carhouse men are too eager to get rid of material which, while old, is still capable of repair and perfectly safe for re-use.

EMPLOYEES

While the shops are notable for many labor-saving features, very little has yet been done in the inauguration of piece work, owing partly to the peculiarity of local labor conditions and partly to the desire to obtain more experience in determining real costs on the day labor basis before attempting to inaugurate a system based upon individual productivity. However, complete piecework schedules have already been worked out for the electrical shop, and this will probably be the first department to change from the day basis. The time of the men is now kept on clock cards which print normal time in blue and late time in red, so that the timekeeper in checking up need look only for red figures.

Ten Rules for Service

In the May issue of *The Annals* of the American Society of Political and Social Science, P. A. Sinsheimer, stock and bond expert of the California Railroad Commission, contributes an article entitled "Ten Rues for Service." This paper is not an enumeration of regulations that have been adopted by this commission, but rather an outline of the broader principles that have guided it as its decisions are interpreted by the author. The ten rules which compose the author's code are discussed in regard to their legal and economic aspects, and in connection with each a complete explanation is presented as to the reason for the wording. The rules determined upon are as follows.

1. Service must be measured primarily by the needs of the public and only secondarily by the ability of a given utility.
2. Adequate service is the price a utility must pay to hold a field free from competition.
3. The highest type of service may best be obtained through a single agency.
4. Utility rates should be adjusted to fit the quality of the service rendered.
5. Security issues should be so regulated as to render the utility financially able to meet all reasonable demands for service improvements.
6. Every utility must make such extensions or provide such additions as may be reasonably required so far as its rates will enable it to earn a fair return upon its property.
7. A utility with limited product must be restricted in its operation to the area in which it can render adequate service.
8. Every utility must extend the use of its facilities to any other utility to perform a service which the first utility is, itself, not able to perform.
9. Utility service regulations must combine a maximum of convenience to the public with a maximum degree of protection to the utility.
10. The first consideration in utility service must be safety.

Steam Railroad Investments for Six Years

From 1908 to 1913, inclusive, the steam railroads in the United States with annual operating revenues of more than $1,000,000 invested in their road and equipment cash to the amount of $4,010,385,303. These railroads include about 90 per cent of the mileage, receive more than 96 per cent of the revenues and handle more than 98 per cent of the traffic. The cash investment of the operating railroads of the Eastern district was greater than the amount of capital securities issued by them during this period, and was 19.9 per cent of the aggregate of their capital securities outstanding June 30, 1913; of the railways of the Southern district it was 21.1 per cent, and of the railways of the Western district it was 23.2 per cent of the aggregate of their capital securities outstanding June 30, 1913. That is, the cash actually expended by these railways during the last six years upon their properties used in transportation amounts to more than one-fifth of their total capitalization at the close of the last fiscal year. These figures are obtained through an original compilation made by the Bureau of Railway Economics from the reports made to the Interstate Commerce Commission.

The Saxony State Railway has decided to begin work on the electrification of its system. The first section to be converted will be that between Klingenthal and Untersachsenberg, after which the Pirna-Dresden-Meissen line may be taken in hand.

Estimating the Cost

The Writer Describes the Steps to Be Pursued in Making Different Kinds of Estimates with Special Reference to Correct Accounting for Replacements and Improvements

BY HOWARD H. GEORGE, ASSISTANT ENGINEER MAINTENANCE OF WAY PUBLIC SERVICE RAILWAY, NEWARK, N. J.

Broadly speaking, engineering estimates may be classed under four different headings as follows:

1. Preliminary estimates of work to be done, based upon general assumptions or upon a rough reconnaissance on the ground.
2. Detailed estimates of work to be done based upon quantities obtained from accurate plans, cross-sections, profiles, detailed surveys, etc.
3. Estimates of the original construction cost of work done at some more or less remote time, under conditions not definitely known to the estimator.
4. Monthly or other periodical estimates of work which has been completed on any contract, upon which the contractor is to be paid.

PRELIMINARY ESTIMATES

Referring to those coming under the first group, during the last three or four years that the writer has been making bridge and track estimates on the property with which he has been connected, he has frequently been called upon for an "approximate estimate" of what certain track or other work would cost. Very often but little or no time is available for even a preliminary investigation, and in such cases it becomes necessary to make many rough and hasty assumptions as to requirements upon which to base the estimate. Possibly a proposition involving a track extension may be brought up for the consideration of a railway company's officials, and their engineer is called on for a preliminary estimate of the cost. Of course, having a thorough knowledge of the physical conditions existing over the entire property is of very material assistance in cases of this kind, but there are so many factors which must be taken into consideration in the preparation of such a preliminary estimate that it is not reasonable to expect the engineer to do himself justice under such conditions.

Suppose, for example, we assume as typical the case mentioned above of a track extension. First comes the question of the length of line, which, when scaled from atlases, blueprints of maps, geological sheets, etc., is often unreliable. Then there is the question of headway which will probably be required to properly provide for the traffic, so that the need for double or single track may be determined. Then, where such extensions intersect other existing lines, you must consider what special connecting curves will be required to permit a possible flexible operation over the new track. Incidentally it might be noted that very often, especially where such new track is built in the heart of a city, the item for special work frequently forms a very large proportion of the total cost of the work and may greatly increase the "per foot" cost of the track.

Another important item which must be taken into account is that of probable municipal requirements as to paving, type of rail which will be required and whether the use of steel or wooden poles will be permitted. Where the extension is to be constructed on paved city streets, a knowledge should also be had of the character of the paving to be torn up. It is obvious that where granite block pavement laid on a concrete base has been grouted with a cement filler so strong that half the blocks break while trying to remove them, the cost of opening up a trench for the track will be much more than would have been the case if the granite block had been laid on a dirt foundation with sand joints. In the case of interurban construction on private right-of-way, we must take into consideration the probable amount of excavation and its nature. It must be admitted that an estimate based on the assumption that only ordinary earth or gravel will be met will not go very far if it is later discovered that underlying the top strata of gravel is rock to the extent of 25 per cent or more of the total excavation.

Another very important item which must be provided for is feeder. The size, of course, is largely fixed by the number and type of cars to be operated over the line, by the length of line, its distance from the power house and by the permissible drop in voltage. It may be that it will not be necessary to run additional feeder all the way from the power house, but experience has shown that this is not a safe assumption to make.

One other factor of no less importance which, especially in the case of interurban construction, very often runs into a considerably large amount, is that of bridges, culverts, viaducts, etc. This must also be considered in the case of track to be built over existing structures in order to determine to what extent such structures must be strengthened or whether they must be entirely rebuilt.

Many more specific items might be mentioned, all of which may have a more or less important bearing on the estimate, but occasionally less time is given the engineer to prepare his preliminary estimate than it has taken to state the considerations just noted. The fairness of the statement that under such conditions it is not practicable for an estimator to do himself justice must therefore be acknowledged, and it is certainly not fair to any company to be obliged to use such figures as a basis for the approval or rejection of any proposition and certainly not for the purpose of making an appropriation actually to do the work.

The first two or three times an engineer is called on for such an "approximate estimate" he is very liable to figure low. He may even fail to consider one or more of the items mentioned, as he is apt to learn when called upon to explain the reasons for large excesses when the work has been completed. He is soon forced to realize that but little or no credit is given him. although he may deserve it, when his authorizations show a favorable balance upon their completion. On the other hand, he comes in for some sharp criticism or even censure if the sheets show an excess. Either way he is apt to be labeled as a poor estimator. As a result of such experience he is apt either to figure his unit costs high, figure higher on estimated quantities or include an unnecessarily large contingency item in order to protect himself against those items which he cannot determine in his preliminary investigation but which must be taken care of when the work is done. Naturally, of the two evils, he would prefer to be able to show a cost of construction less than his estimate rather than in excess of it.

What is the result of this necessity for accuracy on the part of the engineer? Looking at the question from the company's standpoint it very frequently proves true that when the work is approved, much more money is appropriated than is necessary. This is undesirable because interest must be paid on all money borrowed for such improvements or extensions. Further, such inaccurate estimates add an extra burden on the company, which in many cases could have been eliminated had ample time been allowed for the preparation of a more accurate estimate. Or, looking at the question from another angle, such excess appropriation might have been devoted to other badly needed improvements which were cut out of the annual budget because sufficient funds were not available. From the standpoint of the engineer, he is discredited when he is obliged to come back with a request for more money to finish a job, no matter how small the amount may be or what the reason.

The above should not be construed as a plea for obviously incompetent estimators or engineers, but is rather a statement of facts regarding conditions which actually exist on almost every railway property, and against which, I believe, almost every engineer has to contend more or less frequently. Some one has defined the word "Estimate" as "a scientific guess." It is certainly true that in the case of estimates prepared under such conditions, other qualifications remaining the same, a good guesser will often make the best estimator, and it is a wonder that estimates agree as closely with the actual cost and as many times as they do. During the writer's connection with the estimating branch of the work, estimates have been prepared on a great many bridge and track propositions, both on new and reconstruction work, covering both very large and very small amounts. Opportunity has also been available for comparing the actual costs with the estimated costs on every piece of work done. In some exceptional cases the difference has been as much as 15 per cent but in many others less than 1 per cent, on the average the variation being considerably less than 10 per cent, and it is generally conceded that it is not practical for an engineer to consistently estimate closer than this latter figure on work of this character.

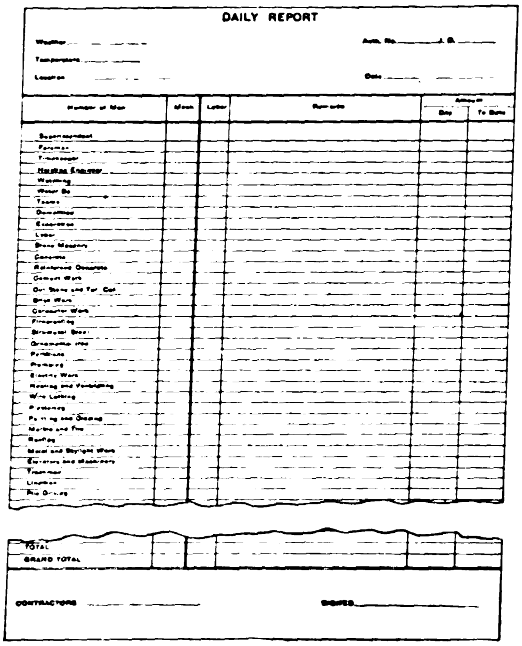
ESTIMATING THE COST—FIG. 1—FORM FOR DETAILED ESTIMATE AND AUDITOR'S STICKER



DAILY REPORT

ESTIMATING THE COST—FIG. 2—RECORD KEPT BY BUILDING INSPECTORS

In Group 2, detailed estimates, there are, of course, fewer chances for the engineer to go so far astray. However, weather conditions, strikes, etc., will naturally play an important part in affecting costs. Another factor is that much time may elapse between the preparation of the estimate and the actual performance of the work, during which time the prices of both labor and material may fluctuate greatly. But even in estimates based upon accurate detailed plans and surveys and known material costs, we are still obliged to tack on an arbitrary percentage to cover engineering, legal expenses, contingencies and such items as may cover a "multitude of sins." For this reason it is neither necessary nor advisable to try to split hairs too finely in the preparation of estimates of any character.

ESTIMATES OF ORIGINAL COST

The most trouble is given by Group 3, estimates of original construction cost. On reconstruction work it is not only necessary to figure on the cost of doing the required amount of work but also to prepare an estimate of the original construction cost of the work proposed for reconstruction. This detailed information is required by the auditor for properly classifying the proposed expenditure into the various construction, depreciation and operating accounts. Where such reconstruction is complete, this figure represents the amount at which such track or other structure was originally capitalized and which must be written off the books when it is replaced. In the case of only a partial replacement, or where such reconstruction is done with part of the materials from the old structure, the same data are necessary for the determination of operating expenses. Since work is seldom done exactly as originally estimated on, any preliminary estimate of the original construction value could not properly be used for the purpose of a final classification of the amount actually spent. Hence it is necessary to keep an accurate record during the progress of such reconstruction work of all old materials reused as well as of all new materials used. On the Public Service Railway this record is made in each division during the working season by an inspector of track construction whose duties include a daily visit to every job in his territory. In order to make his records as accurate as possible each inspector receives explicit instructions as to what records he must keep. Before work is started the street is stationed off, and it is to these stations that the inspector refers for his distances and other identifying data.

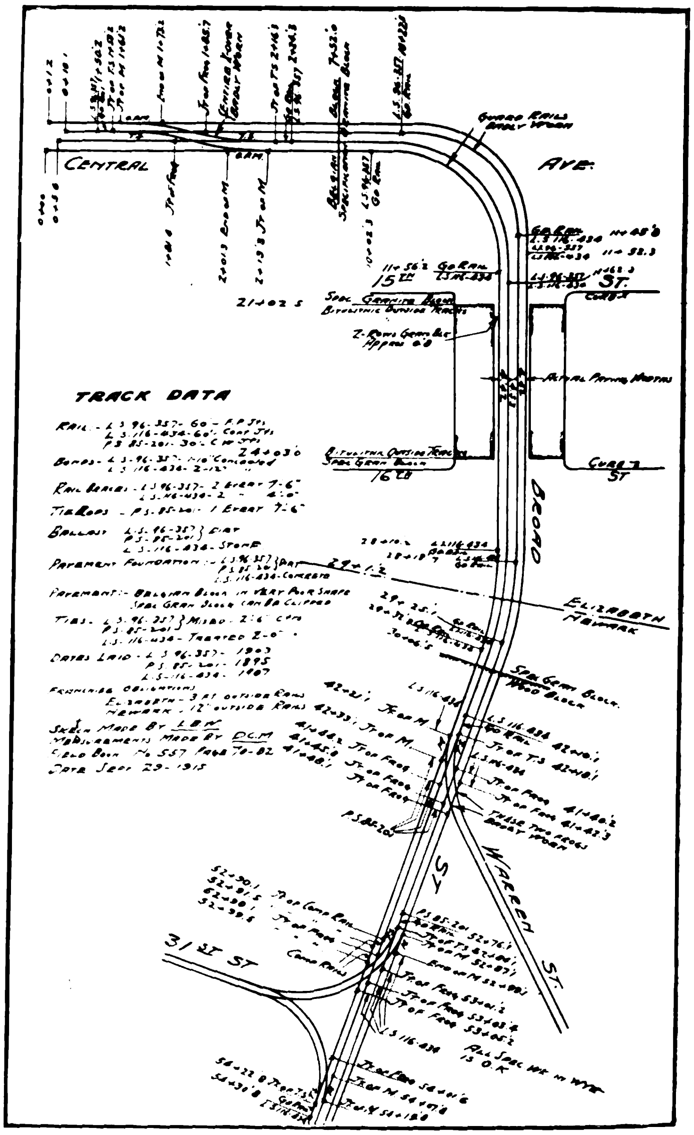
The general auditor supplies the engineering department with a detailed statement upon the completion of a job, showing every charge that has been made against the authorization, as well as all credits which may have been applied to it. A complete report is also made out by the division engineer from the data collected by his inspector, which, together with a sketch, is submitted to the engineer of maintenance of way. From this information a final revised estimate is then prepared to show not only a detailed classification of the actual cost but also a revised estimate of the original construction cost of the work which was actually replaced. It may seem to some that such care is not necessary, but in these days of frequent audits of a railway company's books by outside expert accountants and the more exacting requirements of the various governing commissions, it is not only very desirable, but also essential that great care be taken to secure the most accurate figures practicable and to avoid discrepancies. This shows the need for an accurate adjustment of all figures affected by even a slight departure from the type or extent of the reconstruction originally estimated on. Even in the installation of an entirely new cross-over at a location where none previously existed, which was formerly considered as a purely construction charge, the value of the rail and other material which the special work replaces must now be written off, and a scrap credit for the same be applied to the authorization.

If, in preparing the final revised estimate, the engineer finds any marked discrepancies between the division engineer's reports and the detailed statement of the actual charges submitted by the general auditor, such, for example, as more ties or rail being charged against the work than the measurements show could possibly have been used, he then has both records checked and an investigation made to determine whether or not some material might have been taken away for use on some other job and no credit applied. If no agreement can be reached in this way, he personally has a check measurement made of the entire completed job, upon which the revised estimate is then based. There is, however, little occasion to resort to this extreme.

It frequently happens that the old track or other structure has been built so long that no records are available as to its actual cost, in which case other methods must be resorted to. Much valuable information may often be obtained through consultation with old track foremen, roadmasters or other officials of the maintenance of way department who have been in charge of track construction work, and advantage taken of their personal knowledge of labor and material prices which were obtainable when a large part of the older track was originally constructed, as well as details of construction and methods of doing the work. By following out such a method, the estimates of the original cost of track to be reconstructed will be much more accurate than would otherwise be possible. This has been the practice of our estimating department in the preparation of estimates coming under this group, with very good results.

For a final record, both the original estimate and the final revised estimate, the division engineer's report with sketch, and the general auditor's detailed statement of the charges comprising the total cost of the work are then filed with the auditing department. The inauguration of this system will in later years prove of inestimable value to the engineers who will then be called on to give the original construction cost of any of the track or other structures which we are now building or reconstructing, as they will thus have the actual value at which such structure was capitalized together with a complete detail as to its type of construction.

It has been the practice of our Estimating Department to keep in close touch with the Storekeeper and the Auditing Department, so as to be thoroughly familiar with the current prices of all materials which we carry in our stores. In this respect it has also been our practice to carefully read that section of the *Engineering News* devoted to the current market prices of the principal structural materials. All such cost data, together with their dates, are carefully filed alphabetically in a loose-leaf note book, the size of which will permit of its being carried around in one's pocket. The alphabetical arrangement greatly facilitates the work of finding the material in question. As this "dope" becomes obsolete, it is brought up to date with other more recent figures as soon as the same can be obtained. The allowance for labor is generally based upon actual observations of labor costs on work recently performed under as nearly as possible similar conditions. For the purpose of quick estimating on special work lay-outs, where time is not available for the preparation of a large-scale drawing, we keep a loose-leaf book with small scale drawings of every piece of special work which we purchase. On each sheet is typewritten, along with other data, the kind of rail, type of construction, date purchased and cost of the



ESTIMATING THE COST—FIG. 3—DIVISION ENGINEER'S REPORT USED AS BASIS OF FINAL REVISED ESTIMATE lay-out. Thus an estimate becomes simply a matter of picking out a lay-out conforming as nearly as possible to the one under consideration. At first thought, it might seem that this search would take much time, but the estimator soon learns such a book practically by heart and selects the required lay-out with little or no difficulty.

PERIODICAL ESTIMATES

Little need be said regarding the monthly or periodical estimates coming under the last group, 4. These estimates are based upon actual measurements (generally made at the end of each month) of the work as completed at that time. Since such measurements are generally made in the presence of a representative of the contractor, but little opportunity should arise for any dispute because the unit prices are fixed by contract. The only chance for any difference of opinion is in settling claims as to allowance to be made for extras or force account work. Where the practice is strictly adhered to of allowing no extras or force accounts except where the engineer's written orders have been obtained to cover same, and the price agreed upon at the time, this part of the work is very much simplified.

ESTIMATING THE COST—FIG. 4—MONTHLY ESTIMATES OF AMOUNTS DUE TO CONTRACTORS FOR WORK PERFORMED

Fig. 1 shows the blank form used by our engineering department for the preparation of detailed track estimates. The last two columns of Fig. 1 show another blank form, one edge of which is gummed so that it can be attached to the right hand edge of the form shown. These last two columns are filled out by the general auditor's department and show the classification of the cost of each item entering into the work. Fig. 2 shows another blank form used by the building inspectors for the purpose of keeping a daily record of the men employed on various classes of work, etc. The sketch shown in Fig. 3 is one submitted by the division engineer with his report and it is principally upon this information that our final revised estimates are based. mates due to contractors for work performed.

The United Railroads of San Francisco are making a test of a rebuilt low-entrance car. The car has been in service about two months, and after the test is completed the company will probably place an order for new equipment and controllers for low-entrance cars.

Recent Tendencies in Valuation

The recent tendencies in valuations for rate-making purposes is the subject of an article by Edwin Gruhl, assistant to the president, The North American Company, published in the issue for May of *The Annals* of the American Academy of Political and Social Science. From numerous cases decided by courts and commissions during the latter part of 1912 and 1913, Mr. Gruhl summarizes the significant changes thus:

1. When appraisals of the cost of reproduction new are considered in determining the present value for rate-making purposes, experience has proven the necessity of making more liberal additions for overhead percentages, not to cover mere conjectural values, but to include costs which do not appear in the appraiser's inventory.

2. When the present value for rate-making purposes is based upon the cost of reproduction new, deduction may properly be made for the depreciation in value. The amount of such deduction, however, may vary with the care with which the owners of the property or corporation have provided against such depreciation. There is a tendency to measure the deduction by inspection rather than by theoretical estimates of expired life. Where the owners of the property or corporation have given evidence of their responsibility to replace depreciated property, such fact may be taken into consideration in determining value for rate-making purposes. Likewise the reserve accrued by the owners of the property or corporation to offset depreciation is properly considered an asset of the utility for rate-making purposes.

3. Where the cost of reproduction new is determined, inclusion is properly made for the cost of repaving over mains, even though it has not been necessary for the utility to disturb such paving during the course of construction.

4. Where the present value for rate-making purposes is determined, inclusion must be made for appreciation as well as depreciation of real estate. It does not seem proper that any portion of such appreciation should be construed as income upon which dividends or taxes may be paid. With few exceptions the recent proposal to deduct the so-called "unearned increment" from the value for rate-making purposes upon the theory of a relation of "principal and agent" is dissented from upon the ground that such a policy would carry with it the necessity of underwriting past losses. As yet no attempt has evidently been made to apply this principle in practice.

5. There has been a reiteration and elaboration of the necessity of including going concern value in the present value for rate-making purposes.

Judgment in Canadian Case

The Privy Council in London, England, delivered judgment on June 26 in the case of the British Columbia Electric Railway versus the Vancouver Railway & Navigation Company. The issue was whether the Dominion Railway Board had jurisdiction to direct the appellants to pay part of the cost of bridges over certain streets in Vancouver. The Privy Council, allowing the appeal, said that if the board possessed any such jurisdiction it must be derived from the statutes which created it. A fundamental error underlying the decision of the Railway Board was that it had considered that the fact that the tramway company would be benefited by the works gave it jurisdiction to make the company pay part of the cost. There is nothing in the railway act which gives the board any such jurisdiction.

The Present Status of Prime Movers

The Report of the A. I. E. E. Committee on Prime Movers Showed Remarkable Progress in the Thermal Efficiency of the Steam Turbines—The Reasons for This Are Brought Out in the Following Abstract

At the annual convention of the American Institute of Electrical Engineers held in Detroit, June 22 to 26, H. G. Stott, R. J. S. Pigott, and W. S. Gorsuch presented a paper on the present status of prime movers as the report of the committee of which Mr. Stott is chairman. The committee had selected the following subdivisions of the subject in order to cover the most important recent developments in the field of prime movers: reciprocating steam engines; steam turbines; gas engines; oil engines; hydraulic turbines, and finance and economics. The purpose of the paper was to bring out in a concise form the present status of heat engines and hydraulic turbines, and the various types were compared as to relative importance, capacity, efficiency, weight, cost and economy. The paper is the result of a very extensive research, and the results were presented in tabular and graphical form and they were thoroughly discussed.

It appears from the report that the reciprocating steam engine has become practically obsolete for use in modern power stations. In the large new central stations this engine is not even considered, but in small isolated stations it is still in use, especially where heating service is also handled. In small sizes the engine still has some advantage in economy over the small turbine, but the margin is becoming continually smaller, some of the latest geared units being almost on equal terms. The superior reliability, low maintenance cost, sustained original economy, and low attendance cost of the turbine generally overbalance the rather doubtful advantage in original economy of the small reciprocating engine.

STEAM TURBINES

In comparing the steam turbine with other prime movers the following points were considered: capacity, efficiency, weight and price. The authors state that the use of steam consumption or water rate per kilowatt hour is very unsatisfactory in connection with the efficiency of a steam turbine. Unless the steam and vacuum conditions are stated, the water rate means nothing. They recommend the "efficiency ratio," which is the ratio of the water rate of a perfect engine, that is, one working on a perfect Rankine cycle, to the water rate of the actual turbine working under the same thermal conditions. This ratio increases with size, superheat, reduction of vacuum down to about 26 in., and reduction of pressure. Speed also affects it, either to increase or decrease it, depending upon the design and conditions. Thermal efficiency increases with pressure, superheat and vacuum. It is possible that the turbine having the best water rates may not have the highest efficiency ratio. A chart given with the report shows that the efficiency ratio of a very large turbine may be over 70 per cent, the corresponding thermal efficiency being about 23 per cent.

The report showed that the weight of the steam turbine increases with increase of vacuum, decrease of speed, decrease of initial pressure and increase of efficiency ratio. The reasons for these increases are as follows: Increase of vacuum increases the size of the exhaust end and of the blading; decrease of speed results in the enlargement of dimension in every direction and sometimes increases the number of stages for a given efficiency; increase in efficiency ratio usually implies sharper blade angles, more stages and larger blading.

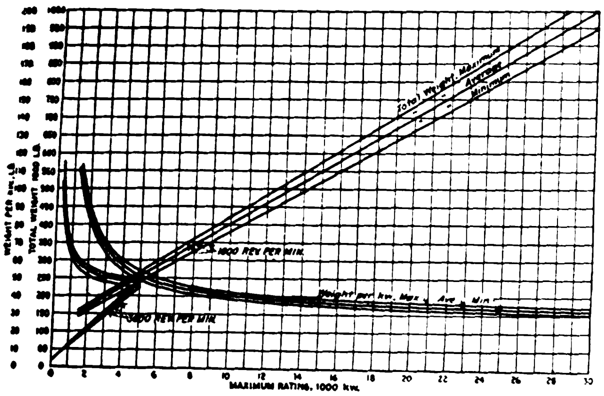
Turbine design is usually a compromise between cost of manufacture and efficiency. The cost is influenced by steam conditions and speed as well as to some extent by type. Increased thermal efficiency means increased cost. The curves given in the reports showed that average cost per kilowatt for the 3600 r.p.m. turbine varies from about $10.25 for a 2000-kw machine to somewhat less than $9 for a 5000-kw machine, the largest size now built. The average cost for the 1800-r.p.m. turbine varies from $14 for the 4000-kw machine to about $7 for the 30,000-kw machine. These figures are for sixty-cycle, maximum twenty-four-hour rating at 50 deg. Cent. rise, power factor 80 per cent, pressure 175 lb., superheat 100 deg. Fahr., vacuum 28½ in. Twenty-five-cycle machines cost from 15 per cent more in smaller sizes to 10 per cent more in larger sizes. Cost per pound remains about constant for a given capacity.

The three items which influence the purchasing of a turbine are price, water rate and time of delivery.

GAS ENGINES

The committee outlined the fundamental situation in regard to the gas engine following the same general subdivisions as in the preceding case. In comparing steam turbines and engine ratings with those of the gas engine attention is called to the fact that the former are such that the machines are worked under the most economical load at the rating of the electric generators. With gas engines, on the other hand, the efficiency increases with the load beyond the capacity of the engine, and for this reason the rating of the engine is generally made as nearly as possible its maximum capacity, allowing from 10 to 20 per cent for overload. The gas engine does not possess inherent capacity for overload in the same sense that the steam turbine and engine do, hence whatever overload it has is allowed by the manufacturer. The maximum capacity of a gas engine is reached when the cylinder has taken a full charge of mixture of the highest heat value and density. The engine must therefore accommodate itself to variations in the quality of gas. As the gas engine is somewhat limited as to the power which can be produced in a single unit, there has developed on the part of some manufacturers a disposition to increase speed. While high speeds have been used in steam turbine and engine practice this should not be taken as a criterion in gas engine work, for the action of the heavy masses involved in the reciprocating parts of the gas engine may become destructive and the result may be higher maintenance cost.

A characteristic of the gas engine, which other heat engines do not possess, is that the thermal efficiency remains fairly uniform over all ranges of sizes. The committee believes that under conditions generally met with in large gas engines a thermal efficiency of 25.2 per cent on the basis of brake horse-power, or 23.8 per cent on the basis of kilowatt-hours generated at full load rating are about what is to be expected. The range of fuel consumption, as guaranteed by American manufacturers with different fuels, varies from 9500 to 13,500 B.t.u. per brake hp for producer gas and 8500 to 15,000 B.t.u. per brake hp for natural gas. The



PRIME MOVERS—TOTAL WEIGHT AND WEIGHT PER KW OF STEAM TURBINES (60 CYCLES, MAX. 24-HR. RATING, 50 DEG. CENT. RISE, 80 PER CENT POWER FACTOR, PRESS. 175 LB. PER SQ. IN., SUPERHEAT 100 DEG. F., VACUUM, 28.5 IN.)

corresponding kw-hr. figures are 13,500 to 19,200 B.t.u. per kw-hr. and 12,200 to 21,400 respectively. Blast furnace gas runs in the neighborhood of 10,500 B.t.u. per brake hp-hr. or 15,000 B.t.u. per kw-hr. generated.

The operation of a gas engine involves high temperatures and pressures suddenly applied to the working parts, consequently this class of prime mover is inherently massive. The average weight per kw-hr. capacity was shown in the report to vary from 500 lb. for a 200-kw engine to slightly more than 740 lb. for a 1500-kw engine. The large unit weighs more than the smaller one for the reason that as size increases the stroke is lengthened and the weight is correspondingly greater per unit of capacity. This weight is governed by many considerations, such as rotative speed, mean effective pressure and other considerations.

On account of the heavy parts made necessary by high temperatures and pressures the gas engine is considerably more expensive to build than steam turbines or steam engines. The report showed that the average cost per pound for tandem and twin tandem engines of the horizontal type, using producer gas and natural gas, directly connected to sixty-cycle generators of from 200 to 1500-kw capacity at 80 per cent power factor, varies from about 16 cents to less than 10 cents. The corresponding average cost per kilowatt of capacity varies from $79 to less than $72. Many attempts have been made to lower the cost of the gas engine by decreasing its weight without impairing its reliability, and to increase its capacity by increasing the pressure of the charge and simultaneously scavenging of the exhaust gases, but all without definite results.

OIL ENGINES

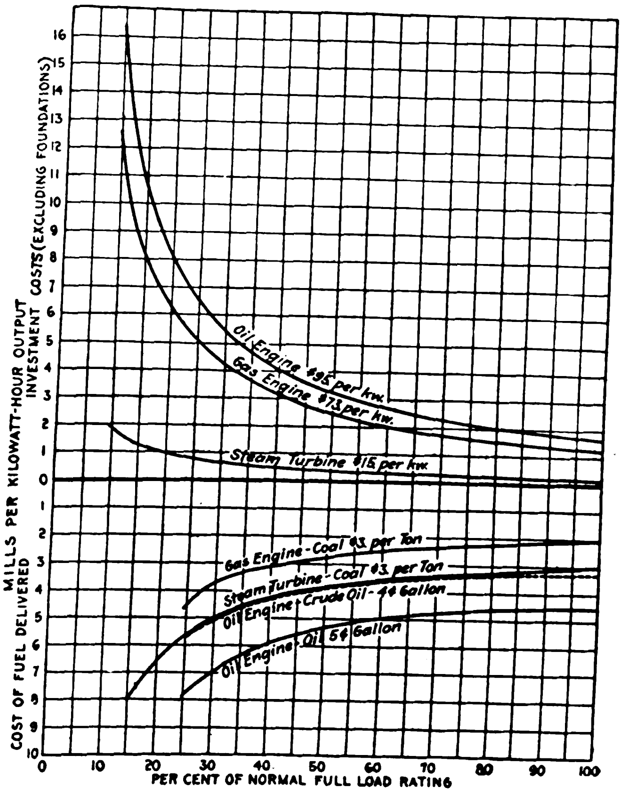
While oil engines have progressed rather slowly in this country the development has been more marked in Europe, especially since the expiration of the basic Diesel patent in 1912. The Diesel engine is essentially a vertical type, but while tests show that fuel consumption in the horizontal type is slightly higher than in the vertical type, many manufacturers have begun to build the horizontal type on account of its greater simplicity and accessibility and lower cost. There are approximately 300 installations of medium and heavy-duty oil engines, aggregating in capacity over 75,000 hp in operation in the United States.

Like the gas engine the oil engine does not possess an inherent overload capacity in the same sense that the steam turbine does, hence whatever overload is required must be provided by the manufacturer. The oil engine is restricted in size for the same reason as is the gas engine. The largest Diesel engine operating in this country is a 450 brake hp, double unit of the vertical, four-cycle, three-cylinder type, although in Europe they have been built as large as 2500 brake hp. There has been recently built in Germany a 2000 brake hp horizontal double-acting, four-cycle, twin standard Diesel engine operating with tar oil which promises interesting results.

The thermal efficiency of the oil engine varies slightly with capacity but, unlike the gas engine, the thermal efficiency does not increase with the load beyond the capacity of the engine. Figures of efficiency have been given that cannot be substantiated. With oil having 19,000 B.t.u. per lb. the thermal efficiency and fuel consumption that may be expected at different percentages of load are about as follows, no allowance being made for auxiliaries: thermal efficiency at quarter load, 16 per cent; at half load, 24 per cent; at 0.9 load, 28 per cent; at full load, 28¼ per cent: fuel consumption at quarter load, 1.1 lb.; at half load, 0.76 lb.; at 0.9 load, 0.65 lb., and at full load, 0.64 lb. These figures are for the vertical Diesel engine, four-cycle, three and six cylinders, directly connected to sixty-cycle generators, with oil having 19,000 B.t.u. per lb. The fuel consumption of the best oil engines to-day, made in large sizes, varies from 0.4 to 0.5 lb. per brake hp, the highest fuel economy being attained with the four-cycle type.

The Diesel engine is inherently massive for the same reason as the gas engine and the weight per unit of capacity increases with the size. The report showed that engines of the type mentioned above vary in weight per kw from 500 lb. at 40 kw to 750 lb. at 350 kw, the corresponding total weights being 20,000 and 260,000 lb.

There have been so few oil engines, driving generators of any appreciable size, installed in this country that it is difficult to tabulate cost. The most reliable figures available average approximately $95 per kw installed, including engine and generator complete, but not the foundation, within 600 miles of the factory. This corresponds to a cost per pound of about 19 cents for the 40-kw engine to 12.6 cents for the 400-kw.

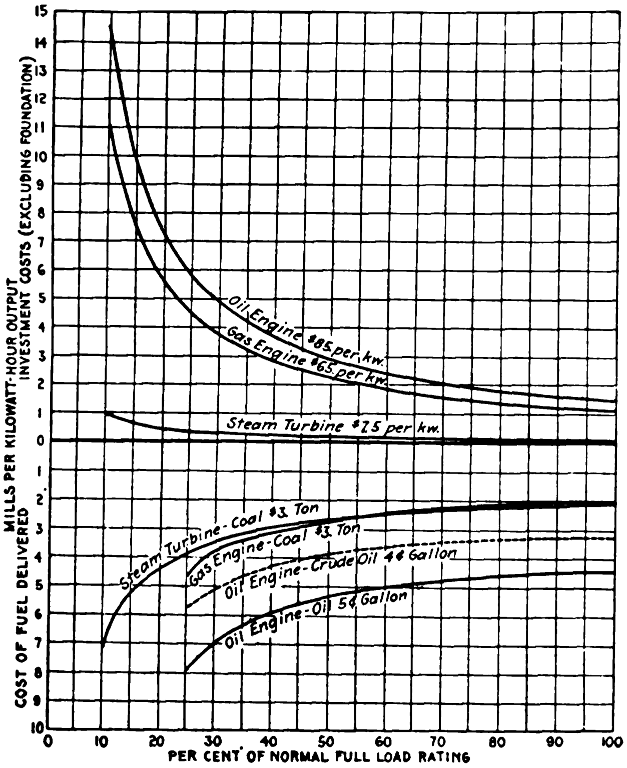


PRIME MOVERS—RELATIVE INVESTMENT AND FUEL COSTS OF 750-KW STEAM TURBINE, GAS ENGINE AND OIL ENGINE (INCLUDING D.C. GENERATOR)

High-compression, Diesel-cycle, crude-oil engines of the two and four-cycle, single and twin cylinder, horizontal type, using a heavy grade of crude oil, are now being manufactured in America as large as 500-hp capacity. They are somewhat heavier per kw capacity than the Diesel engine.

HYDRAULIC TURBINES

The demand on turbine designers and manufacturers for increased efficiency has been met by the production of turbines which, under test conditions, have given efficiencies of 90 per cent or over. These high efficiencies can now be maintained through considerable variations of head and power. Since 1911 the trend has been toward the adoption of single-runner, vertical-shaft turbines for low and medium heads. This change in type of unit is due to the recent progress in the design and development of high capacity runners and the improvement in thrust bearings.



PRIME MOVERS—RELATIVE INVESTMENT AND FUEL COSTS OF 20,000-KW CAPACITY OF PRIME MOVERS WITH GENERATORS

The weights and cost of hydraulic prime movers are not strictly comparable with those of the steam turbine, gas and oil engine because the conditions are quite variable, involving head; kind of flume, open or closed; setting, vertical or horizontal, single or multiple; material in runner, etc. With a given head the greater the power of the turbine the less the unit cost. With a given head and power, the higher the speed the less the unit cost. On the other hand with a given power, the lower the head the greater the unit cost. In general the cost of hydraulic turbines and generators, larger than 200-kw capacity, varies from $30 to $10 per kw installed, exclusive of foundation.

FINANCE AND ECONOMICS

Under this head the report took up the various types of prime movers from the standpoint of investment and fuel cost stating that, in comparing the various types of prime movers, conclusions are often reached largely from a study of the cost of fuel, without any reference to the total cost of power and the relative investment cost. The impression that gas and oil power invariably imply a lower cost of generation is constantly losing ground through the critical analysis of the elements of power cost.

The committee worked out the investment and fuel costs for a 20,000-kw plant equipped with one 20,000-kw steam turbine, ten 2000-kw gas engines, or forty 500-kw oil engines. Basing the estimate on the cost given earlier in the report and on the cost of coal as $3 per ton, crude oil as 4 cents per gallon, and oil for the Diesel engine as 5 cents per gallon, the steam engine was shown to be not only cheaper, as far as investment is concerned, but also superior in fuel cost to the crude oil engine. Above half load the gas engine is more economical in fuel, while the oil engine is less economical than the steam turbine. Below half load the steam turbine is best of all. The committee states that from a study of the curves it will be seen that the ratio of cost of steam to gas and oil units is decidedly in favor of the former so that gas and oil power comes to be really handicapped in large work owing to the proportionately greater investment burden. Unless the price of coal rises materially above the present value the gas and oil engine will find limited applications in any appreciable size, except under very favorable circumstances, where natural gas, by-product gas or some artificial fuel oil can be secured at low prices. If the maintenance cost and the additional investment cost required to show reliability or continuity of service are excluded, the steam turbine will stand out more prominently.

The redeeming feature of the water turbine is shown to be the absence of fuel. As a result the operating expenses are practically the same whether the plant is working 10 or 24 hours per day. On the other hand, the investment cost is influenced by the load factor, but it is doubtful in any case whether the water turbine and generator will exceed twice that of the steam turbine and generator on the basis of 11 per cent allowance for interest, taxes, insurance and amortization. When the investment cost can include an adequate supply of auxiliary capacity to supplement the deficiency in stream flow, the difference between the investment cost of prime movers plus the fuel cost, at any percentage of normal full load rating, will not be so marked. In fact, with the same class of service and the reliability charge in the form of duplication of units or steam reserve, the straight steam turbine units will in many cases be more economical. In low-price fuel districts the hydraulic turbine is only a competitor of the steam turbine where the development costs are moderate and the load factor reasonably high. The following table is given in the report summarizing the information as to total cost of investment and relative cost of prime movers and generators.

Prime Mover	Total Investment Cost Per Kw.	Cost of Prime Mover and Generator Per Kw.	Percentage of Total Investment
Steam turbine..............	$65.00	$7.50	15
Gas engine (producer gas)..	140.00	65.00	46.5
Oil engine	120.00	85.00	71
Hydraulic turbine	125.00	12.00	9.6

Summarizing the data contained in the report the committee points out the remarkable fact that the large steam turbine has now passed the gas engine in thermal efficiency, and the only prime mover surpassing it is the Diesel type of oil engine. Owing to the present limit in size of the Diesel type of engine, which seems to be about 1800 kw, the space occupied by engines in plants of capacity larger than 15,000 kw is excessive. The committee had not sufficient data to warrant a report on the subject of maintenance of these engines. The general conclusion is that the steam turbine is far more economical for power generation than any other type of heat engine.

Atlantic City Meeting of the American Society for Testing Materials

The seventeenth annual meeting of the American Society for Testing Materials was held at Atlantic City, N. J., June 30 to July 3. From the standpoint of the electric railway engineer the chief actions of interest were those relating to the recommendations of committee A-1 on standard specifications for steel. Certain changes in details of the specifications for steel rails, splice bars, structural steel, built-steel concrete reinforcing bars, steel forgings, heat-treated carbon steel axles, and a few others were referred to letter ballot.

Under the head of "Standard Specifications for Steel Forgings for Heat-Treated Carbon-Axles, Shafts and Similar Objects," the committee recommended that the present specifications be cancelled and a new set substituted under the title "Quenched-and-Tempered Carbon-Steel Axles, Shafts and Other Forgings for Locomotives and Cars." In addition to the change in title, the following other changes were recommended: The description of the heat treatment has been changed, as well as the sections on prolongations for tests; the section on warping has been omitted; requirements as to boring have been added; the manganese requirements have been changed; the maximum and minimum limits for carbon have been given; classification by sizes has been added; the ductility requirements are now based on the inverse ratio of the tensile strength, that is, factor ÷ tensile strength; the method of determining the "elastic limit" has been changed; section providing for proof tests of finished forgings has been added; the requirements as to number of tests have been changed; and requirements as to character of fracture and permissible requenching have been added to the section on retests. Attention was directed to the following: (1) That many sections in these specifications are the same as the corresponding ones in the specifications for carbon-steel and alloy-steel forgings; (2) that the tensile properties are the same as those of the corresponding class in the last-named specifications, and (3) that certain requirements have been included that are not covered in the last-named specifications.

As representatives of the American Electric Railway Engineering Association on committee A-1, Norman Litchfield, J. P. Barnes and W. E. Johnson filed a minority report on the subject of steel-axle specifications which did not affect the committee's recommendation. (See letter on page 78 from George L. Fowler.)

The committee's reason for its attitude toward the request of the representatives of the A. E. R. E. A. was that the proposed specifications were not considered practicable from a manufacturing standpoint. The minority report follows:

"As representatives of the American Electric Railway Engineering Association on committee A-1 on standard specifications for steel, and its sub-committee VI on steel forgings, we wish to protest against the action which the committee has taken in submitting to the society a proposed revision of the present standard specifications for heat-treated axles, shafts, and similar objects, without due consideration being given to the wishes of the American Electric Railway Engineering Association and before it could have the attention of that association at its annual meeting. The first specification covering this class of material was originated by one of the member companies of the American Electric Railway Engineering Association, and then adopted by that association, which later, at the solicitation of some of the members of the American Society for Testing Materials entered into joint consideration with that society in the production of the present standard specifications of the society entitled 'Specifications for Heat-Treated Axles, Shafts, and Similar Objects.' The specifications which committee A-1 now proposes are general, covering axles, shafts, and other forgings for locomotives and cars, and would consequently supersede the present specifications for heat-treated axles. To this the representatives of our association strongly objected in the meetings of sub-committee VI and committee A-1, as the requirement of the new specifications, while in some respects an improvement over those of the existing specifications, do not, in the main essentials, retain the high standard set by the original specifications, and particularly with reference to the elongation and reduction of area, required to be not less than 22 and 45 per cent respectively for all tensile strength above a minimum of 85,000 lb. per sq. in. It is proposed to place the elongation and reduction of area on a sliding scale basis, such that with a tensile strength of 85,000 lb., an elongation of 23.5 per cent is permitted as a minimum, with 91,000 lb., 22 per cent as a minimum, and with 97,000 lb., a minimum of 20.6 per cent as the ultimate limit is reached; and with the tensile strength of 85,000 lb. a minimum reduction of area of 44.7 per cent is permitted, with a tensile strength of 90,000 lb., a reduction of area of 42.2 per cent is permitted, scaling down to a minimum of 39.2 per cent for a tensile strength of 97,000 lb.; covering forgings of various sizes within the range of standard driving axles for electric railway work.

"While it is frankly admitted that in no instance will the minimum reduction requirements of the proposed specifications be as high as those of the present specifications, it is claimed by certain members of committee A-1 that the above arrangement should actually result in a higher minimum requirement for the elongation than that called for in the present specifications for this class of material. We do not agree with this contention, and base our opinion in this respect on experience which has shown us that even with the incentive to keep the tensile strength low in order to meet the elongation and reduction requirements of the present specifications, in the majority of cases the tensile strength exceeds 91,000 lb. per sq. in. Moreover, in the specifications as proposed, the tendency will be greatly in favor of a high tensile strength, as this will not only permit of a reduced elongation and reduction requirement, but will also result in a lower elastic ratio.

"After having submitted argument in favor of retaining practically the present physical properties and made motion to this effect, which was lost by negative vote of all members present at the meeting of committee A-1 held in Philadelphia on April 3 and 4, but without any explanation in support of action taken, or submitting any evidence to indicate that there was any reason for not supporting this motion, the representative of our association endeavored to have the title changed to read 'Specifications for Quenched-and Tempered Carbon Steel Axles, Shafts, and other Forgings for Locomotives and Trailer Axles for Cars,' in this way excluding electric motor driving axles and armature shafts. A motion to this effect was lost, notwithstanding the fact that the argument has been made that if it were defeated you were overruling the wishes of the originators of the specifications.

"The executive members of our association exceedingly deplore this action, feeling that as the specifications in question had been adopted by this society after being suggested by our association, and after co-operative consideration with this society, it should not be modified by you without direct consultation with the American Electric Railway Engineering Association, which is the engineering representation of the electric railway companies —extensive users of this material, for which these specifications are intended. Our executive members feel that such action cannot help but jeopardize the value of the co-operative work of the two societies."

Semi-Annual Meeting American Society of Heating and Ventilating Engineers

The summer meeting of the American Society of Heating and Ventilating Engineers was held at Hotel Hollenden, Cleveland, Ohio, July 9-11. Two papers of particular interest to electric railway men were "Car Ventilation," by D. I. Cooke, Chicago, and "Car Heating by Electricity and Temperature Regulation in Connection Therewith," by W. S. Hammond, Jr., Chicago.

CAR VENTILATION

Mr. Cooke's paper was largely taken up with a description of the tests on ventilation of street cars in Chicago, and the outcome of these tests in the equipment of a large number of cars with an exhaust system of ventilation. He first reviewed briefly the history of car ventilation, pointing out the defects of several of the methods used and outlined the tests made under the supervision of the health department of the city of Chicago, officials of the street railway company and the Board of Supervising Engineers, in 1908 and 1909. [These tests were described by Dr. W. A. Evans, Commissioner of Health, Chicago, in the issue of the ELECTRIC RAILWAY JOURNAL for May 8, 1909, page 876.] In Chicago the exhaust system of mechanical ventilation was adopted because it could be most readily applied to standard car construction.

Mr. Cooke stated that in Chicago the heating season is considered as 155 days per year. During this period the cars are operated with the doors and windows closed, and in winter with extra sash fitted in the windows. Mechanical ventilation has been recently applied to 125 of the single-end operated cars of the near-side type, operating on the lines of the Chicago City Railway. These cars were already in service and it was, therefore, deemed impracticable to install the standard system in which the air is drawn over the heating units from outside through inlets in the side of the car. The near-side cars were originally equipped with natural ventilators of the "aspirator" type located on the roof, with a series of openings through the car floor, to provide fresh air. In converting this system into a mechanical one six of the aspirators were changed into injectors, and the openings beneath the car heaters in the floor were closed. A motor-driven exhaust fan was placed beneath the end seat in the rear of the car, discharging downward through an opening in the floor. This fan had a capacity of 1000 cu. ft. per minute, and was driven at 2000 r.p.m. by a ½-hp motor.

In this installation at least one-half of the air comes through the roof injectors, the balance entering through leakage points, around doors, windows, etc. When the car stops, and the forward door is opened, the roof injectors cease to operate, but an ample supply of air is provided through the doors themselves. As a result of experience with this installation, Mr. Cooke believes that direct contact of air with the units of the heating system for the fresh air supply is not necessary, and he believes that the amount of heating surface for this kind of installation may be somewhat less than would be required in a direct-indirect system.

A mechanical exhaust system of car ventilation has been applied during the last two years in the double-deck cars which are being operated experimentally in New York, Rochester and Columbus. In these cars an exhaust chamber space is provided in the car roof in the upper deck with a cross section of 5 in. x 40 in. In the lower space of this exhaust chamber a series of 6 in. registers is provided to serve as air outlets from the upper deck section. The space between the seat backs in the upper deck forms the sides of a triangular duct of which the arch across the lower deck forms the bottom. This duct serves as an outlet from the lower deck section, and is connected with the main exhaust chamber in the upper deck roof by means of a riser at the mid-section. A series of outlet registers is also located in the lower deck roof, opening into the triangular duct. The main exhaust chamber in the upper deck roof terminates in the header at one end of the car body, to which in turn are connected four risers extending vertically downward along the window posts and having a cross section of 6 in. x 6 in. each. These vertical risers connect to a header in the roof in the lower deck and an exhaust fan motor is connected into it at the same point. Fresh air inlet connection is made to the car heaters in the lower deck section, and with the exhaust fan in service a circulation of air is established through the upper and lower deck compartments.

Mr. Cooke states that on account of investigations made by the Chicago commission on ventilation and others, the ventilation requirement in Chicago has been increased from 500 cu. ft. per minute to 1000 cu. ft. per minute. The average load is taken as eighty passengers, and to keep the carbon dioxide content of the air down to a maximum of twelve parts in 10,000 requires an equivalent of 750 cu. ft. per hour per passenger, or a total of 60,000 cu. ft. per hour per car.

ELECTRIC HEATING AND ELECTRIC HEATER CONTROL

In his paper on the above topic, W. S. Hammond, Jr., who is vice-president of the Consolidated Car Heating Company, first called attention to some of the fundamental facts regarding the transformation of electrical energy into heat. He stated that it requires about 20,000 B.t.u. per hour to properly heat a 20-ft. car body in the latitude of New York State in the coldest weather. Thirty per cent more heat is required for a steel car than for a wooden car of the same capacity.

In estimating the amount of heat required to maintain the desired temperature in a car, Mr. Hammond called attention to the fact that each passenger affects the temperature in a manner similar to a hot water radiator with a temperature, say, 38 deg. above the surrounding air, the temperature on the surface being the same as that on surface of the human body and the radiator surface being partly covered by cloth similar to clothing. Tests seem to show that the body of a man gives out twice as much heat as that of a woman. The amount of heat given off is proportional to the difference in temperature between the surrounding air and the body. Tests seem to show that the amount of heat given out on the average is from 198 to 400 B.t.u. per hour per person. A car which requires 10,000 B.t.u. per hour to maintain proper temperature can be heated by radiation from fifty passengers giving out 200 B.t.u. per hour each. This point has a practical bearing upon the heating of cars by means of electric heaters, for it shows that if heat is supplied to the car at a uniform rate the cars are overheated during those hours of the day when they are filled with passengers. Mr. Hammond's conclusion from these and other facts, on account of which it is difficult to heat cars uniformly, was that some kind of automatic control of the heating current should be provided.

Heat leaves a car by two routes, namely, one through the air which is replaced by fresh air for ventilating purposes, and the other through the windows and walls by conduction. Heat radiated in the latter way produces no ventilation, and tends to make the air in the car impure and cold. There should, therefore, be better heat insulation in the walls and ceilings of cars so as to stop as much as possible the loss of heat by conduction. Double windows are effective in providing dead air spaces through which heat will not be conducted readily. Double glazing of windows is known to save 33 per cent of the heat which would escape through single glazed windows. In the records of a test by a well-known authority the statement is made that in a building, 39 per cent of the heat escaped in the flues and 61 per cent in conduction through walls and windows. Because of that fact there would appear to be good reason for studying the problems of conduction through walls of cars to the end that this large loss of heat may be prevented. Mr. Hammond is of the opinion that, in heating cars, direct radiation should be provided to compensate for the heat losses through the walls and windows, amounting to about 60 per cent of the total heat, and that the remaining 40 per cent should be supplied by direct-indirect radiation, that is, by heaters exposed in the cars but receiving air from the outside. Air should be drawn into a car over the heating elements, preferably in small units. The source of power for causing the flow of air should be an exhaust fan operated by an electric motor.

In regard to the metals to be used in the construction of electric heaters, Mr. Hammond stated that as such wires as nichrome and the nickel-copper group have very low temperature coefficients their resistances are but slightly affected by changes of temperature. Therefore they give off heat at fixed rates, regardless of the temperature of the air surrounding the heaters. On the other hand, iron wire has a large temperature coefficient, and its resistance increases rapidly with rising temperature. As a result, an electric heater in which iron wire is used is in a certain sense automatic, the current increasing when the heater is supplied with cold air, and decreasing when the surrounding air is warmer, or when anything occurs which prevents the escape of heat.

In regard to the cost of heating cars, Mr. Hammond claims that the cost of energy to supply electric heat should be estimated on the basis of the additional cost of generating current to supply the heaters, but no charges should be made for such expenses as would continue the same if electric heaters were not used. With coal at $2 per ton he estimated this cost to be about 0.29 cent per kw-hr. At this rate, and basing the power consumption for heating on experience in Chicago, the maximum cost would be 2.12 cents per hour. The average is somewhat less than one-half this rate. Thermostatic control results in a considerable saving, which is specially marked when a railroad operates under peak-load-basis power contract. The period of peak load is that of crowded street cars, and on account of the extra heat from the bodies of passengers the thermostat tends to cut current off the heating system for the greater part of this time.

W. B. McKinley, president of the Illinois Traction System, has renewed this year his offer to the boys of the nineteenth Illinois Congressional district for prizes for the best corn raised in the district. Inasmuch as the United States department of agriculture is interesting boys in corn culture, Mr. McKinley has for several years supplemented the prizes of ribbons, which the government gives, with trips for the winners to various parts of the country. The first prize is a trip to the city of Washington, the second to St. Louis and the third to Springfield, Ill. The trip to Washington is valid while the conference of boy corn growers is in session. The expenses for all of these trips are borne by Mr. McKinley.

COMMUNICATIONS

The Question of Gear Ratios

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
EAST PITTSBURGH, PA., July 1, 1914.

To the Editors:

Referring to your editorial entitled "Again the Question of Gear Ratios" on page 1427 of the ELECTRIC RAILWAY JOURNAL for June 27, I beg to take exception to your inference that the comparison of equipments made in my paper before the Central Electric Railway Association is unfair and misleading.

It is generally impracticable for railway companies to adopt different sizes of motors, or even the same motors geared differently, for the two classes of service represented by purely city operation and combined city and suburban operation. The advantages of a single type of equipment and gear ratio for any one type of car are considered sufficient to outweigh the operating economies which may be secured by having the cars on each line provided with the equipment best suited to the service on that line and possibly to no other. Such conditions lead naturally to the selection of the equipment and gear ratio which constitute the best compromise.

Since such a situation demands a gear reduction of not more than 17:70 on the 310-C motors for the Toledo system, and since anything less than this reduction would increase the consumption of energy without producing any benefit, it is obvious that the field-control motor, to perform the same service most economically on the entire system, must meet two conditions as nearly as possible; first, it must propel the car at as high a free running speed as the ordinary motor and, second, it must not propel the car at a higher speed than the ordinary motor when developing heavy tractive efforts during acceleration.

It is impossible to make the speed-tractive effort curves identical on account of the different degrees of saturation in an ordinary motor and a field control motor. However, for a true comparison between the two types of equipment, the short field curve between car speed and tractive effort must be made as nearly coincident with that of the ordinary motor as possible. The field control motor on short field has a steeper curve. Therefore, the closest possible approximation to identical speed-tractive effort characteristics is secured when the field control equipment will propel the car faster than the ordinary equipment at low tractive efforts and somewhat slower at high tractive efforts.

There are three ways of obtaining this essential close similarity in characteristics: (1) By using motors with the same armature winding but geared differently; (2) by using motors with different armature windings but the same gearing; (3) by using motors with different armature windings and different gearing.

In my paper I stated clearly that the 310-C motors did not have the maximum possible gear reduction because of the fast schedules required on parts of certain lines with infrequent stops. I further stated that the 310-C-3 motor was geared so that the car speed on short field would be as nearly as possible the same as that of the car with 310-C motors. Fig. 3 in your abstract of the paper shows that on the level or grades of less than 0.75 per cent, the speed with field control is higher than without it. It is obvious, therefore, that the field control car is capable of maintaining the fast schedules necessary on those parts of lines with infrequent stops, which is one of the conditions to be met by any equipment applied to this system. Any economy resulting from the lower speed of the field control car at high tractive efforts is due to its steeper characteristic and is justly credited to the field control equipment in comparison with the ordinary equipment.

In the Toledo system, the two types of equipment were made equally suitable for maintaining all schedules by the first of the three methods cited above. For the sake of argument, let us suppose that it were feasible to equip the Long Belt cars with 310-C motors geared 15:72, and that such equipments would maintain the schedules on that line without reference to any other line. Such an equipment would undoubtedly reduce the energy consumption below that now required with 310-C motors geared 17:70. A comparable field control equipment would be obtained by either the second or third method cited above, and such an equipment would reduce the energy consumption below that of the 310-C motors geared 15:72 by the same percentage as shown by the tests.

I therefore maintain that the comparative economics shown by the tests are fair and truly indicate the value of field control equipments for the service condition of the Long Belt Line. F. E. WYNNE.

[The main points raised in the editorial in question were, first, that the ratio of 17:70 was not suitable for the particular run described, and, second, that, considered broadly, the result obtained with an improper ratio is not the best basis for comparison of the relative efficiencies of different equipments. Mr. Wynne admits the correctness of our first point. The second can hardly be disputed. As we said in the editorial in question, the tests described in Mr. Wynne's paper are interesting and the results are valuable. Our contention was simply that a too liberal application of the data might produce misleading conclusions.—EDS.]

The A. S. T. M. Specifications of Steel for Axles

NEW YORK, July 8, 1914.

To the Editors:

As a member of the American Electric Railway Engineering Association, it seems to me that the attention of the members of that association should be called to the action taken at the recent meeting of the American Society for Testing Materials in the matter of specifications for heat-treated carbon axles as applied to electric railway cars. The proposed specifications reduce the percentage of elongation and that of the reduction of area by a small amount from that now required by the standard specifications of the American Electric Railway Association.

A number of roads are working under these specifications (A. E. R. A.) and are satisfied with them. The committee of the American Electric Railway Engineering Association therefore sent a representative, W. E. Johnson, of the Brooklyn Rapid Transit Company, to the meeting to protest against the change. The reason for this was that if the elongation and reduction of area were kept as at present it would be necessary for the manufacturers to take more pains in the heat treatment of the axles than would be required were the percentages to be reduced in these particulars. Mr. Johnson, therefore, simply asked that the heading of the specifications be changed so as to except motor axles from the specifications and expressed entire willingness that they should be made to apply to trailing axles. The A. S. T. M. committee asserted that the old specifications were impossible commercially and that the proposed specifications would give the railroads a better axle. To this Mr. Johnson replied that axles were being bought under the old specifications without any trouble and that they were working satisfactorily. In spite of the protest, the Society for Testing Materials voted as a man, almost, to sustain the proposed specifications, and the suggestion from the A. E. R. A. was turned down with a thump.

Unable to understand this attitude, in view of the fact that at the same session the whole of the proposed specifications for automobile springs was cut out of the report because of the objections of the automobile manufacturers and that especial reference was made to the necessity of conforming to the views of the Master Car Builders' Association in the matter of things affecting the association, I took pains to discuss the matter with a number of members, and I found that the vote was cast, in most cases, without thinking, simply because it was the recommendation of the committee. There was no realization of the fact that the electric railway people were the users of the axles and that unless the specifications were satisfactory to them the axles would be of no value whatever. Even one of the officers of the association who is high in its councils made the same acknowledgment. He voted for the specification simply because he thought it a good one and because the committee recommended it.

I am not on the committee of the American Electric Railway Engineering Association which is concerned with axle specifications or even in its confidence and so do not know what action the members propose to take in the matter, but I feel that a direct affront has been offered to the representative of the association and take this means of bringing the matter to the attention of the members. GEORGE L. FOWLER.

Notes on Train Resistance Formulas

NEW YORK, July 7, 1914.

To the Editors:

I have read with interest in the ELECTRIC RAILWAY JOURNAL of June 20 the summary of the report on train resistance tests recently issued by the experiment station of the University of Illinois.

The new empirical formula derived from these tests presumably applies with satisfactory precision to cases and conditions similar to those of the tests. Usually, there is much variation in the values obtained in train resistance tests and it is difficult to obtain the same results twice. For this reason, it is usually considered useless to attempt to make the coefficients for the second and third terms very precise. It is only in the case of results which substantially repeat themselves and which are very closely concordant that one would usually venture to put more than one or two significant figures in the coefficients. It is hoped that the precision obtained in these tests justified the use of three significant figures; otherwise the formula is merely "putting on airs" and "traveling under false pretences," because it will not be as accurate as it looks.

It is known, of course, that a formula of this type does not tell the whole story, but ignores some of the incidents of train resistance. This is why it falls short of the requirements of a generalized rational formula. My views on this point are still substantially the same as they were ten years ago, when I discussed other formulas of this type, including one of my own, before the American Institute of Electrical Engineers. The following is a partial quotation from my discussion (*A. I. E. E. Transactions*, 1904, Vol. 23, page 734) . . . "the curve of train resistance, plotted as a function of the speed, is really a 'two-branch' curve; this fact is admitted and shown graphically by certain authors, including Wellington, Aspinall and Dennis; yet all 'our' formulas, as well as theirs, neglect entirely the first branch, showing the starting friction. That is why he could not help regarding them all, including

Mr. Smith's and his own, as mere make-shifts. He desired to point out that it would be necessary to do something more than merely to devise and introduce a new set of constants in a Maclaurin series of the form $Y = A + Bx + Cx^2 +$ etc., in order to accomplish something representing a material advance in our methods of dealing with train resistance in railroad engineering. We already have too many formulas of that kind. Moreover, it was not difficult to foresee that the physicist and the mathematician will contribute at least as much as, and perhaps much more than, the engineer, to the solution of the problem of finding a general formula for train resistance, if one be ever found. There is valuable work to be done by the engineer in obtaining data for theoretical analysis and in making tests for the purpose of proving or disproving the theory."

In 1907, in my discussion of the paper on the "Predetermination of Train Resistance," read before the Institute of Civil Engineers in London by Prof. C. A. Carus-Wilson, I again referred to this subject thus: "The Maclaurin power series $y = A + Bx + Cx^2$ had always been popular with designers of new train resistance formulas, and, to do it justice, it had done good service. It was undesirable, however, to dignify this equation with the term general equation until it could be completed by the introduction of a term which would provide for starting resistance. The complete general equation for train resistance would be one which gave, at zero velocity, not the value of zero, but a value equal to the starting (static) resistance. In order to do this there must be introduced a hyperbolic term, or a term in which the velocity appears with a negative exponent, thus $R = A + Bx + Cx^2 + Dx^{-n}$."

It is the general practice to assign a constant value to the first term of a formula of the Maclaurin-series type. This has the effect of limiting the scope and range of application of the formula. This first term, in reality, represents a sum of different effects. It varies with the weight per axle, the condition of the track, and, probably, with still other conditions. As I pointed out several years ago (*Harvard Engineering Journal*, 1905, Vol. III, page 269, and Vol. V, page 39) the power expended in causing a wheel to roll over any surface is expended in substantially the same manner as if the wheel were ascending a certain "equivalent gradient." It makes no difference whether the surfaces in rolling contact yield or not. When they yield there may be crushing and mangling effects; when they do not yield there may be shocks. These, as I pointed out, are mere details or incidents of the dissipation of the energy abstracted from the moving source to cause the rolling action. I adopted the term "track hysteresis," first suggested by Mr. A. Mallock, in England, and I used it, with slightly extended meaning, to designate generally all yielding effects due to continuous obstructions which were elastic in any degree and do not involve permanent deformation. (For a more complete analysis of the phenomena see the *Harvard Engineering Journal* articles or the discussion of Professor Carus-Wilson's paper already referred to.) Track hysteresis and all forms and phases of rolling resistance can be expressed in terms of the artificial gradient which they really produce. In this way it becomes possible to account for differences in the condition of the track, due to rails and ballast, to dirt, sand, snow, etc., because the artificial gradient causes a variation in the value of the first term. For this reason I have found it convenient to separate the first term into two parts $A = g' + a$, wherein g' is the resistance depending upon the equivalent grade due to the condition of track, including the presence of dust, dirt, snow, etc., and a is the resistance depending upon the weight per axle and other conditions. This segregation of the constant A into its two principal component parts has the effect of making a formula applicable to a much larger number of cases and conditions than it would be otherwise. The third term cannot be expressed as simply as it is in the formula under consideration in a formula intended to take into account variations in length of train. The formula therefore seems far from being entirely general in applicability. This consummation though "devoutly to be wished" is farther away and it doubtless involves many changes and additions in symbolical expression.

The tests were presumably made with great care and the records of the attendant circumstances and conditions are probably more complete than is usually the case in connection with such tests. It would be interesting and it might prove instructive to try to fit the data to train resistance formulas of other types, more comprehensive than the Maclaurin series type and including some of the features to which I have referred, such as starting resistance, journal friction, track hysteresis, etc.

C. O. MAILLOUX.

BOSTON, MASS., July 8, 1914.

To the Editors:

May I call your attention to some of the interesting features of the car resistance tests reported in your issue of June 20? From the standpoint of the traction engineer these tests are particularly valuable because they are conducted with a typical interurban car with a four-motor equipment, such as is very frequently installed, and at speeds which are thoroughly representative of interurban work. Very few resistance formulas have been based on runs with single cars. In fact, with the solitary exception of the Zossen trials of more than a decade ago, exact determinations of the resistance encountered by electric cars have been few and rather unsatisfactory. There are many train resistance formulas, old and new, yielding fairly satisfactory results, although the relative value of the several terms in the equation must necessarily be considerably altered when one considers a train rather than a single car, with its added possibility of lateral air and flange resistances and the general waste of energy that comes from persistent working of moving parts with respect to one another.

The general formula enunciated by the Illinois experimenters takes the ordinary parabolic form used by most previous investigators but differs in the relative value of the coefficients. Now a parabola is the most valuable carryall in graphics. With the coefficients properly chosen it can be made to hit to a very close approximation almost any set of observations which indicate a locus of single curvature, consequently the mere form of the equation has very little analytic importance and must be regarded as an empirical construction, valuable in proportion to the care with which it is made. The experimental work in the tests considered was apparently very carefully done and therefore the results within the limitations of the data must demand respect. The better to compare the results obtained with others, I write over against the Illinois equation that obtained from the Zossen tests.

$R = 4 + 0.222\,S + 0.00582\,S^2$ Illinois

$R = 4 + 0.02\,S + 0.0027\,S^2$ Zossen.

The car in these latter tests was very much heavier than the Illinois car but with about the same cross-section, and the drive was by four gearless motors. The range of speeds in the Zossen tests, however, ran from a little below 15 m.p.h. up to 130, as against the much lower range of the American test. Comparing these two resistance formulas the constant term is identical in each. The simple resistance term in S is about 10 per cent higher in the Illinois test than in the German one, a difference not big enough to be especially significant considering the nature of the data. When it comes, however, to the term in S^2, which is generally assumed to be chiefly concerned with air resistance, there is a very conspicuous difference in the coefficients, the Illinois result leading to a figure more than double that obtained in the Zossen tests, which were carried up to extreme speeds. The values of air resistance obtained from these latter were remarkably consistent and, moreover, are accurately checked by the air resistance values based upon Newton's formula and used by artillerists for dealing with the resistance of projectiles at velocities well below that of sound. There is, therefore, a large outstanding apparent discrepancy in the term involving S^2, too large to ascribe to experimental results. If one extrapolates to the Zossen speeds from the Illinois formula an absurd result is reached in view of the power consumption of the Zossen tests. And the discrepancy does not disappear, even when one applies the modified formula of the Illinois experimenters involving the cross-sectional area and weight of the car, but it changes sign and, curiously enough, drops to a considerably lower value than that indicated by the Zossen trials. These differences are instructive. They show first rather that the air resistance cannot properly enter as a mere coefficient to the term in S^2 but must be taken account of separately, as in the formula just referred to, and this even at speeds as low as 40 or 45 miles an hour when cars of only moderate weight are under consideration.

The difficulty in thus taking care of the air resistance lies in two matters which have never been really well investigated; first, the actual effect of the shape of the front of the car and, second, the effect of this shape on lateral drag at high speeds. In the Zossen tests the lateral resistances and those due to the bow collectors were quite perceptible and probably account for part of the differences observed. In fact, the Zossen air resistances, as determined up to the limit of speed used in the Illinois tests, would apparently be satisfied by a somewhat lower coefficient than that which would apply to the observations as a whole. One must therefore conclude that the results obtained in the Illinois tests and in the Zossen tests are really in a good deal better concordance than would appear at the first glance, and that with due corrections the apparently large discrepancy in the coefficient of S^2 is no more than might be expected from the widely different range of speeds. Setting this, therefore, aside, the very close agreement of the earlier terms in the equations indicates that the track and other normal resistances under modern conditions of construction can be very safely determined by either of the formulas and are considerably lower than the values given by earlier investigations. Finally, it is plain that the air resistance term, while approximately taken care of by a formula having a coefficient of S^2 in terms of the area and weight, still leaves material outstanding irregularities which need investigation.

LOUIS BELL.

The Sprague Double-Reduction Motor

SAN FRANCISCO, CAL., June 26, 1914.

To the Editors:

The writer recently made a visit to Sacramento and called at the car shops of the Pacific Gas & Electric Company, formerly the Sacramento Street Railway Company. On the floor of the machine shops was seen an old Sprague double-reduction motor, and while commenting on its appearance and doing some reminiscing about this old stanch and much-fun-poked-at motor an incident was told connected with its early history.

In about 1890 the carhouse foreman kept a blackboard on the wall of the building on which was a table giving dimensions of different parts of equipment, such as journal bearings, gears, axles, etc., and for the several equipments then in use. It seems there was a space left for miscellaneous figures. In this space was written and left for some time the following verse, said to be original with the foreman, the name of whom could not be learned:

"The little Sprague should fill this space,
But they're almost dead and out of the race;
Their days are numbered, their work is done,
Though the meaner you treat them the better they run."

We all know what abuse the old Sprague was put to in many shops and how it was relegated to some shelf or pit, there to furnish power for machinery. It was often buried deep in dust and dirt but was ever faithful to its duty.

The above verse shows where Frank's baby stood in the estimation of the "man behind the gun," and to one "who was there" it recalls many haps and mishaps of the early days of electric traction.

W. FRANK CARR.

ASSOCIATION NEWS

COMMITTEE ON FARES AND TRANSFERS

A meeting of the committee on fares and transfers of the American Electric Railway Transportation & Traffic Association was held July 8 in Chicago at the office of J. V. Sullivan, Chicago Surface Lines, and chairman of the committee. G. K. Jeffries, general superintendent Terre Haute, Indianapolis & Eastern Traction Company, was also in attendance. The report of the committee was completed for publication. It will be divided into recommendations for city lines and for interurban lines. For city lines the report will take up a number of practical subjects connected with the use of fare boxes, such as the maintenance of these boxes and the effect of these boxes on the gross receipts; it will also take up the present status of transfer issuing and collecting devices, will discuss the use of metal tickets versus paper tickets and the methods of accounting for free passengers. It will also make recommendations on the proper practice in the case of bodily transfers. Mr. Jeffries, as chairman of the sub-committee in charge of interurban practice, will discuss the collection, registration and accounting of interurban fares. The committee has been quite successful in securing a large number of data sheets to form the basis of its report.

COMMITTEE ON ENGINEERING ACCOUNTING

M. W. Glover, president of the American Electric Railway Accountants' Association, has appointed Charles H. Lahr, auditor of the Northern Ohio Traction & Light Company, Akron, Ohio, a member of the joint committee on engineering accounting, in place of F. B. Lasher, resigned.

Electrification of Berlin Railway

The preliminary work for the electrification of the Berlin Stadt & Ringbahn is reported to be making excellent progress. Inauguration of construction is planned for the early part of the year 1915, but it is expected that the electrical service will not be started before 1917 as this depends upon the reconstruction of the Friedrichstrasse station, one of the principal terminals in Berlin. The report of the State Railways Administration to the 1915 session of the Prussian Diet will not only call for additional funds but will also give a detailed report on the electrification plans. The first section to be electrified will be from Charlottenburg to Rummelsburg. Energy will be transmitted from a government station at Bitterfeld.

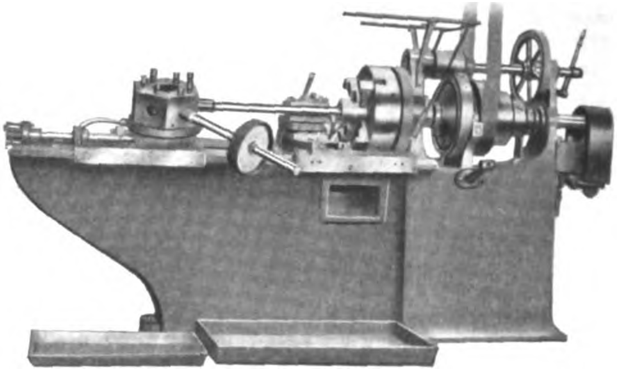
Boring Bearing Practice of the Bay State Street Railway

BY E. J. HAINES, ACTING ASSISTANT SUPERINTENDENT EQUIPMENT

Properly finished bearings play an important part in reducing motor maintenance costs, and upon the shop devolves the task of furnishing at the lowest cost a bearing from which the maximum efficiency will be obtained. At the Chelsea (Mass.) shops of the Bay State Street Railway bearings were formerly turned out in the ordinary lathe, but in the past year a large saving has been effected by securing for this work the second-hand 21-in. Gisholt turret lathe shown in the half-tone illustration. The bearing is held in place by means of a four-jaw universal chuck to insure quick and accurate work.

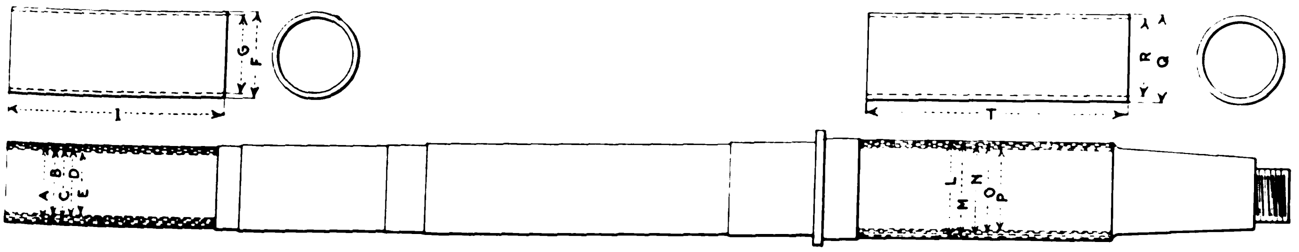
The present practice is to use a babbitted armature bearing with a semi-steel shell. These are furnished in two sizes for each type of motor. When the armature shaft becomes worn 1/16 in. it is turned so that the shaft diameter is ⅛ in. smaller than the original size, and the smaller bore bearing is used. When the shaft which has been turned becomes worn 1/16 in. it is turned again and a sleeve is then put on to make it the original size, so that the large bore bearings are used again. With this procedure few bearings are turned at the carhouses, and as a large number of bearings of each type are babbitted in one lot, it gives the opportunity to put these through the boring process. The job is also done in large lots, thereby reducing the tool adjustment to a minimum and securing the best results in the least time.

The tools for the boring process are secured on the boring bar, and separate boring bars are provided for each type of bearing to avoid frequent adjustments of the tool. After the tool is once accurately set with a depth gage, it need not be changed except by grinding.



TURRET LATHE WITH FOUR-JAW UNIVERSAL CHUCK FOR BORING BEARINGS

The first operation after the bearing has been placed in the chuck consists of a roughing cut varying from 1/16 in. to 3/16 in. The turret is then turned and the second boring bar is used for the finishing operation, less than 1/64 in. being taken off, thus giving a very smooth finish to the bearing surface. The turret is then withdrawn and the third operation is commenced. This consists in facing the babbitt on the collar, and rounding off the bearing surface at collar end of bearing. This is done with the tool on rest using cross feed.



COMMUTATOR END

A. Full size of standard armature shaft.
B. When shaft is worn down to this size, turn down to C.
C. Second standard size for armature shaft.
D. When shaft is worn down to this size, turn down to E and sleeve.
E. When shaft has been turned to this size, it must be sleeved to full size(A.)
F. Tubing outside diameter.
G. Tubing inside diameter.

DATA FOR TURNING AND SLEEVING ARMATURE SHAFTS, BAY STATE STREET RAILWAY

As a check on the wearing of the tool all bearings are gaged after being bored. The diameter of the bore is checked by means of a snap gage, and the thickness of the collar is checked with a collar gage. The boring of all armature sleeves is also done on this lathe.

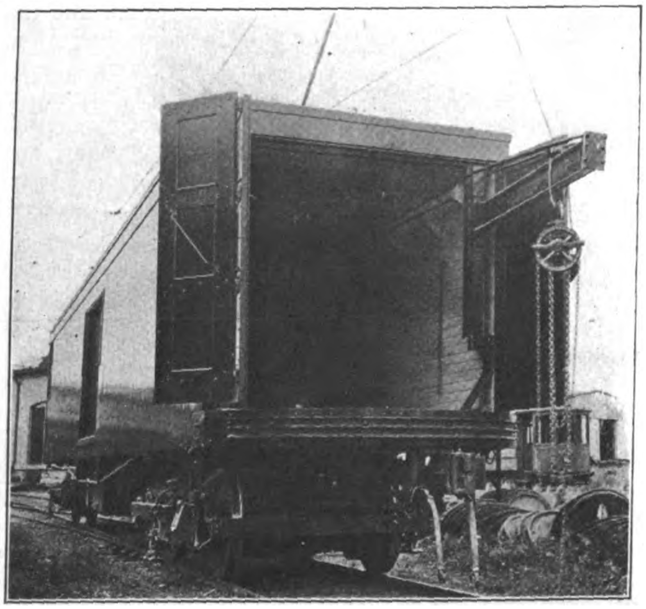
The average time consumed in boring and facing a commutator end bearing is five minutes. This is the average of a large number of bearings bored and includes changing bars, adjustments, etc. The actual time to place in the chuck, bore and face a GE-80 armature bearing, commutator end is four minutes. A pinion end bearing takes about a minute more on the average, in order to be sure that the two halves are properly aligned.

A metal shield, not shown in the illustration, is mounted on the lathe to prevent the babbitt borings from scattering over the floor, a pan being provided underneath the lathe to catch all that is deflected from the shield. This eliminates all possibility of steel chips getting in with the babbitt, which might happen if the babbitt borings were allowed to drop to the floor and if they were then swept up.

Michigan United Traction Company's Supply and Wrecking Tool Car

BY R. C. TAYLOR, SUPERINTENDENT OF EQUIPMENT

The Michigan United Traction Company has just put into service a combination car which is to be used for general utility purposes. It is located at the general storeroom and shops at Albion, Mich., and is regularly used to distribute supplies to the various shops of this company at Jackson, Lansing, Kalamazoo and Battle Creek. This car also has a complete equipment of material usually employed in attending to troubles that may develop in interurban car service, and is always ready to answer any call. Since all the city shops have wrecking cars, this one was designed primarily for attending to interurban troubles. The electrical equipment includes a quadruple set of Westinghouse 333 B-2 motors with type HL control, arranged to run on full speed of 600 volts or 1200 volts, either on trolley or third-rail. The motors are geared for high speed, having the same gear ratio as those on the limited passenger cars, and therefore can readily keep out of the way of the fastest cars on the line, and also reach the location of any trouble in the shortest possible time. As this car is equipped with multiple-unit control, it may also be coupled to any of the cars with similar equipment to bring them to the nearest station with the shortest possible delay to traffic.



MICHIGAN TRACTION WRECK CAR, REAR VIEW, SHOWING JIB CRANE

Closed compartments to house the wrecking tools occupy the front half of the car. These may be locked when the car is used as a supply car or while in switching service around the shops. Each of the two side doors at the center of the car is equipped with a 1-ton jib crane. The rear end of the car is fitted with a three-leaf door which may be opened the full width of the car, thus facilitating the loading of trucks, wheels and axles or other bulky material. At one side of this door is a 2-ton jib crane with a boom of the same length as width of the car. This crane is arranged to fold inside the closed end door. In addition to the three jib cranes this car has a small traveling crane which runs the full length of the car body, and with its aid bulky material may be deposited in any part of the interior. The car was designed and built by the Niles Car Company, Niles, Ohio. The jib cranes are home-made, with Yale & Towne differential hoists.

Hints On and Costs Of Motor Maintenance—I

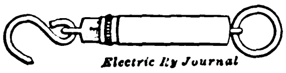
BY R. H. PARSONS, ELECTRICAL FOREMAN

Whether motors are cared for at the shop or carhouse, they must after a certain period be stripped, cleaned, tested, fitted with new bearings and reassembled. What this period should be must be determined by the type of motor, the service conditions and the care received in the carhouse.

The earlier motors require far more care and attention than the later designs, particularly on account of lubrication. At their best, these motors can be kept from giving trouble only by care and vigilance and at a cost which makes it of doubtful economy to run them when the maintenance cost of modern motors is so low, except possibly where the service is unusually light. Such antiquated motors must be inspected and checked for clearance each night, or every two nights at the outside, and must be oiled just as often. Yet regardless of careful checking for clearance and oiling, their bearings will sometimes run hot, or a worn bearing which has escaped the eye of the inspector will bring the armature down on the pole pieces, thus tearing out the armature coils, chewing up the laminations of the armature core and destroying the field coils.

The later motors are superior in other respects besides lubrication, notably in bearings, commutation and in better insulated brush-holders. Again, the last are designed to be placed only in the position located by the designer while the studs, etc., are so arranged that the brush-holder cannot be adjusted except as to distance from the commutator. The liability of flashovers from the commutator to the shell has also been reduced by increasing the air gaps between the shell and commutator from 1¼ in. and 1¾ in. to 2½ in or more.

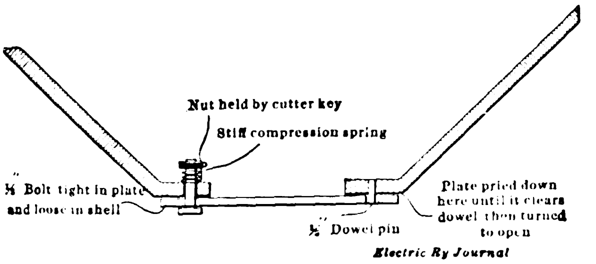
Not only must the oil and clearances of the old motors be watched closely, but the brush-holders should also be inspected more rigidly than those of the later type. A spring with too little tension leads to arcing between the brush and the commutator, thereby destroying the brush and brush-holder and leading to flat spots and flashovers which end in costly overhauling of the armature and the turning down of the commutator. A loose or improperly set brush-holder leads to the same results. In the newer brush-holders this trouble is practically eliminated.



BALANCE FOR BRUSH TENSION, ONE-FOURTH SIZE

The tension of the brush-holder springs of the older type motors must be set at 6 lb. to 6½ lb., whereas those of the later type motors, with interpole fields and other aids to good commutation, can be set as low as 4 lb. to 4½ lb., which decrease greatly reduces the wear of both the commutator and brush. It will be found to the advantage of the company to provide a small balance scale, similar to the one shown, for the men who overhaul brush-holders to check the tension of the springs, or to create enough interest in the subject to lead the men to buy it themselves. The scale is neat and accurate, not too bulky to be placed in the pocket, and a matter of pride to the users.

As dust and water are liable to get into the shell the inspection covers should be kept on at all times except during inspection. It is not necessary to dwell upon the bad effects of water, but too little attention is paid to dust. Even if dust does no immediate harm, it gathers on the commutator, brush-holders, inside of the shell and inside of the armature ventilating ducts. Dust on the commutator cuts the commutator and the brushes. On and around the brush-holders, its mineral particles make paths for current leakage, and consequently grounds are formed. The gathering of dust in the armature ducts chokes them up and destroys their ventilating qualities. The accumulation of dust in the motor, in my opinion, is one of the points against the use of ventilated motor, as the air which is drawn in adds more dust than it forces out. The dust mixes with the oil, which sometimes gets into the bottom of the shell, or with the aid of a little water it makes in the shell around the fields a damp mass which the heating of the motor will not dry out. Continued dampness around the fields makes them musty and destroys the insulation. On the other hand, a motor with sealed inspection covers excludes the dirt and water and keeps in better condition, providing, of course, that the capacity of the motor is great enough to fulfil its service without overheating.



Nut held by cutter key
Stiff compression spring
⅝" Bolt tight in plate and loose in shell
Plate pried down here until it clears dowel then turned to open
½" Dowel pin
Electric Ry Journal

CROSS-SECTION AT BOTTOM OF MOTOR SHELL, SHOWING HANDHOLE PLATE

The accompanying sketch illustrates a hand-hole cover designed and used on the GE-57 motor but which could be adapted to any. It consists of a plate fitting the surface of the shell and held on one side by a bolt extending inside of the shell with a spring held by a nut keyed to the bolt. The other side is simply kept from turning by a dowel pin, fitting tight in the shell and loose in the cover. The spring tension holds the plate in place, except when it is desired to open it, then by using a small bar to force the cover down until it clears the dowel pin the cover can be turned clear of the inspection hole. To replace, simply turn the cover until the dowel enters the hole in the plate, when it will snap itself securely into place.

Often too much oil is used in the bearings, particularly on the commutator end; or if the bearing is loose on the shaft, and the oil-draining ducts are stopped up by dirt, the oil from the bearing runs into the motor where it gets onto the string band and to the end of the commutator. This, added to the accumulation of dust, makes further trouble, chiefly in short-circuiting the commutator bars, which in turn short-circuit the coils, burning them out or making a path for the current to jump from the commutator to the shell. This defect could be minimized by using more care in oiling, but even if oil does get onto the commutator it will do no harm if wiped off soon enough. One good practice is frequently to wipe clean the commutator string band and the ends of the commutator bars and to paint them with a first-class oilproof insulating varnish. This action will save many armatures which would otherwise flashover or short-circuit, and it will also prevent grounded commutators.

MAINTENANCE COSTS OF NEW AND OLD MOTORS

As a comparison of the difference in maintenance cost for new and old type motors as used by a large railway system in Greater New York, the following figures on the total cost of labor and material expended in motor maintenance for the year 1913 are significant: Class A, one modern type, $29.04 per motor; Class B, a second modern type, $21.56 per motor, and Class C, older miscellaneous types, $35.27 per motor. The motors in Classes A and B ran for many hours practically every day in the year. Those in Class A were in a little harder service than those in Class B, but the older Class C motors ran in lighter service. In fact, at least one-half of the old motors were out of service during either the summer or winter, according to the type of car. Others were on snow sweepers and work cars, doing service only a small part of the time. Hence it is safe to say that the old motors were in use only one-third as much as the new ones. As the cost per motor is figured on the total number owned, the cost, if all had been in continuous service, would have been three times as great, or $105.81 per motor. This cost represents all the labor and material used in the carhouses and shops.

Another example of the cost of maintenance of the old types against the new types of motors is shown in the percentage of armatures rewound to the number in service during the year 1913: Class A, 7.0 per cent; Class B, 2.6 per cent, and Class D, 18.0 per cent.

The modern motors are in a harder service, and run 30 per cent more mileage a day than the older type. As they have been in use five or six years, their good record cannot be attributed to absolute newness. On the other hand, the older armatures were practically renewed the same number of years ago, and are kept up to the highest standard consistent with their design.

Use of Metallic Tapes on Third-Rail Lines

Surveyors on railroads operated by third-rail should use metallic tapes with discretion or avoid their use entirely. While danger of contact with the third-rail is imminent, the more frequent accidents seem to arise from leaving such tapes between the rails while trains pass over.

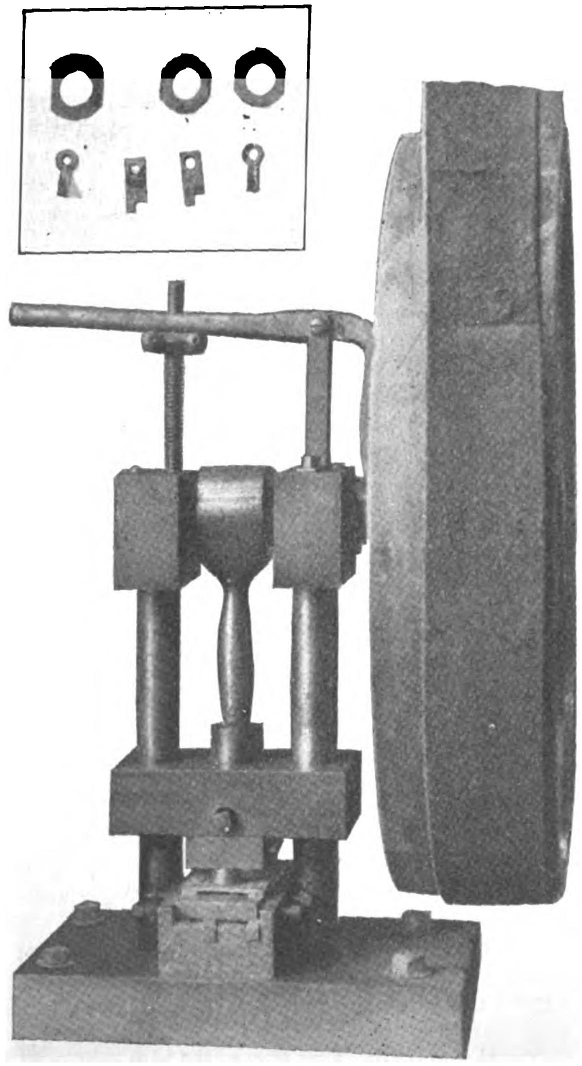
These tapes are often picked up by the armatures of the motors, particularly where gearless motors are used, with resulting damage to property. Small metal tools should never be left lying between the tracks for the same reason.

A Home-Made Punch and a Home-Made Shear

BY F. J. FOOTE, MASTER MECHANIC THE OHIO ELECTRIC RAILWAY

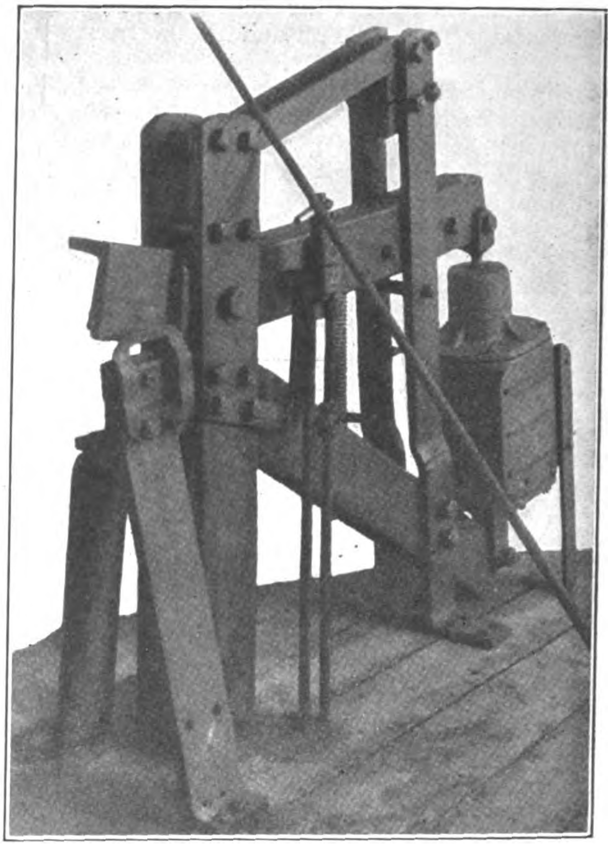
The first of the accompanying views shows our small home-made punch for punching trolley washers, rheostat washers, small copper terminals, etc. It is designed just to punch soft sheet metal of a thickness up to 1/16 in.

This is the only punch press in the shop, and we find it very handy for light work. It is shown arranged for hand trip operation. Samples of work done on this punch are shown in the upper left-hand corner of the above illustration.



HOME-MADE PUNCH OF THE OHIO ELECTRIC RAILWAY FOR PUNCHING TROLLEY WASHERS, SMALL COPPER TERMINALS, ETC.—NOTE SAMPLES OF WORK

The second view shows a shear for use in our blacksmith shop. It is hardly necessary to state that this machine is home-made, for the scrap pile was robbed of a number of parts for building it. The size of the device can be judged from the air cylinder, which is a standard 12 in. x 12 in. It is operated by an old straight-air motorman's valve. With this shear we can cut off iron up to 5/8 in. square.



A SCRAP-MADE SHEAR OF THE OHIO ELECTRIC RAILWAY

New Composition Glass of Great Strength

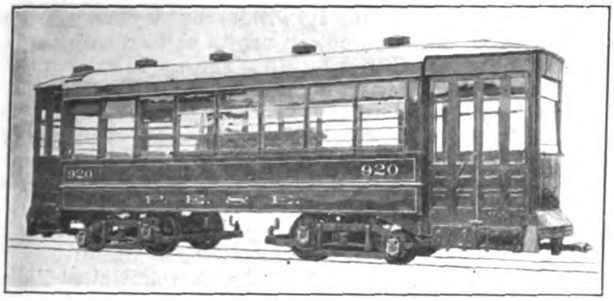
A new composition for glass known as "triplex," which embodies features of unusual strength and safety when breaking, has been recently developed in France. This product consists of two sheets of ordinary glass separated by a thin sheet of transparent celluloid—all caused to adhere closely by chemical agents and heavy pressure. In circumstances where ordinary glass would break and fall in all directions "triplex" glass simply shows a network of radiating cracks. In accidents such as trolley collisions where the shattered glass would probably wound many passengers, this new glass would simply crack and do no harm beyond covering the passengers with a fine powder. This was practically demonstrated in a recent accidental collision of an automobile with a car of the Chemin de Fer Nogentais, Paris, France, in which the "triplex" glass of the car was cracked but not broken. If three panes of glass and two of celluloid are used, plates called "bitriplex" are the result. These are so solid that they cannot be broken even with violent blows of a hammer. They may be cracked and the outer sheets may even be pulverized, but it is impossible to get through the combination.

The Glasgow Corporation Tramways have started a "safety first" campaign by placing on the fronts and rears of 150 cars boards on each of which is pasted a bill bearing the words "Safety First." The wording of these bills will be changed at intervals.

One-Man Near-Side Cars for Oregon

Four one-man, near-side, semi-convertible prepayment arch-roof cars, as shown in the accompanying illustration, were recently built by the American Car Company, St. Louis, Mo., for the Portland, Eugene & Eastern Railroad, Portland, Ore. These cars, mounted on No. 39-E maximum-traction trucks, have metal underframes and wooden body with an interior trim of bronze. The general dimensions of the car are as follows: length of body, 21 ft.; length over vestibule, 30 ft. 7½ in.; bolster centers, length, 13 ft.; width over sills, 7 ft. 9½ in.; width over posts at belt, 8 ft.; height, sills to trolley base, 8 ft. 6⅝ in.; height from top of rail to sills, 2 ft. 5¼ in.

The front platform of each car has a pair of hinged folding doors and folding steps for the regular entrance and exit. An additional emergency exit with folding door and folding step is located in the rear of the car. The seating arrangements, which allow for a total seating capacity of thirty-six persons, include a broad curved seat extending across the rear of the car, six rattan-covered cross-seats on each side of the aisle and longitudinal corner seats. Axles, truck bolsters, brake-shoes, car trimmings, center bars, hand brakes, journal boxes, sash fixtures, side bearings and springs are of Brill design. Two GE-216 motors per car are provided. Other specialties include Westinghouse air brakes, American Car Company body bolsters and bumpers, Hedley anti-climbers, Tomlinson automatic radial couplers, Curtain Supply Company's curtains and curtain fixtures; Hunter destination signs, gongs, Consolidated push button signals, American Mason safety treads, Knutson trolley catchers and 10-in. Globe ventilators.



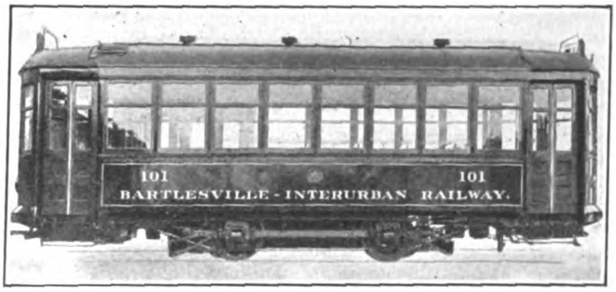
SIDE VIEW OF ONE-MAN NEAR-SIDE CAR WITH EMERGENCY EXIT AT REAR

A Lubricant with Graphite in Permanent Suspension

A semi-fluid concentrate containing graphite, known as "Lesoyl," specially prepared to insure the suspension of graphite when mixed with lubricating oil or grease, has been brought out recently by the Lumen Bearing Company, Buffalo, N. Y. It is asserted that this fluid permits the graphite to be carried to all parts of the bearing surface. The oil film is preserved unbroken, the graphite flakes taking part of the journal load. This mixture is intended for lubrication on a wide variety of bearing surfaces. In preparing the mixture the manufacturers first mix the graphite with a material that has a strong capillary affinity for the graphite. The latter substance is ground to the desired degree of fineness, and by this means larger particles of graphite that have heretofore been found practicable are carried in permanent suspension. It is stated that tests show that the introduction of the new preparation into the cheaper grades of mineral oil gives a lower coefficient of friction and produces a thicker oil film between the bearing surfaces, while better grades of oil are enabled by this addition to withstand much higher bearing pressures.

A Single-Truck, Fully-Inclosed Car

A single-truck car possessing many features unusual for equipment of such small size has recently been built by the St. Louis Car Company for the Bartlesville-Interurban Railway. It is only 30 ft. 8 in. long over the bumpers, but it is built without bulkheads and is equipped with folding doors and steps to make a fully-inclosed design such as is now growing in favor for use in large cities. The car is built with a steel underframe, and a 30-in. x ⅛-in. plate is installed for a side girder between the belt and the side sills. The roof is of plain arch type with Globe ventilators, and no headlining is installed on its underside, the carlins being exposed. The side posts and carlins and roof are of wood, but the interior finish beneath the windows is of No. 16 sheet steel. The car seats thirty-two passengers and it is 21 ft. long over corner posts, the width over side posts being 8 ft. 3 in. The rear doors are opened by means of a lever arrangement operated by the motorman. Among the other items of equipment are Pantasote curtains on spring rollers with Forsyth fixtures, Kirby Neal headlights and Consolidated heaters. The car will be equipped with the car builder's vertical geared wheel brake and radiating draw bars at each end.



SEMI-STEEL, SINGLE-TRUCK CAR FOR BARTLESVILLE-INTERURBAN RAILWAY

Flood in Simplon Tunnel

The famous Simplon tunnel, constructed between 1898 and 1905 and electrified with the three-phase system, was flooded on July 7 by a subterranean stream which burst through the retaining wall. The interruption to traffic was temporary. A train was derailed in the middle of the tunnel but no one was injured. During the interruption it was necessary for travelers to use the Simplon Pass or the St. Gothard Pass. The Simplon tunnel electrification is of interest not only on account of the fame of the tunnel itself, which is 12.3 miles long and bored at a great depth, but because the three-phase system used is radically different from the single-phase system of other Swiss railways. The tunnel installation is valuable for comparison with the standard single-phase system, and the occurrence of this flood will result in some interesting data. As the flood is reported to be only 2 ft. deep, however, it is unlikely that the electrical equipment was damaged.

The United Railroads of San Francisco have established their shop inspection system on the car-hour basis instead of on the car-mile basis. One advantage of this plan is that all of the data required for determining the car hours are at the carhouses, whereas the operating department supplies the mileage figures.

News of Electric Railways

Committee Meetings in Toledo

Two committee meetings were held at Toledo, Ohio, during the week, but the proceedings did not get beyond the point of discussion. Seemingly both sides are waiting until all the franchise suggestions in course of preparation have been submitted. If the City Council does not act the Toledo Citizens' Franchise Association will in all probability take steps to place its proposition before the voters. Should the Municipal Ownership League succeed in getting its draft submitted to a vote first, the Citizens' Franchise Association will urge its proposition with the hope of defeating the other proposal.

A meeting of the franchise committee of the City Council was held on the evening of July 2. The propositions so far submitted were discussed in an informal way. Representatives of the Toledo Citizens' Franchise Association were present, but otherwise the session was executive.

Attorney Frank L. Mulholland urged the committee to take action on the proposition presented by the Citizens' Franchise Association, in order that it may be used to offset the so-called Thurstin-Campbell municipal ownership plan. Judge John H. Doyle, of the association's franchise committee, said the property of the railway could not be acquired for many years under the plan proposed by the Municipal Ownership League. Mr. Doyle said the association had considered the sliding scale plan, as operated in Cleveland, but had understood from Mr. Doherty that the company would under no circumstances accept a franchise based upon such a scale. Both he and Mr. Mulholland stated that this plan would keep the matter in politics continually.

Judge Doyle discussed at length the provision in the business men's proposition which requires the written consent of the owners of 90 per cent of the company's bonds to the proposition, so that there will be no trouble should both the city and the company accept the plan. He also discussed the extent of the city's control over both the rates and operation of the road under this plan and said it is broader than that provided in either the Doherty or the committee drafts. Judge Doyle said that the Council had no right to pass the Schreiber 3-cent fare ordinance, fixing a certain rate of fare without the consent of the company.

It is understood that Councilman F. M. Dotson has been instructed to prepare a franchise based upon the Cleveland plan as an alternative in case the others fail of adoption. It would have the sliding scale of the Cleveland plan and the rate of income on the investment depending upon the decrease or increase of the fare rate, as in the London plan.

This plan, as well as the others, was discussed at a meeting of the Council committee on the evening of July 6. The only detail of this meeting made public was a brief statement by Mayor Keller that the committee is not impressed with the proposal made by the Toledo Citizens' Franchise Association and that the members still stand for a flat 3-cent fare.

The campaign for the initiation of the municipal ownership ordinance was opened on the evening of July 6 at Riverside Park with a speech by Irvin E. Austin, chief clerk in City Solicitor Thurstin's office. Mr. Austin attacked one of Henry E. Doherty's advertisements relating to the municipal ownership franchise. Mr. Doherty claims that the provision for municipal ownership did not go into effect until June 8, ninety days after it was placed on file with the Secretary of State, and that the preliminary proceedings relating to the extension of the ordinances of the company were begun before that time. Mr. Austin discussed the capitalization of the company. He said that it could not operate at a 3-cent fare and meet the interest and the dividend charges on the present amount of stock and bonds. Municipal ownership of the railway, lighting and heating properties would reduce taxes. The $8,000,000 bonds would be a lien on the plants themselves and have nothing to do with the taxes. John J. Quinlivan, business agent of the Central Labor Union, attacked the Toledo Citizens' Franchise Association because it held secret sessions while its franchise was in course of preparation. He also claimed that Mr. Doherty opposed the union leaders' efforts to organize the street railway employees.

Police Chief Murphy has ordered patrolmen to arrest members of the car crews whenever disturbances occur on the cars.

Frank L. Mulholland, in charge of the Toledo Citizens' Franchise Association, said on July 7 that the organization had not yet definitely decided upon the next step to be taken, but that nothing will be done until after the Council meeting on July 13. The franchise committee will meet again on July 10 and will probably prepare a report to the Council. The future action of the association will depend upon the nature of this report and the possibility of the Council taking steps to hasten the settlement.

Detroit Appraisal Details by November

By the terms of a contract entered into on July 6, between the Detroit Street Railway Commission and Prof. E. W. Bemis, Chicago, the commission is to be furnished a complete inventory and appraisal of all the property of the Detroit United Railway within the city not later than Oct. 10. The data and details are to be filed with the commission not later than Nov. 15. The appraisal is to start immediately and the cost is to be not more than $46,000. Of this amount Prof. Bemis is to receive $5,000, of which $2,000 was paid immediately as a retainer, and a commission of 10 per cent of the actual cost of the appraisal. Edward P. Burch and Charles L. Pillsbury, engineers, are to receive respectively $50 and $60 a day and actual expenses. Mr. Burch is to have direct charge of the work. A staff of twenty or more will be engaged for the appraisal.

J. C. Hutchins, president of the Detroit United Railway, has advised the commission that the company will cordially co-operate in every way possible to enable the commission to arrive at a correct judgment of the equities involved and of the value of the company's property, reserving the right, however, to assume a different attitude should those put forward by the commission show any disposition to deal unfairly with the company. In his letter Mr. Hutchins observes: "I do not make this reservation with the thought that anyone you (the commission) may name to gather data for you will deal unjustly with us, but in view of the fact that we have at times been unfairly dealt with by persons in public life with axes of their own to grind."

William Barclay Parsons, New York, who spent several days in Detroit recently studying the traffic problem, has notified the Street Railway Commission that he will be in Detroit on July 13, to report on the advisability of the city going ahead with plans for a subway. His letter advises the commission that he is ready to suggest means for solving congestion either by the construction of a subway or the re-routing of cars on the congested district.

Report of Industrial Commission of Wisconsin

According to the report of the Industrial Commission of Wisconsin concerning the operation of workmen's compensation in the State for the year ending July 30, 1913, a total of 2028 employers and 149,164 employees were under the act, as compared with 435 employers and 63,728 employees at the end of the preceding year. During the year ended June 30, 1913, 44.6 per cent of the accidents reported were under compensation; during the six months from Jan. 1 to June 30, 1913, the proportion was 52.8 per cent, and during June it rose to 61.1 per cent.

The Wisconsin law gives a free field to all forms of insurance. The old insurance companies at first opposed the act both by a campaign of misrepresentation and by prohibitive rates. They first doubled their former rates for liability insurance and then doubled the liability rates for compensation coverage. A mutual insurance company, which offered compensation for less than the old line companies charged for liability insurance was formed at Wausau and for the first eighteen months most employers under compensation either carried their own risk or were insured in the Wausau mutual. On Feb. 1, 1913, the old line companies reduced their compensation rates 25 per cent and increased their liability rates 50 per cent, so that on a "standard ($5,000-$10,000) limit" policy the rate is now the same for compensation as for liability insurance.

The report states that the remarkable and gratifying result of the administration of the law thus far is the ease with which employers have been able to fix compensation for injury and the very few cases which the commission has been called upon to adjust. A total of 5030 accidents was reported under the compensation law from Sept. 1, 1911, to July 1, 1913. Hearings were held and awards made in but eighty-one cases and only nine applications were made for court review. During the year ended June 30, 1913, a total of 3968 accidents under compensation was handled at a total expense of $8,326, giving an average of 2.10 cents per accident as compared with 3.19 for the preceding year.

The report states that the commission has not as yet sufficient data to determine the cost of compensation. Reports are, however, received from all employers carrying their own risks and from all liability insurance companies, and within a few years it will be possible to state the approximate costs of compensation for each industry. Data already in hand indicate that where the employer carries his own risk or is insured in a mutual company the cost is seldom greater than that under the old common law liability.

The Cleveland Wage Question

The members of the executive committee of the local branch of the Amalgamated Association of Street & Electric Railway Employees at Cleveland, Ohio, voted on July 1 not to accept the proposition made by J. J. Stanley, president of the Cleveland Railway. The stumbling block is the minimum workday of five hours which Mr. Stanley specified. The question will probably be submitted to a vote of the men before anything further is done.

George R. Davies, president of the local branch of the union, said that the plan offered by Mr. Stanley would cause a large number of men to be reduced from eight or nine hours a day to five hours. He also claimed that the extra men would be subject to the call of the dispatcher eighteen hours a day.

Mr. Stanley insists that he will not agree to any plan that will add more than $150,000 a year to the operating expenses. Furthermore, he says that he will not grant the newer men in the employ of the company an increase without making the same increase in the wages of the older men. The contract between the men and the company provides for arbitration on all disagreements.

On July 6 Mr. Davies stated that a second proposition on the question of wages and conditions will be made to Mr. Stanley. On the other hand, Mr. Stanley asserts that he will entertain no proposition that does not comply with the terms of his offer, as originally made. This is fair to all, he said, and is as far as the company can go. Mr. Davies intimates that the new proposition will deal with the distribution of the $150,000 additional the company is willing to pay the men. He says that under Mr. Stanley's plan about $90,000 will be taken away from a certain number of the men through loss of time and only about $30,000 returned by the increase in wages. He adds that the second proposition will be made, whether Mr. Stanley considers it or not.

New Rapid Transit Route in New York

The Public Service Commission for the First District of New York has laid out an entirely new rapid transit route in Brooklyn and adopted a plan for a radical modification of another. The new route is for the so-called crosstown subway line. It will run southerly from the Queensboro Bridge Plaza, where it will connect with the new rapid transit lines in Queens and the Steinway tunnel, to and under the Williamsburg Bridge Plaza to a connection with the Brighton Beach Railroad of the Brooklyn Rapid Transit System. The contracts as approved last year contain no provision for this line. It is now proposed to make it an extension of the dual system, and the difficulty as to Franklin Avenue has been met by providing for a subway through that thoroughfare and for an elevated railroad for other parts of the route. This route has been sent to the Board of Estimate and Apportionment and the Mayor for approval.

The route of the Fourteenth Street Eastern District line is the one which will be modified. This route, which is a part of the dual system, begins in Sixth Avenue, Manhattan, and runs under Fourteenth Street to the East River, under the East River to North Seventh Street, Brooklyn, and through North Seventh Street to Metropolitan Avenue and through Metropolitan to Bushwick Avenue, and thence through Johnson Avenue to Wyckoff Avenue, and from Wyckoff Avenue to a junction with the Broadway elevated line in East New York. The plan called for an elevated railroad through Wyckoff Avenue, and this the property owners opposed. The commission, on this account, sought to make an arrangement with the Long Island Railroad by which the Eastern District line could be continued from Johnson Avenue over the right-of-way of the Evergreen branch of the Long Island Railroad instead of Wyckoff Avenue. This branch, which is very little used by the railroad company, runs parallel to Wyckoff Avenue. After protracted negotiations the consent of the railroad company was obtained, and the commission has accordingly changed the route from Wyckoff Avenue to the Evergreen branch right-of-way. This route is known as No. 59, and has been sent to the Board of Estimate and Apportionment and the Mayor for their approval.

Some time ago Walter Wellman presented to the commission a plan to enlarge the station platforms in the subway so as to accommodate trains of twenty cars or more. The chief engineer of the commission held that the plan was impracticable. Mr. Wellman then proposed that the commission submit the matter to a board of engineers for an expert opinion. Alfred Craven, chief engineer of the commission, while still opposing the plan, consented to such an investigation. At the last meeting of the commission, Commissioner Robert C. Wood brought up the matter, and on his motion the commission decided to ask the Board of Estimate and Apportionment for an appropriation of $8,000 to retain expert engineers to make a report on the proposition.

Springfield (Mo.) Rate Case Decided

The Public Service Commission of Missouri made public its unanimous decision on June 24 in the Springfield Gas & Electric Company rate case. According to the abstract of the decision sent out by the commission, it is found that a net return of 7 per cent is adequate for the company, and a reduction in rates amounting to more than 30 per cent is ordered. According to the calculation of the commission, this will have the effect of reducing the revenues approximately 37 per cent. The company, it is announced, will file an application for a rehearing of the case. The brief that was presented to the commission by the company was abstracted in the ELECTRIC RAILWAY JOURNAL of May 2.

The Springfield Traction Company and the Springfield Gas & Electric Company were the defendants in the case. All the stock of these companies is owned by the Springfield Railway & Light Company, a holding company of Maine, and all of the latter company's stock is owned in turn by the Federal Light & Traction Company, a holding company of New York.

Evidence was introduced at the hearing to the effect that an up-to-date distributing system could be built at Springfield for $151,266. It was noted also that the assessed value of the entire property of the Gas & Electric Company for 1911 was $150,000. It was found, the decision says, that $500,000 stock and $277,000 bonds were issued on property for which the secretary of the company testified $300 000 was paid. The assets as shown by the books are $865.713 for the electric department. The commission observes that no deductions for superseded property had ever been made, and that. except for an item of $5,666, no depreciation had been deducted during twenty-nine years, and further that $60,000 is included as franchise values of the gas and electric property. The commission arrives at the conclusion that $270,000 is the corrected original cost of the electric department of the company, holding the amount for which the plant was transferred upon the books of the company, $414,526, to be entirely too large. The fair present value for determining reasonable rates of the property of the electrical department as of Sept. 30, 1913, is set at $300.000.

The companies asserted that the business had a distinct "going value" of between $60,000 and $137,900, based upon the earnings of the present plant. The commission holds that a distinction is to be made between a valuation of the properties of public utilities for the purpose of sale or condemnation and a valuation for rate-making purposes. The commission says that no proof was offered tending to show that the company suffered early losses, but that the record disclosed much evidence indicating that the early losses, if any, have long since been recouped through excessive rates, and that the alleged earnings have been from the electric department and the losses, if any, from the gas and street railway departments. No separate and distinct item for going value is allowed in this case but the commission takes "into account the fact that the plant was in successful operation" in fixing the fair value for rate-making purposes.

The commission in arriving at the rate of return to be allowed states that 6 per cent is the legal rate of interest in the State and by contract the rate may not exceed 8 per cent, and holds that 7 per cent is a just net return on property invested in public utilities. The rate of return must be determined from the facts of each case. For depreciation the commission makes an allowance of 5 per cent of the present fair value of the property.

In considering the salaries and commisions paid to the Federal company the opinion states: "We think, because of this situation [control by the Federal company through the railway company of Maine] and the very human tendency of corporate greed of some holding companies to 'milk' the earnings of subsidiary companies through 'dummy' directors, that it is the duty of this commission to limit strictly the amount of any such charges, which shall be only for the services rendered by such holding company, to the lowest reasonable charge for the services actually rendered. . . . The public at Springfield is paying the salaries of a competent manager and a competent secretary of defendant companies who reside at Springfield, and we do not think that the public should be called upon to pay for any other 'managerial services' or management by 'long distance,' from the New York office of the holding company in this case. No charge should be allowed for commissions, except for services actually rendered to the company, and that at no higher cost than the local company could employ the services of a competent independent engineer, provided that the manager in charge is not able and competent to render such service to the company himself. . . . We disallow any charge whatever for 'managerial services.'"

Fare Investigation on Manchester Street Railway

The Manchester (N. H.) Street Railway has filed a brief before the Public Service Commission in connection with the investigation that is being conducted by the commission to determine whether the railway can immediately be required to reduce its fares by the sale of school tickets and laborers' tickets during certain hours at 4 cents or 4 1/6 cents each. The brief states that the exhibits filed show such reduction would be in hours during which 37 per cent of the normal week-day riding is done and that it would mean a probable loss of one-fifth of the revenue from one-third of the ordinary week-day travel, being $25,000 to $30,000 annually.

The brief devotes considerable space to a discussion of the legal questions involved in the case, such as the value to be ascertained, appreciation, evidences as to value, reproduction cost, going value, overhead charges and depreciation. Looking at the evidence as to the value of the property of the Manchester Street Railway from these different viewpoints, the company states that the books as of June 30, 1913, show construction and equipment to have cost $1,431,633. On the same date the books showed the real capitalization and debt to be $1,402,750. The estimate of the cost to reproduce the entire plant compiled by the commission's engineer was $1,432,046 and as ascertained by the company's engineer $1,459,946. The commission's engineer made the depreciated present value $986,571, and the company's engineer made it $1,041,594. The brief states that the cost to reproduce would undoubtedly be greater than $1,500,000 and that the depreciated value cannot be less than $1,075,000. From the addition of $160,000 for appreciation and land values, the sum of $1,235,000 was obtained for the depreciated value of the property considered as a physical plant. To this sum $350,000 is added for working capital, giving $1,270,000 as a basis for rate making, without considering going concern values. The brief states that the railway paid no dividends on its capital stock for years, and averaged from the beginning 5.2 per cent, at least 0.8 per cent lower than the rate which the United States Supreme Court thought was the lowest that would not be confiscatory even for the peculiarly and favorably situated Consolidated Gas Company of New York. The Manchester Company, however, maintains that no public service corporation in New Hampshire ought to be limited to a lower return than 7 per cent upon the value of its property, which would give the basis for an allowance of $350,000 for going concern value. The total depreciated value of the property for rate-making purposes would therefore be $1,620,000. The company contends that on the evidence presented $1,500,000 is the minimum value of the property on which to figure a fair and reasonable return. At 7 per cent, which should be the lowest rate thought of as reasonable, the return would be $105,000, whereas the net profits for the year ending June 30, 1913, were only a trifle over $101,000. The company, however, asks that the commission declare that 3 per cent is as low a percentage for depreciation reserve as would be reasonable and that a proper allowance, not less than 3 per cent of the gross revenues, should be held out of the surplus to cover contingencies and unusual demands. On this basis the existing receipts of the company do not permit a reasonable return on the value of the plant after properly providing for its maintenance.

Social and Industrial Survey

The industrial economics department of the National Civic Federation has under way a comprehensive survey of the social and industrial conditions that have developed in the United States during the past generation. The object of the survey is to summarize the changes in the national life and to gather the essential material from which to judge where there have been advances or losses in the general well being, and how these have balanced or outweighed each other. The general conduct of the survey has been placed under the supervision of an executive council consisting of the officers of the National Civic Federation and the officers and chairmen of the committees of the industrial and economics department.

The main divisions of the inquiry cover the following subjects: Labor conditions, employers' welfare work, child labor, agricultural conditions, housing conditions, immigration, collective bargaining and methods of mediation and arbitration, educational opportunities, organized social service, distribution of ownership in investment, free speech and right of assembly, business ethics, political ethics, municipal government, judicial procedure, public health, enforcement of law and order, penal and correctional institutions, industrial profit sharing, social insurance, workmen's compensation, industrial loans and savings, foods and drugs, division of the people's income and the minimum wage. The following men known in the electric railway field are included among the committee members: Employers' welfare work—H. M. Byllesby, president of H. M. Byllesby & Company, Chicago, Ill.; Edwin M. Herr, president of the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., and T. P. Shonts, president of the Interborough Rapid Transit Company, New York, N. Y.; social insurance—M. W. Alexander, of the General Electric Company, Lynn, Mass.; industrial loans and savings—T. P. Shonts.

In connection with the above survey a special committee is making a study of employers' welfare work. This committee desires to learn what is being done for the welfare of employees in the broadest sense and it is endeavoring to obtain reports on the subject from every establishment. In order to assist the companies in preparing replies that they may overlook no essential point the committee has prepared an outline of activities which are found in various industries and in public employment. It is divided into eight main headings, as follows: Type of work; place; sanitation; recreation; education; housing; additions to wages; provident funds, and supervision of welfare work. Each one of these headings is subdivided into many details, and the committee requests full information in each report in regard to any of the items mentioned. Unmounted photographs are also desired for incorporation in the proposed permanent exhibit of the welfare department, which has for its purpose the providing of standards applicable to different industries.

Final Wisconsin Valuations

Final valuations and assessment of the property of street railways, and light, heat and power companies in Wisconsin operated in connection with them have been made by the Wisconsin tax commission. The total assessment is to be divided so that 15 per cent will be retained by the State and 85 per cent distributed through municipalities in which the utilities assessed are located. This division gives the State $121,515 and turns over to the towns, cities and villages affected $688,589. The statement of final assessments and taxes levied follows:

	Final Assessment	Taxes Levied
Ashland Light, Power & Street Railway	$525,000	$7,283
Bay Shore Street Railway	20,000	277
Beloit Traction Company	265,000	3,676
Chicago & Milwaukee Electric Railway	225,000	3,121
Chicago & Wisconsin Valley Railway	25,000	346
Chippewa Valley Light & Power Company	2,600,000	36,072
Duluth Street Railway	1,150,000	15,955
East Wisconsin Railway & Light Company	1,300,000	18,036
Grand Rapids Street Railroad	110,000	1,526
Ironwood & Bessemer Railway & Light Company	240,000	3,329
Janesville Traction Company	70,000	971
La Crosse & Onalaska Street Railway	20,000	277
Manitowoc & Northern Traction Company	120,000	1,664
Menominee & Marinette Light & Traction Company	320,000	4,439
Merrill Railway & Lighting Company	165,000	2,289
Milwaukee Electric Railway & Light Company	29,500,000	409,284
Milwaukee Light, Heat & Traction Company	7,700,000	106,830
Milwaukee Northern Railway	1,950,000	27,054
Rockford & Interurban Railway	340,000	4,717
Sheboygan Railway & Electric Company	1,050,000	14,567
Southern Wisconsin Railway	1,000,000	13,874
Waupaca Electric Light & Railway	95,000	1,318
Wausau Street Railroad	800,000	11,099
Wisconsin Gas & Electric Company	2,600,000	36,072
Wisconsin Electric Railway	700,000	9,711
Wisconsin Public Service Company	2,100,000	29,135
Wisconsin Railway, Light & Power Company	1,300,000	18,036
Wisconsin Traction, Light, Heat & Power Company	2,100,000	29,135

Inquiry Concerning Income Tax Law

At the annual meeting of the Central Electric Railway Accountants' Association held at Cleveland, Ohio, on Dec. 13, 1913, it was voted that a committee should be appointed to draft a letter to the secretary of the United States Treasury on behalf of the association requesting an early construction of certain parts of the income tax law. A committee composed of H. J. Davies, H. B. Cavanaugh and A. L. Kasemeier was later appointed and a letter was drafted and forwarded to Mr. McAdoo, but no answer has as yet been received.

The letter requested the construction or interpretation of the words "received," "accrued" and "paid" in Section H-G of the federal income tax law. The secretary was asked to state whether the phrase "gross amount of its income received from all sources during the year" means the amount of cash collected by a corporation or the amount of its earnings, whether collected or not, and also whether the phrase "the tax herein imposed shall be computed upon its entire net income accrued within each year" means net income actually "received." This, it is stated, would seem to be a necessary conclusion from the requirement that corporations report the amount of "gross income received," for "net income accrued" is inconsistent with this other term. There are also queries as to whether the phrase "paid within the year" includes other obligations than those actually paid in cash, and whether the word "paid" means actually paid, due, owing or accrued.

The treasury department was also requested to state whether a new company reporting for the first year of its operation is not to be permitted to deduct from its gross earnings those obligations or liabilities for damages arising from personal injuries, although it may not have paid a dollar within the year on account of such liabilities. It is pointed out that the phrase "paid and accrued within the year" occurs in connection with interest, but that the amount of interest paid within the fiscal year may not be the same as the amount accrued within the year, especially in cases where a bonded debt is contracted immediately after the expiration of the first half of the fiscal year and the interest is payable semi-annually. The letter states that all instructions on the back of forms add to the general confusion in regard to the terminology used in the law, and quotations are presented showing that authorities who have analyzed the law have taken different points of view on some of these questions.

Voters Approve Kansas City Franchise

The ordinance extending the franchise of the Metropolitan Street Railway, Kansas City, Mo., carried on July 7 by a majority of 6798. According to the semi-official count the vote stood 22,408 for and 15,610 against. Thirteen out of sixteen wards voted overwhelmingly in favor of the franchise. The proposition lost in three wards. The total vote was heavy, being about three-fourths of the registration. The fourth ward, which has been for W. R. Nelson for years, went in favor of the franchise by twenty-one votes. His precinct gave the franchise a majority of fifty-three.

Thousands of people thronged the streets Tuesday night to learn the result. A crowd of 5000 watched the returns from various wards thrown on the screen at the office of the Kansas City *Post*. A staff of fifty handled the returns at the office of the Metropolitan Street Railway. The local papers issued extras at 9 o'clock, giving the approximate results.

When it was definitely known that the franchise had carried, several thousand residents formed in line at Fifteenth and Grand Streets and paraded the principal streets for two hours. A brass band, with a goat as the leader, headed the procession.

The new thirty-year contract between the city and the company went into operation at 11 a. m. Wednesday. P. J. Kealy, representing the company on the board of control, and Robert P. Wood, representing the city, were installed by the receivers. The name of the company became the Kansas City Railways Company. The city's five directors were qualified. Ford Harvey and R. J. Dunham are the only directors selected so far for the company.

John M. Egan, president and general manager of the company, will retire in the near future. His salary of $25,000 will go toward paying the salaries of the board of control and the general manager. The members of the board of control will receive between $6,600 and $10,000.

James E. Gibson, who has been general superintendent of the company, will be general manager of the company. Mr. Gibson is thirty-two years old. He was born in Kansas City and completed his education at the University of Missouri. Frank Hagerman has been named temporary president of the new company, with six straw men as officers. Permanent officers will be elected as soon as the city's directors are named.

The receivers for the company have six months in which to complete the reorganization and remove the receivership.

Prior to the franchise election in Kansas City on July 7, indications were that the measure extending the franchise of the Metropolitan Street Railway for nineteen years would pass by a majority of about 5000. Late developments were particularly favorable to the measure. The publication of old correspondence between W. R. Nelson and the receivers for the company caused many who were undecided to fall in line for the franchise. This correspondence indicated that Mr. Nelson, owner of the *Star* and the *Times*, was a short time ago in favor of a franchise which included many of the provisions of that which went to the people on July 7.

Slightly more than 10,000 voters moved following the municipal election in April and were disfranchised on this account.

The newspapers of Kansas City devoted their final efforts to summing up the arguments for and against the franchise.

A number of meetings were held, the measure being discussed by Major Jost and others in detail. The *Journal* and the *Post* of July 5 carried full-page advertisements urging the public to vote for the franchise. On the same morning the *Star* asserted that a poll showed that the measure would be defeated.

Berlin Rapid Transit System

The annual report of the Berlin Elevated & Underground Railway, Berlin, Germany, for the year 1913, states that the present length of the company's own lines is 17 miles, and including the leased Schöneberg, Wilmersdorf and Dahlen municipal lines, 23.3 miles. The company also has obtained permission to operate two auto-bus lines in connection with its rapid transit service. Sixty buses are now on order and should be ready for operation in the spring. The company has also joined the Great Berlin Street Railway in taking a large stock interest in the Berlin Omnibus Company. This movement is in line with the tendency to eliminate ruinous competition.

The company carried on its own rapid transit lines during 1913 a total of 71,525,370 passengers, compared with 62,731,827 passengers in 1912. The increase was not for the same mileage, however, as the company opened three extensions during the year. The gross earnings were $2,345,812, as compared with $2,042,369 in 1912. The average earnings per passenger on the zone system were 3.28 cents, compared with 3.25 cents in 1912, the increase being probably due to the longer average ride on account of extensions. The largest number of passengers carried on any one day was 424,025, on which day the gross earnings were $15,110. During the year the company operated 2,566,781 train miles in trains of two to six cars. The rolling stock at the end of the year consisted of 226 motor cars and 174 trailers. A total of 2700 persons were employed on these lines. The company declared a dividend of 6 per cent.

New Los Angeles-San Bernardino Line.—The first train over the new line of the Pacific Electric Railway between Los Angeles and San Bernardino, Cal., a distance of about 60 miles, was to be run on July 11. The company has announced that eight trains will be run daily, covering the distance in two hours and twenty minutes.

Iowa "Blue-Sky" Law Unconstitutional.—The Iowa "blue-sky" law, providing for the regulation of investment companies, was held unconstitutional on July 6 by Judge Walter I. Smith of the United States Circuit Court for Iowa and by Judge Smith McPherson of the District Court of the United States for the southern district of Iowa.

Change in Office Location.—On July 1 the office of F. A. Healy, secretary and treasurer of the Ohio Electric Railway, was moved from Cincinnati to Springfield, Ohio. Mr. Healy will occupy space in the Ohio electric terminal and office building in Springfield, which is the headquarters of the general accounting and operating department of the company.

Expense of Relocation Not Recoverable.—The Court of Appeals of Maryland has decided that the State Roads Commission cannot recover from electric railways for expenses incident to relocating tracks incurred in building the system of State highways when using rights-of-way of the railway companies. The suit was brought by the commission against the United Railways & Electric Company.

Cause of the Salem Conflagration.—The cause of the spread of the fire at Salem is attributed to the large number of houses with shingle roofs, a kind of roof more common on the older structures in New England than on the newer structures, but widely used in all parts of the country. Railway structures rarely use this kind of roofing, but the conflagration at Salem supplies a strong argument against it for any kind of building.

Complaint of Cincinnati Companies Sustained.—On the complaint of the Cincinnati (Ohio) Street Railway and the Cincinnati Traction Company the Public Utilities Commission of Ohio has relieved the companies from the obligations imposed by the city in an ordinance passed Dec. 16, 1913, to require the Cincinnati Street Railway Company and the Cincinnati Traction Company to extend the Warsaw Avenue route over and along Glenway Avenue from Wilder Avenue to Seton Avenue.

The Toronto Purchase Agreement.—Some days ago the Council of Toronto, Ont., directed the Board of Control to report progress on the negotiations with the Toronto Railway concerning the framing of the purchase document. The Comptrollers referred the resolution to Corporation Counsel Geary and his coadjutor in the affair, D. E. Thomson. Mr. Geary has now announced that he had "reported" to the Board of Control, though he would not say that his communication embodies the agreement itself.

Railway-Ferry Transfers in New York.—The Board of Estimate and Apportionment of New York has approved the arrangement made with the New York Railways for free transfers at the Battery to and from the ferry boats of the municipal ferry between lower New York and Staten Island to the cars running to the Battery. No retransfers are to be permitted. Of each nickel the city will get 2 cents and the railway 3 cents. It is estimated that the contract may result in a loss to the city of $200,000 a year. The ferry rate is now 5 cents.

Terminal Improvements in Louisville.—Extensive improvements in terminal facilities of the southern Indiana electric railways of the Insull systems at Louisville, Ky., are thought to be assured in Louisville, judging by the statements made by Frank Smith, vice-president of the Interstate Public Service Company, which owns and operates the lines. Mr. Smith spent several days in Louisville going over the ground and interviewing Louisville shippers as to their complaints about lack of facilities to handle package freight for Indiana points over the electric railways out of that city.

Rockford Franchise Application Considered.—The City Council of Rockford, Ill., has authorized the Mayor and city clerk to retain an expert in public utility franchise and traction property values to report upon the properties of the Rockford City Traction Company before any action is taken in connection with the proposal to extend the franchise of the company for twenty years. While no suggestion was made in the resolution, Alderman Smith thought that it would be advisable to communicate with Walter L. Fisher, Chicago, regarding his possible retention. The proposal of the company for the extension of its franchise was referred to briefly in the ELECTRIC RAILWAY JOURNAL of June 20, page 1414.

Stockholders at Corporation Meeting.—The proceedings of the annual meeting of the stockholders of the United States Steel Corporation for its last fiscal year are the source of some striking information in regard to the participation of employees in the meetings of corporation stockholders. At the meeting in question there were present a number of workmen who were also stockholders in the corporation. These workmen made very interesting statements as to the conditions now effective in the steel industry in so far as the working conditions are concerned. The general trend of the remarks was that no better conditions could be found in any other plant in the country than those of the Steel Corporation.

Strike Conditions in Pittsburgh.—On July 1 an unsuccessful attempt was made to dynamite the home of E. M. Herr, president of the Westinghouse Electric & Manufacturing Company. This was an outgrowth of the strike at the three Westinghouse plants in East Pittsburgh. The Westinghouse Electric & Manufacturing Company, the Pittsburgh Meter Company and the Westinghouse Machine Company are offering employment to all classes of skilled labor and many men are reported to have been engaged. The strikers have adopted a resolution calling on Governor Tener to withdraw the state constabulary from the strike zone. On July 2 Mr. Herr conferred in New York with Guy E. Tripp, chairman of the board of directors. The results of this conference have not been made public.

PROGRAMS OF ASSOCIATION MEETINGS

The Tramways & Light Railways Association

The annual congress of the Tramways & Light Railways Association is to be held July 16-17 at Newcastle-Upon-Tyne, England. According to the preliminary program contained in the association bulletin, the papers to be presented before the members of the association on July 16 are as follows:

"Some Features of Newcastle Corporation Tramways," by Councillor R. Mayne, J.P., vice-chairman of the Newcastle Corporation Tramways Committee.

"Tramway Experiences in Brazil," by H. M. Sayers, M.I.E.E.

"Standard Tram Rails: A Comparison of English and Foreign Sections," by Fred Bland, member of the council.

On July 17 there will be two papers, as follows:

"Rail Joints: Their Construction and Maintenance," by R. Humphries, tramways engineer of the Birmingham and the Midland Tramways Joint Committee.

"Town Planning," by J. A. Brodie, city engineer, Liverpool.

International Street & Interurban Railway Association

The date for the next convention of the International Street & Interurban Railway Association has been set for the week beginning Sept. 6. The technical sessions will be held in the National Museum at Budapest. The following is the programme in brief:

Sept. 6, registration. 8 p. m., reception to delegates by committee.

Sept. 7 at 10 a. m., first technical session. Registration office will be open at 9 a. m. for the benefit of those delegates who have not already registered. In the evening, a reception by the municipality at the zoological gardens.

Sept. 8 at 9.30 a. m., second technical session. In the afternoon and evening, trip by train and boat on the Danube to Visegrad on invitation extended by the two local tramway companies in Budapest.

Sept. 10 at 9.30 a. m., fourth and final technical session. At 4 p. m., excursion by automobiles to the mountains in the neighborhood of Budapest.

At the conclusion of the session the choice of two excursions is offered to the delegates, one to Tatra, the other to Mezöhegyes.

New England Street Railway Club

The annual men's outing of the New England Street Railway Club will be held on July 14 and 15. The start will be made from Boston for Bangor, Me., from the North Station at 10 p. m. on July 13. The boat is scheduled to arrive at Bangor at 5.30 a. m. on July 14. At 6.10 a. m. the party will leave the Union Station at Bangor in special cars for the Conduskeag Canoe Club, where breakfast will be served. Between 9 and 11 a. m. the carhouses, substations and city lines of the Bangor Railway & Electric Company will be inspected.

Luncheon will be served at 1 p. m. at the Graham Farm, owned and operated by John M. Graham, president and general manager of the Bangor Railway & Electric Company. Between 2 and 5 p. m. there will be baseball and other athletic sports. The return to Bangor will be made at 7 p. m. There, at the Colonial Hotel, of which Mr. Graham is the proprietor, a banquet will be served at 7.30 p. m. On July 15 there will be an excursion to Orono and Oldtown and an inspection of the Veazie and Milford stations. The return to Boston will be made that afternoon, the boat being due to reach Boston at 6 a. m. on July 16. Arrangements for transportation can be made through the secretary of the club.

The expense each way will be $4 for fare, with charges of $1.50 to $2 additional for a stateroom.

LEGISLATION AFFECTING ELECTRIC RAILWAYS

MASSACHUSETTS

Governor Walsh has signed the bill relative to the amount of bonds, coupon notes and other evidences of indebtedness which may be issued by street railways, providing in effect that bonds may be issued up to 120 per cent of the outstanding capital stock of such companies.

The House passed without debate the resolve referring to the Public Service Commission the question of authorizing the consolidation of the street railways at Boston. The Senate committee on ways and means has recommended that the Massachusetts "blue-sky" bill be referred to the next General Court.

Financial and Corporate

Stock and Money Markets

July 7, 1914.

To-day was a 200,000-share day on the New York Stock Exchange. Early in the day there were evidences of activity, but as it proved the bulk of the trading was crowded into the last hour. The railroad issues responded quickly to the rate decision rumors. During the upward turn several fairly large lots of Pennsylvania were sold at more than 112. Rates in the money market to-day were: Call, 2½ per cent; sixty days, 2½@2¾ per cent; four months, 3@3¼ per cent; six months, 3¾@4 per cent.

The Philadelphia market was strong to-day and advances were recorded. Union Traction sold at 42 and Baldwin common was bid up to 46¾.

Trading was dull in Chicago to-day, but the tone was firm. Bonds held steady.

In the Boston market to-day lower levels were general. The tone was firm. There was considerable buying of Boston Elevated.

In Baltimore the stock transactions to-day totaled 1694 shares, quite well distributed. The bond sales were $49,000, par value.

ANNUAL REPORTS

Terre Haute, Indianapolis & Eastern Traction Company

The statement of income, profit and loss of the Terre Haute, Indianapolis & Eastern Traction Company for the year ended Dec. 31, 1913, follows:

Gross earnings from operation	$3,112,382
Operating expenses	1,719,908
Net earnings	$1,392,474
Taxes	128,049
Earnings from operation less operating expenses and taxes	$1,264,425
Income from other sources	289,029
Sale of power	95,368
Earnings from all sources less operating expenses and taxes	$1,648,822
Deductions and rentals:	
Bond interest:	
T. H. I. & E. Tr. Co.	$325,000
T. H. T. & L. Co	159,067
T. H. Elec. Co	75,000
I. & N. W. Tr. Co	123,500
I. & M. R. T. Co	37,500
I. & E. Ry. Co.	4,675
I. & G. R. T. Co	15,000
T. H. & W. Ry. Co	12,500
I. C. & D. Elec. Ry. Co	50,000
Total	$802,242
Dividends:	
T. H. T. & L. preferred	$54,496
T. H. & W. preferred	9,000
I. & N. W. preferred	22,500
I. C. & D. preferred	10,000
T. H. T. & L. common	100,000
T. H. & W. common	9,500
I. C. & D. common	4,000
Total	$209,496
Interest on notes	$23,932
Office maintenance—leased lines	3,000
	$1,038,670
Surplus	$610,152
Sinking fund	114,873
Balance	$495,279
T. H. I. & E. preferred dividend	455,000
Balance	$40,279

The operating expenses of the railway, light and power departments for the year 1913 were 55.26 per cent of the gross earnings. The taxes increased $25,003, making the total taxes 4.11 per cent of the gross earnings. The total operating expenses including taxes were 59.37 per cent of the gross earnings. An amount equal to 18 per cent of the gross earnings was applied to the maintenance of the owned and leased properties during the year 1913.

The expense on account of the floods during the last week of March, 1913, which partially destroyed a number of bridges and damaged the West Tenth Street power station, amounted to $102,566. In addition to this there was an estimated loss in revenue of $60,000. The loss in revenue to the Terre Haute, Indianapolis & Eastern Traction Company on account of the strike in the latter part of October was estimated at $25,000, in addition to $27,654 expense, or a total of $52,657.

During the year 1913 there was expended and charged to capital account for construction and added property the sum of $206,030. Of this sum $177,532 was expended on leased lines and $28,498 on owned lines. These expenditures cover construction work on the Terre Haute property, meters, transformers and lighting line extensions, additions to buildings and equipment, electric shovel, etc. Two new bridges were built on the Northwestern Division. A new 300-kw 600-volt d.c., General Electric Company unit was installed in the Maywood substation on the Martinsville division, and the high tension lines and substations on this division changed from 13,200 volts to 33,000 volts. The Y. M. C. A. building and ground at Crawfordsville were purchased at a cost of $18,000 and the building will be remodeled and used as a terminal station for the Crawfordsville division and the Lebanon-Crawfordsville branch of the Northwestern Division. During the year the work of installing block signals progressed, and 33 additional miles of road were equipped at a cost of approximately $1,500 per mile.

During 1913 the company invested in sinking funds of the various underlying companies the sum of $128,148. On Dec. 31, 1913, the par value of bonds held for sinking funds was shown to be $334,668. The full amount of dividend of 5 per cent was paid for 1913 on $9,100,000 of preferred stock of the Terre Haute, Indianapolis & Eastern Traction Company, making a total payment of $455,000. On April 1, 1914, it was decided that it would be inadvisable to pay the first 1914 quarterly dividend on account of the extraordinary losses and expenditures due to the flood and strike of 1913. The dividend was therefore deferred until these amounts should have been recovered from earnings.

Scranton & Wilkes-Barre Traction Corporation

The consolidated statement of income, profit and loss of the Scranton & Wilkes-Barre Traction Corporation, Scranton, Pa., and its subsidiary, the Lackawanna & Wyoming Valley Railroad, for the five months ended Dec. 31, 1913, follows:

Operating revenue	$279,671
Operating expenses	145,692
Net earnings	$133,979
Other income:	
Six months' interest on $888,000 Lackawanna & Wyoming Valley Rapid Transit Company bonds paid Aug. 1, 1913	$22,200
Interest on deposits	2,258
Total	$24,458
Total income	$158,437
Income charges:	
Taxes	$455
Hire of equipment	3,285
Miscellaneous rents	535
Interest on No. 6 Branch Erie & Wyoming Valley Railroad	1,000
Interest on $888,000 Lackawanna & Wyoming Valley Rapid Transit Company bonds (paid Aug. 1, 1913).	22,200
Five months' accrued interest on $2,112,000 first refunding 5 per cent gold bonds and $888,000 Lackawanna & Wyoming Valley Rapid Transit Company collateral trust bonds (payable Feb. 1, 1914)	62,500
Total	$89,975
Net income	$68,462
Other profit and loss credits:	
Profit and loss surplus, Lackawanna & Wyoming Valley Railroad for July, 1913	$9,207
Profit and loss surplus, Lackawanna & Wyoming Valley Railroad, as of June 30, 1913	15,392
Totals	$24,599
Total credits	$93,061
Profit and loss charges:	
Dividend No. 1 on Scranton & Wilkes-Barre Traction Corporation preferred stock	$14,167
Organization expenses (written off)	4,692
Total debits	$18,859
Profit and loss surplus, Dec. 31, 1913	$74,202

The gross earnings of the Lackawanna & Wyoming Valley Railroad for the calendar year 1913 showed an increase of $43,059, or 7.09 per cent, while the net earnings increased $35,522, or 12.84 per cent; the revenue from the transportation of passengers $32,731, or 6.32 per cent; freight revenue $7,090, or 10.04 per cent, and express revenue $1,416, or 19.89 per cent. The operating expenses showed an apparent increase of $7,537, but on account of the discontinuance on Sept. 30, 1912, of the practice of charging to maintenance of way and structures $1,000 monthly to cover expenditures for support of service, this increase was really $9,000 more, or $16,537. Maintenance of way and structures increased $21,160, the major portion of which was on account of replacement of ties and tracks. Maintenance of equipment decreased $2,784, which was generally distributed through the various items. Traffic expenses showed a small decrease, although a slightly larger amount was expended in advertising. Under transportation expenses the item of purchased power decreased $2,636. This was a reduction of 528,661 kw-hr. in the quantity purchased and a reduction in current consumption per car mile of 0.36 kw-hr. The expenses for operation of trains increased $2,600, there being an increase of nearly 45,000 car miles, more than half of which was made by passenger cars. Passenger train mileage increased only 20 miles for the year. The cost of operation per car mile showed a slight decrease. During the year 96,292 schedule trains were operated, of which 131, or 0.86 per cent, were delayed by trouble with their equipment. The general expenses decreased about $1,600, due partly to a lower rate for fire insurance and partly to changes in organization.

The report of the company contains a comparative tabulation of earnings and expenditures for the years from 1909 to 1913 inclusive, as well as a detailed schedule showing the analysis of operating expenses for 1912 and 1913. The percentage of operating expenses to gross earnings was 51.99 in 1913 as compared to 54.45 in 1912, and the percentage of operating expenses less depreciation to gross earnings was 47.97 in 1913 as compared to 50.13 in 1912. The number of revenue passengers carried in 1913 was 4,197,097; in 1912, 3,994,044; free passengers in 1913, 186,205; in 1912, 176,180; passenger earnings per mile of road in 1913, $24,349; in 1912, $22,903; passenger earnings per car mile in 1913, 35.69 cents; in 1912, 34.16 cents; total mileage of cars and locomotives in 1913, 1,836,224; in 1912, 1,791,599; operating expenses per car and locomotive mile, in 1913, 18.42 cents; in 1912, 18.46 cents.

Chicago Elevated Railway's Note Issue

The National City Bank of New York and the Illinois Trust & Savings Bank of Chicago are offering for sale at 98 and interest to yield 6.07 per cent $14,000,000 of Chicago Elevated Railway's two-year 5 per cent secured gold notes, dated July 1, 1914. These notes are issued by the Chicago Elevated Railways Collateral Trust, a voluntary association under Massachusetts laws controlling through stock ownership all of the elevated railways in Chicago. The notes will be redeemable as a whole on the option of the company on any interest date, Jan. 1 or July 1, on thirty days' notice at par and interest. The notes are specifically secured by a pledge under an indenture dated July 1, 1914, in favor of the Illinois Trust & Savings Bank as trustee of the following collateral: Northwestern Elevated Railroad, preferred stock, $4,943,300; Northwestern Elevated Railroad, common stock, $4,946,400; Metropolitan West Side Elevated Railway preferred stock, $8,706,300; Metropolitan West Side Elevated Railway common stock, $7,462,600, and South Side Elevated Railroad stock, $10,193,100, or a total of $36,251,700. These pledged securities, which represent an average of 99.88 per cent of the amounts outstanding, have been acquired by the Chicago Elevated Railway at an actual cash cost of $21,322,875.

Upon the basis of the valuation report on the elevated railways made by Prof. George F. Swain, Harvard University, in 1912, the management of the railways estimate the valuation of the properties represented by the above stock collateral as $84,386,294. On these properties there are outstanding $40,470,000 of underlying bonds, indicating that the equity pledged as collateral for these notes amounts to $43,916,294, or more than three times the total issue.

In connection with the present financing of these notes the Chicago Elevated Railways is to sell $7,000,000 of ten-year 6 per cent debentures at par. These debentures will be a general obligation of the company as junior, as to the pledged collateral, to the note issue. Inasmuch as an additional $16,000,000 was obtained from the sale of the shares of the Chicago Elevated Railways, its investment junior to these notes will amount to $23,000,000. The purchase of $12,500,000 of new first mortgage 5 per cent bonds of the Northwestern Elevated Railroad is to care for the balance of $30,000,000 of notes maturing July 1, 1914.

Brooklyn Rapid Transit Bond Conversion

The time for the conversion of the outstanding first refunding mortgage 4 per cent gold coupon bonds of the Brooklyn (N. Y.) Rapid Transit Company into stock expired on July 1. The company reports that on July 2 $5,220,000 par value of the bonds remained outstanding unconverted. The company had issued and outstanding in all $28,901,000 of the bonds. Up to Jan. 1, 1913, only one $1,000 bond had been converted. Thus in the period from Jan. 1, 1913, to June 1, 1914, $23,780,000 of the bonds were converted. As the stock is now on a 6 per cent basis the company will be called upon for the payment of the 2 per cent difference between the stock and the bonds on the amount of bonds converted, such payment totaling an additional $475,000, but reducing the fixed interest charge by $951,200. In short an annual fixed interest charge of $951,200 has been converted into a contingent dividend charge of $1,426,800. The conversion of the bonds brings the total amount of stock outstanding up to approximately $68,780,000.

On the whole it would seem that as many of the bonds were converted as could be expected. Undoubtedly a goodly number of the bonds was held by ultra-conservative investors to whom the present additional return to be secured and the prospects for a still greater return through conversion did not appeal. There must also be taken into consideration in this connection the bonds held by institutions which are precluded by law from holding stock, and then there are the bonds undoubtedly pledged as security for loans without the privilege of substitution of collateral. The bonds are now quoted at 83½ while the stock is at 91⅛. At these prices the bonds net 4.79 per cent and the stock 6.55 per cent.

Boston (Mass.) Elevated Railway.—Judge Dodge in the United States District Court at Boston has dismissed the bill brought by Amy Curtis, a stockholder of the West End Street Railway, to prevent the consolidation of that company with the Boston Elevated Railway under the act of 1911. Judge Dodge ruled that the act protects nonassenting stockholders by securing to them the right to a valuation of their shares by a jury if they desire and to payment of the ascertained value in money. He held the constitutional objections cited in the bill cannot be maintained.

Cleveland (Ohio) Railway.—The report of operation of the Cleveland Railway for May shows a surplus of $26,106, which, added to the interest fund of $369,835, increases the amount to $395,941. The allowance for operation through the summer months is 6 cents per car mile, however, and after June this is expected to reduce the interest fund materially.

Corpus Christi Street & Interurban Railway, Corpus Christi, Tex.—The negotiations for the consolidation of the Corpus Christi Ice & Electric Company, the People's Light Company and the Corpus Christi Street & Interurban Railway, begun more than a year ago, are reported to have been completed by Newburger, Henderson & Loeb, Philadelphia, Pa. These negotiations were referred to briefly in the ELECTRIC RAILWAY JOURNAL of Feb. 8, 1913.

Eastern Power & Light Corporation, New York, N. Y.—Lewis A. Riley, president of the Lehigh & Hudson River Railway, has been elected a director of the Eastern Power & Light Corporation.

Eastern Texas Electric Company, Beaumont, Tex.—Stone & Webster, Boston, Mass., are offering for sale at 95 and interest to yield 5.35 per cent, $200,000 of first mortgage collateral trust 5 per cent gold bonds of the Eastern Texas Electric Company, dated Nov. 1, 1912, and due Nov. 1, 1942. These bonds are of coupon issue in denominations of $1,000 and $500, with privilege of registration as to principal only, or fully registered without coupons in denominations of $5,000 or any multiple thereof. They are callable as a whole or in part for the sinking fund, at 105 and interest on any interest date. The sinking fund is made up of a payment of 1 per cent per annum of the bonds outstanding, the first payment being dated Nov. 1, 1917. The proceeds of the sale of these bonds will provide funds for the following purposes: Purchase of $100,000 of Beaumont Traction Company first mortgage 5's, which will give the Eastern Texas Electric Company $300,000 face value, or 50 per cent of the issue; the retirements of the present floating indebtedness of the Eastern Texas Electric Company amounting to $75,000, and certain additions and improvements to the properties of the subsidiary companies. In calling attention to this offer Stone & Webster emphasize the fact that the outstanding bonded debt, including the bonds now offered, amounts to less than 2½ times the gross earnings and that the net earnings at the present time amount to over 3½ times the bond interest charges. The bonds are followed by $500,000 of 6 per cent notes, $1,400,000 of preferred stock, paying dividends at the rate of 6 per cent, and $1,400,000 of common stock. The equity back of the bonds, as represented by present market prices of the junior securities, amounts to about $2,500,000. The Eastern Texas Electric Company controls besides the entire lighting and power business in Beaumont and Port Arthur, Tex., the Jefferson County Traction Company, operating an interurban railway 20 miles in length between Beaumont and Port Arthur.

Empire United Railways, Inc., Syracuse, N. Y.—An issue of $295,000 of 5 per cent first and refunding mortgage bonds of the Empire United Railways, Inc., under a $20,000,000 indenture to the Equitable Trust Company, New York, has been authorized by the Public Service Commission of the Second District of New York. The bonds are to be sold at not less than 85 to net $250,750.

Federal Light & Traction Company, New York, N. Y.—Of funds recently secured by the sale of 6 per cent notes, the Federal Light & Traction Company will devote $415,000 to extensions and betterments to plants of its various subsidiaries. At Trinidad, $110,000 will be used; around Tucson, $170,000 will be spent, of which $100,000 goes for powerhouse extensions, $40,000 for traction company improvements, $10,000 for gas extensions and $20,000 to extend the high-tension transmission service. A new street-lighting contract at Albuquerque calls for $15,000, while the $100,000 remaining of the amount appropriated for betterments will be spent upon track improvements for the Springfield Traction Company.

Interborough Rapid Transit Company, New York, N. Y.—Harris, Forbes & Company, Lee, Higginson & Company and Kissel, Kinnicut & Company, as syndicate managers, announced on July 7 that they had completed the sale of $20,000,000 of Interborough Rapid Transit Company bonds recently purchased from J. P. Morgan & Company. This lot makes a total of $50,000,000 of bonds sold by the syndicate in the past few months. The last $20,000,000 was placed at 99 and interest, an advance of one-half of 1 per cent over the offering price of the first $30,000,000.

Hudson & Manhattan Railroad, New York, N. Y.—The Hudson & Manhattan Railroad has applied to the Public Service Commission for the First District of New York for permission to issue $202,500 in bonds. The bonds are to be issued under the company's first lien and refunding mortgage for $65,000,000, to the Central Trust Company, approved by the commission in July, 1913, at which time an issue of $37,035,000 was authorized. The mortgage provided that the company, with the approval of the commission, might from time to time issue additional bonds to reimburse itself for expenditures made for additions and betterments. The present application states that the company, since the date of the mortgage, has expended for such purposes $202,579, and now desires to issue bonds for $202,500 for reimbursement.

Jacksonville Railway & Light Company, Jacksonville, Ill.—The Jacksonville Street Railway was incorporated recently to take over the present railway property in Jacksonville operated by the Jacksonville Railway & Light Company, provided that a new franchise is obtained in the city.

Lake Erie, Bowling Green & Napoleon Railway, Bowling Green, Ohio.—C. G. Taylor, receiver of the Lake Erie, Bowling Green & Napoleon Railway, has reported to Judge Killits. Mr. Taylor became receiver by appointment from Judge Killits ten months ago, in charge of the interurban lines east and west out of Bowling Green and the lighting and the heating plant of Bowling Green. Judge Killits is quoted as follows: "This company has been in the hands of receivers for more than three years and has been a losing proposition. Mr. Taylor's management of the road began in July, 1913. His first ten months of operation show a net surplus revenue above all expenses and deductions, except interest on bonds, of more than $6,000. In addition to this the physical condition of the company's plant, equipment and tracks has been greatly improved."

Mesaba Railway, Virginia, Minn.—The Mesaba Railway has been reincorporated under the laws of Massachusetts with $3,750,000 of authorized stock to succeed the Minnesota corporation of the same name. The stock will consist of 12,500 shares of 7 per cent preferred stock and 25,000 shares of common stock. Of the stock, 15,757 shares of preferred and 6850 shares of common are to be issued in exchange for the outstanding $1,100,000 of stock of the Minnesota corporation and $99,168 cash.

Pacific Gas & Electric Company, San Francisco, Cal.—The Pacific Gas & Electric Company has applied to the Railroad Commission of California for authority to issue $12,500,000 of first preferred stock and $5,000,000 of its general and refunding bonds. The company proposes to sell the stock at $82.50 per share. The company asks for authority to sell the bonds at a future date at a price to be determined later. The company has taken steps to amend its articles of incorporation so as to provide for the issue of first preferred stock. The company desires also to be granted authority by the commission to convert its present issue of $10,000,000 of preferred stock into first preferred stock after July 1, 1916, at the rate of 1.025 shares of first preferred stock for each share of the present preferred stock. The new first preferred stock which the company proposes to issue will be 6 per cent cumulative.

San Diego (Cal.) Electric Railway.—Authority to create a bonded indebtedness of $10,000,000 has been asked of the Railroad Commission of California by the San Diego Electric Railway. Of this amount the company desires permission to issue immediately and to sell, at a price not less than 90, bonds in the sum of $4,484,000. From the proceeds of this sale the company intends to use $1,805,555 to retire its outstanding indebtedness, which is $1,625,000. It also intends to sell, at not less than 90, $2,677,557 to pay indebtedness on a promissory note of $574,406; to return to income $302,438, which amount has been spent on betterments properly chargeable to capital, and to pay for contemplated construction the sum of $1,532,957. Out of the company's original bond issue of $5,000,000 of 1908 it states that $1,625,000 is its total outstanding indebtedness. The company also contemplates absorbing the Point Loma Railroad and the San Diego Coronado Ferry Company.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The Railroad Commission of California has rendered a preliminary order in the applications of the San Francisco-Oakland Terminal Railways for permission to issue additional bonds and notes. The applications now pending before the commission ask authority to issue $1,000,000 of general lien bonds to be pledged together with other collateral already pledged as security for an issue of outstanding notes, $500,000 of notes additional upon the collateral so pledged and $10,000,000 of first and refunding bonds. In rendering a preliminary order on these applications, the commission did so upon the representation that certain pressing obligations must be met by the company and because the physical valuation of properties now being made by the commission may not be completed before another sixty days. The obligations which the company desires to meet immediately include a preliminary payment of $60,000 on a new ferry boat to be used in carrying passengers from Oakland to the exposition grounds in San Francisco during 1915, and an initial payment of $100,000 on new cars for Oakland. The preliminary order of the commission permits the San Francisco-Oakland Terminal Railways, to issue its promissory notes for a period not to exceed one year in a sum not to exceed $650,000. The company is also authorized to issue $1,000,000 of its general lien bonds as collateral security for this issue of notes.

Shreveport (La.) Railways.—The Hibernia Bank & Trust Company, New Orleans, La., is offering at a price to yield 5.15 per cent, $800,000 of first mortgage 5 per cent serial gold bonds of the Shreveport Railways, dated July 1, 1914, and maturing $590,000 serially between 1918 to 1944. The bonds are all redeemable at 103 and interest on or after July 1, 1918. They are in the denominations of $100, $500 and $1,000. The Shreveport Railways is the successor to the Shreveport Traction Company, which in turn succeeded the Shreveport Belt Railway, and the Shreveport City Railway, chartered in 1870, and purchased the Highland Park Traction Company and the Shreveport Suburban Railway. The Shreveport Railways owns and operates the entire street railway system in Shreveport, consisting of 30 miles of track, over which nineteen single truck and nineteen double truck cars are operated. The deed of trust securing the present issue of bonds provides that no additional bonds can be issued unless the company earns at least three times its interest charges on all outstanding bonds, and then the additional bonds can be issued only for 80 per cent of the cash cost of extensions, etc.

Twin City Rapid Transit Company, Minneapolis, Minn.—The New York Stock Exchange has authorized to be listed the $1,900,000 of additional common stock of the Twin City Rapid Transit Company recently offered to stockholders at par on notice of payment in full, making the total amount authorized to be listed $22,000,000.

Wisconsin-Minnesota Light & Power Company, La Crosse, Wis.—The Wisconsin-Minnesota Light & Power Company, the successor to the La Crosse Gas & Electric Company, as referred to in the ELECTRIC RAILWAY JOURNAL of June 27, page 1475, is organized as follows: Joseph H. Brewer, president; W. B. Parsons and A. E. Peirce, vice-presidents; Blaine Gavett, secretary; C. A. Boalt, treasurer; W. J. Ripley, assistant secretary and treasurer; Messrs. Brewer, Parsons, Peirce, Gavett, Boalt, Charles B. Kelsey, A. W. Higgins, John H. Blodgett, Joseph S. Hart, George G. Whitworth and Charles McPherson, directors.

Dividends Declared

Cincinnati, Newport & Covington Light & Traction Company, Covington, Ky., quarterly, 1⅛ per cent, preferred; quarterly, 1½ per cent, common.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich., quarterly, 1½ per cent, preferred; quarterly, 1 per cent, common.

Dayton & Troy Electric Company, Dayton, Ohio, quarterly, 1¼ per cent, preferred; 1¼ per cent, common.

Georgia Light, Power & Railways, Macon, Ga., quarterly, 1½ per cent, preferred.

Green & Coates Streets Passenger Railway, Philadelphia, Pa., quarterly, $1.50.

Jacksonville (Fla.) Traction Company, quarterly, 1½ per cent, preferred; quarterly, 1¾ per cent, common.

Metropolitan West Side Elevated Railway, Chicago, Ill., quarterly, 1¼ per cent, preferred.

Ottumwa Railway & Light Company, Ottumwa, Ia., quarterly, 1¾ per cent, preferred.

Scioto Valley Traction Company, Columbus, Ohio, quarterly, 1¼ per cent, first preferred and preferred.

South Side Elevated Railroad, Chicago, Ill., quarterly, 1½ per cent.

Thirteenth & Fifteenth Streets Passenger Railway, Philadelphia, Pa., $6.

Traffic and Transportation

Chicago Electric Railways as Freight Carriers

The Chicago Municipal Markets Commission, appointed by the Mayor of Chicago, as noted in the ELECTRIC RAILWAY JOURNAL of April 4, page 797, to investigate market conditions in that city, has presented its preliminary report to the Aldermen and the Mayor. The document contains more than fifty pages and is of particular interest on account of the extended reference which it contains to electric railways as factors in controlling market conditions.

Under "Electric Street Railways as Freight Carriers" the commission says that trolley freight service with its cheap rates and practically house to house collection of farm products should be of enduring interest to the city consumer and to the producer. The urban and interurban railways should be operated for the benefit of the community in shortening the route between the producer of farm products and the consumer. Seven interurban electric railways enter Chicago or are connected with its surface or elevated lines, but only one, the Aurora, Elgin & Chicago Railway, has access to the loop district. The Aurora, Elgin & Chicago Railway handles considerable freight to and from the track connections with steam railroads, and brings into Chicago three carloads of milk daily to its freight terminus at Laramie Avenue, on the Metropolitan Elevated Railway. During 1913, 615 cans of milk and cream were brought into Chicago daily. The charge for this service is 15 cents per can between any two points on the company's line. The Chicago & Milwaukee Electric Railroad runs four express trains each day for the United States Express Company. A large portion of this company's express business consists of milk deliveries to Evanston and Milwaukee. These deliveries average about 300 cans each day. The bulk freight and merchandise traffic includes crushed stone, gravel and coal and averages approximately 150,000 tons annually, not including the freight hauled for company use. Freight traffic, however, is limited, owing to the restrictions in the company's franchises.

Speaking of the service on the other electric railways which enter Chicago and of the possibility of extending the service the report says:

"The Chicago & Interurban Traction Company, formerly known as the Chicago & Southern Traction Company, has its Chicago terminal at Sixty-third and Halsted Streets. The station is a joint one with the Englewood branch of the South Side Elevated Railroad. Direct connections are made at this point with the South Side Elevated Railroad and the Chicago City Railway for all parts of the city. This company operates its cars over the lines of the Chicago City Railway from the city limits of Chicago to Sixty-third Street. At the present time freight traffic is comparatively light owing to the fact that the company has not put its downtown freight terminal in service. As soon as this can be done, it is expected that the freight traffic will become very heavy owing to the quick delivery which can be made to the territory served by the Chicago & Interurban Traction Company's lines.

"By means of a traffic agreement with the Chicago & Eastern Illinois Railroad and the Chicago, Rock Island & Pacific Railroad, the Illinois Traction System makes shipments and deliveries from its lines to Chicago. A general agent's office is maintained in Chicago, and considerable freight for this 625-mile electric railroad system originates in this city. At the present time less than carload shipments average 20,000 lb. daily with the addition of isolated carload shipments, which include live stock, grain and fruit. The two steam roads connect with the Illinois Traction System at Glover and Peoria, Ill. At the former point cars may be interchanged, but at Peoria interchanged freight is handled to the electric line by teams. The important feature of this service to Chicago is the large number of flourishing Illinois cities touched and the fact that one-day delivery is made to all points on the electric line except St. Louis, and the completion of the Chicago, Ottawa & Peoria division of the Illinois Traction System in Joliet has given it an electric connection with Chicago.

"Among the electric roads in Michigan whose traffic is increased by boat line service to Chicago is the Grand Rapids, Grand Haven & Muskegon Railway. By advertising the fact that Chicago can be reached by way of the Goodrich boat line from Grand Haven a large amount of freight business has been developed. Freight traffic to Chicago includes all classes and averages approximately 100 tons daily in each direction.

"The Benton Harbor-St. Joe Railway & Light Company taps the rich Michigan fruit belt, and during the height of the fruit season thousands of bushels of fruit are delivered to the Graham & Morton boat line at Benton Harbor, from where it is shipped to Chicago and the territory lying to the west.

"The Chicago & Joliet Electric Railway operates through a territory having a population of more than 675,000 people outside of Chicago. No freight is carried in and out of Chicago on account of the distance of the company's terminal from the city's business district. Small quantities of bulk freight and express are handled from Joliet to points along the company's line.

"Although the Chicago, South Bend & Northern Indiana Railway has no lines into Chicago, its passenger and freight traffic is largely affected by its proximity to the city. The existing congested conditions at all steam road terminals seriously delay freight transfers from points east to points west of Chicago, necessitating at least two days to make the interchange of freight and get trains en route for the Northwest territory. The South Bend line has been able to take advantage of this delay by making a traffic arrangement with the various boat lines operating out of Michigan City, Ind., and Benton Harbor, Mich., to Chicago. Two loads of less than carload merchandise are delivered and received daily from boat lines at Benton Harbor. This boat line service makes it possible to save one day over steam road service to points west of Chicago. The boats deliver to trucks at Chicago. During the summer season from one to three cars of freight are delivered to boats at Benton Harbor daily.

"It is estimated that if the electric interurban lines are allowed direct access to the Chicago market, the cost for rapid, efficient service will be less than the cost of the present inferior service, due to the great cost of teaming and the delays at the railroad freight stations. The electric interurban railroad is better adapted for handling this class of foodstuffs because it operates more trains and makes stops convenient to the producer, as well as intensively developing this feature of its service. The steam roads have now more business in Chicago than they can handle with dispatch. The interurban electric railroad, with an eye to greater financial returns, will foster and promote its freight handling privilege to the utmost.

"All the interurban lines having termini in and near Chicago have facilities for bringing produce and garden truck to the people of Chicago more conveniently and rapidly than the steam roads. The city, therefore, should make arrangements under which interurban electric railways coming into the city limits will be permitted to carry express packages and farm products into and from Chicago over the lines of the existing street railway companies.

"A careful study of future relations of the steam railroad and the interurban electric railway indicates very strongly that the latter will largely handle a purely local freight and express business. It is urged that if the hauling of freight is limited to the night time, when the passenger trains are nearly all off the line, that this night operation of the freight traffic would not only assist in raising the sag in the powerhouse load curve, but would increase the gross business without adding materially to the fixed charges."

The report also refers to the handling of baggage and freight by electric railways in Massachusetts and to the service by the electric railways at Los Angeles, Cleveland and Philadelphia. A summary of recommendations of the committee contains the following paragraph in regard to the electric railways:

"In order to give the producer direct access to the markets of the city and to furnish the Chicago consumer with fresher and a more varied allotment of farm products, electric railway freight service should be placed in operation over the present existing street railway lines, and the interurban street railways should be given direct access to the city markets and to such other points in the city convenient to the consuming public for the delivery of fruits, vegetables and dairy products. The rapid and easy access to the new markets achieved by the establishment of street railway freight service to and from the city will encourage production, and the vast amount of land near the city of Chicago at present undeveloped will be divided into small truck, poultry, dairy and fruit farms. The time has arrived when our urban and interurban street railways should be operated for the benefit of the community in shortening the route between the producer of farm products and the consumer. The carrying of freight by street railway lines inside of the city limits, however, should not be permitted to interfere with the proper handling of the passenger traffic. Such freight cars should be operated during the hours when the passenger service is at a minimum and practically at a standstill, and they should be kept out of the congested district of the city. Freight handled by the interurban street railways could be carried over the Chicago street railways between the hours of 11 p. m. and 5 a. m. without inconvenience to the public. By permitting our street cars to carry freight during the night, street congestion in the day time will be lessened to a large extent by the elimination of a large amount of hauling by teams."

Trespasser Defined in New Jersey

In the case of Calvin Burns against the Atlantic City & Shore Railroad, Atlantic City, N. J., the Supreme Court of that State held recently that in proceedings under the act of 1911 for the prevention of trespassing upon railroad trains, and railroad property, it is necessary to prove a trespass contrary to the rules of the railroad corporation and an intention to ride without paying fare or to do the other acts mentioned in the statute.

Burns was convicted of a violation of the act of 1911 for the prevention of trespass upon railroad trains and railroad property. He had boarded a car at Pleasantville. The car was crowded. He had no seat and when the conductor demanded fare the prosecutor refused to pay until provided with a seat. None could be provided, so he remained on the car without paying fare although he might have alighted at two regular stops. The railroad company is incorporated under the general railroad law, but the custom was to collect fares on the car as in the case of street railways.

Many of the reports of this case which were published in the daily newspapers appeared under the caption "No Seat, No Fare Wins."

Don'ts for July 4.—The Pittsburgh (Pa.) Railways carried a full page advertisement in the Pittsburgh papers just previous to July 4 headed "Don'ts for July 4." The company referred to the unusually large crowds on the streets on July 4 and published a series of fifteen don'ts designed to protect its patrons and pedestrians.

State Board to Investigate Northampton Arbitration.—The Massachusetts Board of Arbitration and Conciliation has agreed to visit Northampton on July 7 to investigate its dispute between the Northampton Street Railway and members of the employees' union in connection with the interpretation of the recent finding of the local arbitration board. Commissioners C. G. Wood and F. M. Bump will sit in the case. Retroactive wages is the chief subject of discussion.

Adams Express on Detroit United Lines.—An arrangement has been made by which the Adams Express Company will handle the express business on the Detroit United Lines, succeeding the United States Express Company, which discontinued business on June 13. The Adams Express Company will establish agencies at all principal points along the electric railways included in the Detroit United Lines. Fast electric freight service will be maintained as at present on all the Detroit United Lines, the arrangement in regard to express business in no wise supplanting the regular freight service.

Traffic Regulation in Detroit.—Police Commissioner Gillespie of Detroit, Mich., is using his department to aid street car riders in the congested downtown district. He has marked off a number of "safety zones" at various heavy loading points on the lines of the Detroit United Railway, and these zones are protected with iron stands against vehicular traffic. The purpose is to keep a portion of the pavement clear for those boarding and alighting from cars and thus facilitate the handling of street car riders. In addition, the police commissioner has marked all the principal crossings in the congested district with heavy chalk lines.

Trial Belt Line Service Ordered at Boston.—Upon a petition of the Charlestown Improvement Association for improved service on the surface lines of the Boston Elevated Railway, the Massachusetts Public Service Commission has ordered that a three months' trial schedule be adopted which will include a loop line operated on a ten-minute headway in each direction from Sullivan Square to City Square, via Bunker Hill and Main Streets, and thence to Sullivan Square, with transfer privileges at City Square to and from Boston cars. The board also has ordered the trial installation for the above period of a ten-minute line between the top of Winter Hill and Summer Street, Boston, and a ten-minute line from Sullivan Square via Bunker Hill Street and the Tremont Street subway and Shawmut Avenue to Dudley Street.

Brooklyn Mail Contract Terminated.—Because the Brooklyn (N. Y.) Rapid Transit Company was unable to arrange satisfactory terms for renewing its contract with the Brooklyn post-office, for the transportation of letter carriers, the latter have been paying full fare since July 1. Postmaster William E. Kelly of Brooklyn has announced that the new plan of 5-cent fares for each ride will be tried for a period of three months. Tickets will be issued to the carriers for the payment of their fares to and from the stations while delivering and making collections. It is stated unofficially that the department hopes by the time the three-month experimental period is up to be ready to install automobile mail delivery service in Brooklyn. Under the arrangement which existed in Brooklyn the company received $25,000 a year for transporting the carriers.

Bay State Street Railway Fare Orders.—The Massachusetts Public Service Commission has ordered the Bay State Street Railway to rearrange its present fare limits so as to permit passengers to ride between the Braintree station of the New York, New Haven & Hartford Railroad and White's turnout in Holbrook for a 5-cent fare. The extension involved from the previous limit is about 0.5 mile. The commission has also ordered the company to provide 7-cent tickets good for passage between Middleton Square and Cabot and Dow Streets, Beverly, between 5.30 and 7.30 a. m., and 4.30 and 6.30 p. m., for the use of regular patrons traveling from any part of Middleton to any part of Beverly. The commission points out that similar tickets are in use between Middleton and Salem and that the company's revenue will not be materially reduced by the application of such a rate to the Beverly traffic.

New Fare System on New Jersey Line.—The Burlington County Transit Company, Mount Holly, N. J., has installed the fare registering system of the Rooke Automatic Register Company, Providence, R. I. The railway apprised the public of the change in display advertising which it carried in the daily papers. It said that the new system commended itself to any one willing to be shown. In explaining the advantages of the system to the passenger and to the conductor the company said: "The passenger pays his cash fare by easily paying his nickel into the hand-held register instead of placing same in the conductor's hand. The accustomed physical act of payment is not so much changed as merely utilized. The conductor is relieved of registering fares. Collection means registration and the instant possession of all cash, as usual. The entire transaction involving payment, registration and delivery is accomplished automatically and instantly at passenger's finger tips. All this saves time, and eliminates the old unavoidable annoyance of jostling passengers during the old 'ring up' process. The correct audit of all cash collected is no longer a matter of memory or optional intent. The conductor is relieved of mental accounting. Passengers cannot now 'ring up' fares by mistake, as formerly, or dispute regarding denomination of coin paid. The chance for honest financial error is eliminated along with any plausible basis for excusing intentional irregularities. This means a 'square deal' without casting reflections or imposing hardships."

Personal Mention

Mr. S. G. Cunningham has been appointed purchasing agent of the Arkansas Valley Railway, Light & Power Company, Pueblo, Col., to succeed Mr. George W. Milliken.

Mr. J. Dunhill has been elected secretary of the Tucson (Ariz.) Rapid Transit Company to succeed Mr. L. C. Gerry, who continues with the company as vice-president and treasurer.

Mr. W. J. Tharp, who has been auditor of the Little Rock Railway & Electric Company, Little Rock, Ark., has also been elected secretary of the company, to succeed Mr. George B. Rose.

Mr. L. C. Gerry, who has been secretary and treasurer of the Tucson (Ariz.) Rapid Transit Company, has been elected vice-president of the company and continues as treasurer but not as secretary.

Mr. W. W. Freeman has been elected vice-president of the Cincinnati, Newport & Covington Railway and the South Covington & Cincinnati Street Railway, Covington, Ky., to succeed Mr. P. G. Gossler.

Mr. C. S. Gannon, who has been secretary of the Birmingham-Tuscaloosa Railway & Utilities Company, Tuscaloosa, Ala., has also been elected treasurer of the company, to succeed Mr. W. S. Adams.

Mr. F. J. Beyer has been elected vice-president of the Winona Interurban Railway, Warsaw, Ind., to succeed Mr. William D. Frazer, who has been elected president and general manager of the company.

Mr. Claus Spreckels, who has been treasurer of the San Diego (Cal.) Electric Railway, has also been elected secretary of the company, to succeed Mr. H. L. Titus, who continues with the company as general counsel.

Mr. William D. Frazer, who has been vice-president and general manager of the Winona Interurban Railway, Warsaw, Ind., has been elected president of the company, to succeed Mr. H. J. Heinz. Mr. Frazer also continues as general manager.

Mr. S. C. Steinhardt has been elected president of the Wilmington, New Castle & Delaware City Railway, New Castle, Del., to succeed Mr. W. R. Brown. Mr. Steinhardt has also been elected president of the Wilmington Southern Traction Company, New Castle.

Mr. C. A. Pearson, Jr., who has been assistant treasurer of the Union Railway, Gas & Electric Company, Rockford, Ill., has also been appointed assistant secretary of the company, succeeding Mr. Jacob Hekma, who continues as an officer of the company with the title of treasurer and secretary.

Mr. J. W. Coleman has been elected president of the Coast Countries Gas & Electric Company, Santa Cruz, Cal., to succeed Mr. John Martin. Mr. Coleman, who has been general manager of the Union Traction Company, Santa Cruz, has also been elected president of that company, to succeed Mr. Martin.

Mr. George L. Mayer has been appointed purchasing agent of the Ohio Electric Railway, with headquarters at Springfield. The purchasing for the Ohio Electric Railway has heretofore been done by Mr. Claude Burckmyer, who also acted as purchasing agent for the Cincinnati Traction Company, the Ohio Traction Company and the Cincinnati Car Company.

Mr. T. B. Massey has been elected vice-president of the Wilmington, New Castle & Delaware City Railway, New Castle, Del., to succeed Mr. T. D. Rhoades. Mr. Massey has also been appointed general manager of the company. Mr. Massey has also been elected to the position of vice-president and general manager of the Wilmington Southern Traction Company.

Mr. Henry C. Hazzard has resigned as secretary of the Pacific Coast Electric Railway Association and will engage in the practice of law with offices in the Alaska Commercial Building, San Francisco. In this work he will be associated with Mr. T. T. C. Gregory, general counsel for the interests of Louis Sloss & Company, who are largely interested in the Northern Electric Railway, Chico, Cal., and other enterprises. Mr. Hazzard is a graduate of Leland Stamford, Jr., University and was admitted to the New York State Bar in 1899. Later for five years he was executive head of the division of light, heat and power of the New York Public Service Commission, First District, but resigned this office to become assistant attorney to the State Railroad Commission of California.

Prof. E. W. Bemis has been appointed as the city's representative on the Chicago Board of Supervising Engineers to succeed Mr. George Weston. The appointment has been approved by the Council. Professor Bemis is well known as a public utility expert and as an economist. He is at present engaged in supervising the valuation of the property of the public service corporations operating in the District of Columbia for the Public Utilities Commission of the District, and has been retained by the Detroit Street Railway Commission to appraise the property of the Detroit United Railway within the city of Detroit. Professor Bemis was born in Springfield, Mass., on April 7, 1860. He received the degree of A.B. from Amherst in 1880 and A.M. in 1884. In 1885 he received the degree of Ph.D. from Johns Hopkins University. He was professor of history and political economy at Vanderbilt University from 1889 to 1892 and was assistant professor of political economy at the University of Chicago from 1892 to 1895. In 1896 he served as assistant statistician of the Illinois Bureau of Labor Statistics, and from 1897 to 1899 was professor of economics, science and history at the Kansas State Agricultural College. Later he was director of the department of municipal monopolies of the Bureau of Economic Research in New York. From 1901 to 1909 he was superintendent of the water department of the city of Cleveland, Ohio. From January to October, 1910, he was deputy commissioner of water supply, gas and electricity in New York. Since 1910 Prof. Bemis has been engaged as a consulting expert in connection with problems affecting public utility properties.

J. F. Hamilton

Mr. James F. Hamilton, general manager of the United Traction Company, Albany, N. Y., and the Schenectady (N. Y.) Railway, was elected president of the New York Electric Railway Association at the annual meeting held at Hotel Champlain, Bluff Point, N. Y., on June 30 and July 1. Mr. Hamilton entered the transportation department of the International Railway, Buffalo, N. Y., in 1896, and after serving in various positions was placed in charge of one of the largest stations. He resigned his position with that company in 1902 to become assistant superintendent of the Schenectady Railway and was appointed superintendent of the company in 1909. In 1911 Mr. Hamilton was engaged as general superintendent of the United Traction Company, and was retained by the Schenectady Railway in an advisory capacity, and in 1912 he was appointed general manager of both companies. Mr. Hamilton has been active in the work of the New York Electric Railway Association for a number of years, and has served on the executive committee and as vice-president.

OBITUARY

Guy Phillips, assistant secretary and assistant treasurer of the Virginia Railway & Power Company, Richmond, Va.; secretary and treasurer of the Richmond & Chesapeake Bay Railway, and assistant secretary of the Missouri Pacific Railroad, killed himself by shooting at the office of Mr. Frank J. Gould, with whom he was associated in New York. Mr. Phillips had been identified with the Gould interests for many years. He suffered a nervous breakdown about ten years ago, but after a long rest in Germany he returned to the United States and resumed business apparently greatly improved in health.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Niobrara Electric Light, Power & Railway Company, Lincoln, Neb.**—Incorporated in Nebraska to build electric railways and other public utilities. Capital stock, $300,000. Officers: Hugh O'Neill, president; C. L. Keeler, vice-president; Carl E. Grant, secretary; John Korab, treasurer, and W. C. Grant, director.

FRANCHISES

Tuscaloosa, Ala.—The Birmingham-Tuscaloosa Railway & Utilities Company will ask the Council for an extension of time on its franchise in which to complete its electric line in Tuscaloosa.

Oakland, Cal.—The San Francisco-Oakland Terminal Railways have received a franchise from the Council for a double track on Telegraph Road in San Lorenzo, from the north line of Sycamore Street to Main Street.

Savannah, Ga.—The Savannah Electric Company has received a franchise from the Council to extend its line on Habersham Street from the present terminus southward to Forty-fourth Street to connect with the line at Chatham Crescent in Savannah.

Springfield, Ill.—The Southern Illinois & St. Louis Railway has asked the Illinois Public Utilities Commission for a certificate of convenience and necessity to build an electric railway between Marion, Harrisburg and Johnson City. [E. R. J., March 28, '14.]

Salina, Kan.—The Salina Street & Interurban Railway has received a franchise from the Council for an extension of its lines in Salina. The company also plans to build a new steel bridge. H. C. Smither, president.

Portland, Ore.—The application of the Portland Railway, Light & Power Company for approval of a line on East Eighth Street from Hawthorne Avenue to East Yamhill Street in Portland on which the company has a franchise, has not been approved by the Department of Public Works. Some suggestions have been made, however, which if followed will result in the immediate construction of the line.

Rock Hill, S. C.—The Carolina Traction Company has received a franchise from the Council for an extension of its tracks along Elm, Park and Crawford Streets in Rock Hill.

Nashville, Tenn.—The Nashville Traction Company will ask the County Court for a franchise for a right-of-way on the Murfreesboro turnpike from the city limits on LaFayette Street in Nashville to the town of Una.

Nashville, Tenn.—The Nashville-Gallatin Interurban Railway will ask the County Commissioners for an extension of time on its franchise in which to complete its line from the present terminus to the boundary of the county, passing through Goodlettsville. The purpose is to build a line to Ridge Top and Springfield, in Robertson County.

East Dallas, Tex.—Daniel Sonnentheil and associates have received a twenty-five-year franchise from the Council to build an electric line in East Dallas through the Lakewood addition, a distance of about 2 miles. [E. R. J., July 4, '14.]

Orange, Tex.—The franchise granted by the City Council of Orange to A. H. Hodges, C. F. Smythe and their associates giving them authority to build an electric railway and an electric light plant in Orange was formally accepted recently. It is intended to extend this line eastward to the town of Vinton and to the Vinton oil fields. [E. R. J., June 20, '14.]

Texas City, Tex.—The Texas City Street Railway has received a franchise from the County Commissioners in Texas City.

Salt Lake City, Utah.—The Utah Light & Railway Company has received a forty-one-year mail and express franchise from the Council in Salt Lake City.

TRACK AND ROADWAY

Northwest Arkansas Railway, Bentonville, Ark.—This company has placed in operation the 8-mile section of this line between Bentonville and Rogers. The line will be extended to Springdale, Pea Ridge and Cave Springs. H. L. Cross, Bentonville, secretary. [E. R. J., May 16, '14.]

Benicia, Cal.—Definite announcement that the construction of the Vallejo and Benicia electric railroad will be begun in a few weeks was made recently by officials of the Benicia Land & Terminal Company, recently incorporated. J. R. Cunningham, who is on the field in charge of operations, announces that the company had secured options on 1000 acres of land near the outskirts of the city for a terminal and repair shop. His statement that the line would ultimately be extended through the Vaca and Suisun Valleys into the Sacramento Valley is believed to mean that the line will connect with some other system, probably the Oakland, Antioch & Eastern Railway. The survey between Benicia and Vallejo has been completed. The line will have a terminal in Vallejo at the Monticello Steamship Company's wharf. [E. R. J., July 4, '14.]

San Francisco (Cal.) Municipal Railway.—The Bay View Improvement Club has asked the Board of Supervisors to extend the municipal line from Petrero Avenue to the Hunter's Point dry dock, the route to be along San Bruno, Oakdale, Railroad and Revere Avenues in San Francisco.

Peninsula Railway, San José, Cal.—Work will be begun at once by this company on the extension of its line from the corner of Franklin and Jefferson Streets to the town limits on the Saratoga road in Santa Clara.

Sacramento Valley West Side Electric Railway, Willows, Cal.—The third trestle on the 11-mile unit of this railway between Dixon and the station of Rio, on the Oakland, Antioch & Eastern Railroad has been completed and one-third of the track has been laid. The line is about 8 miles from Dixon. [E. R. J., June 20, '14.]

Norwich & Westerly Traction Company, Norwich, Conn.—During the next few weeks this company plans to build a new siding in front of the New York, New Haven & Hartford Railroad station at Westerly, R. I.

Albany (Ga.) Transit Company.—During the next few weeks this company plans to build about 1 mile of new track in Albany. All material has been purchased.

Chicago & Northern Interurban Railroad, Chicago, Ill.—This company, which plans to connect Chicago with the Fox Lake district, will shortly seek a franchise from the City Council of Chicago and a certificate of convenience and necessity from the State Public Utilities Commission of Illinois. The railway offers to exchange transfers with the city and elevated lines of Chicago if the franchise is granted. Both freight and passengers will be carried and the line will tap the dairy and truck garden districts between Chicago and Fox Lake. The business men of the general vicinity of Elston, Belmont and California Avenues in Chicago, working under the auspices of the Northwest Side Market Association, are back of the plan. [E. R. J., July 26, '13.]

Western Illinois Railway, Carthage, Ill.—Surveys are being made by this company for its line from Beardstown, Ill., to Burlington, Ia., via Fort Madison, Ia. G. T. Cappel, Augusta, Ill., is interested. [E. R. J., May 30, '14.]

Kewanee, Bradford & Henry Interurban Railway, Kewanee, Ill.—Plans are being made to finance this 35-mile railway to connect Kewanee, Osceola, Bradford and Henry. C. G. Lampman, Cedar Rapids, is interested. [E. R. J., June 27, '14.]

Mount Vernon Traction & Power Company, Mount Vernon, Ill.—About 2½ miles of track have been laid by this company in Mount Vernon. Charles C. Baldwin, Mount Vernon, chief engineer. [E. R. J., Dec. 6, '14.]

Waterloo, Cedar Falls & Northern Railway Company, Waterloo, Ia.—This company has just contracted with the Ohio Brass Company for 25 miles of catenary overhead work and hangers, and for 45,000-volt insulators for a transmission line of the same length. This overhead material is for use on the last link of this company's extension between Waterloo and Cedar Rapids, Ia.

Oklahoma-Kansas Railway, Baxter Springs, Kan.—Interest has been revived in the construction of the electric railway to connect Newkirk, Ponca City, Arkansas City, Blackwell, Enid, Perry, Kildare, Guthrie, Hunnewell, Guedo Springs and Tonkawa. The intention of the company has been to build first from Arkansas City, south to Ponca City, passing through the Chilocco School, Indian reservation, Newkirk and Kildare. C. F. Lambert, Kansas City, chief engineer. [E. R. J., Jan. 14, '11.]

Arkansas Valley Interurban Railway, Wichita, Kan.—Several extensions are being planned by this company. A line will be built north, either from Newton to Salina or from Halstead via McPherson to Wichita. An extension to Hutchinson will also be built. Work on these branch lines will not be begun until the fall.

Middlesboro, Ky.—It is reported that W. Godfrey Hunter, Middlesboro, has succeeded in interesting enough capitalists in the proposed 5½-mile electric railway to connect Middlesboro and adjoining towns to insure the construction of the line. [E. R. J., Oct. 18, '13.]

Blue Hill Street Railway, Canton, Mass.—During the next few weeks this company will award contracts to build a three-car siding in Canton.

Detroit (Mich.) United Railway.—The extension to Almont and Romeo has been placed in operation by this company.

Detroit, Lansing & Grand Rapids Railway, Detroit, Mich.—As soon as financial backing can be secured this company will begin work on its proposed 135-mile line between Grand Rapids and Detroit. Henry M. Wallace, 704 Union Trust Building, Detroit, vice-president. [E. R. J., Dec. 13, '14.]

Columbia, Mo.—David R. Francis, St. Louis, has consented to take securities of the proposed electric railway between Columbia, Mo., and other cities, if a franchise is secured. F. S. Mordaunt, Chicago, is promoting the railway, which includes a city system at Columbia. [E. R. J., July 4, '14.]

***Elizabeth, N. J.**—Active steps are being taken toward the establishment of an electric railway between Elizabeth, Rahway and Linden. At a recent meeting of the Elizabeth Board of Trade it was decided to take steps toward organizing a joint committee of citizens of Elizabeth, Rahway and Linden to form plans to build an electric line between these points. The Public Service Railway has refused to build a line between these towns.

Jersey Central Traction Company, Keyport, N. J.—Work will be begun at once by this company on an extension in Keansburg from its substation near Palmer Avenue, through Salina Place, down Carr Avenue, along the beachway and out to the end of the steamboat pier in New Point Comfort.

***Oklahoma City, Okla.**—Complete plans for a network of electric interurban railway lines in Oklahoma have been announced by C. B. Hale and J. W. Tippon. The lines are planned to be connected with the Union Traction Company lines at Independence and with the Dallas-Denton Interurban Railway. Present plans are to start with a capital of $15,000,000. The proposed railway would connect Oklahoma City, Sapulpa, Bartlesville, Tulsa, Muskogee, McAlester and various other Oklahoma cities. Two main lines are proposed, one to run from Independence, Kan., south through Muskogee to Denison and the other from Oklahoma City through Chickasha and Lawton to Wichita Falls, Tex. The first construction intended is from Tulsa east through Coweta, Broken Arrow and Wagoner to Muskogee, a distance of 52 miles.

Berlin & Northern Railway, Berlin, Ont.—Grading has been begun by this company for a ½-mile extension of its line in Berlin.

Blenheim, Ont.—At a representative meeting in Blenheim on June 30 steps were taken to have the Hydro-Electric Power Commission of Ontario report upon a hydro-radial railway from St. Thomas to Amherstburg, to serve the district lying along the north shore of Lake Erie. A permanent organization was formed, with Mayor Little, Blenheim, as president.

Bridgeburg, Ont.—Engineers have been asked to survey the route for the proposed Bridgeburg-Port Colborne electric line, decided upon by the Ontarion Hydro-Radial Commission.

Morrisburg & Ottawa Electric Railway, Ottawa, Ont.—This company is advertising for bids for the complete construction, equipment, right-of-way of its line of railway, which will begin at or near Ottawa, and extend to Chesterville, a distance of about 35 miles, such bids to be based on the company's plans and specifications. L. Von Sydow, engineer in charge.

Sudbury-Copper Cliff Suburban Electric Railway, Sudbury, Ont.—About 2 miles of grading has been begun by this company on the route which extends parallel with the Copper Cliff Road, 5 miles. Further proposed extensions include the Ramsay Larke road, 1.2 miles, and the Frood Mine road, 2 miles. C. D. Norton, Sudbury, engineer.

Lehigh Valley Transit Company, Allentown, Pa.—This company is rebuilding about 7 miles of track in Phillipsburg, N. J., with 105-lb. Dudley Section Tee Rails, in 60 ft. lengths, laid on creosoted ties, Abbott joints, and stone ballast.

Hanover & McSherrystown Street Railway, Hanover, Pa.—Arrangements are being made by this company to award contracts for building its proposed line from Conewago Chapel to New Oxford, a distance of about 4 miles.

***Kane, Pa.**—Plans are under way to build an electric railway to connect Kane, St. Mary's, Johnsonburg and Ridgway, a distance of 33 miles. A large power plant is to be built near Ridgway to supply power for this proposed line.

Schuylkill (Pa.) Railway, Girardville, Pa.—Plans are being considered by this company to extend its lines into Delano and Lakeside, via Park Place.

Cumberland Valley & Interurban Electric Railway, Nashville, Tenn.—Preliminary arrangements are being made by this company to build its 80-mile line between Nashville and Sparta via Smithville, with branches to Lebanon, Woodbury and McMinnville. W. G. Baird, Lebanon, president. [E. R. J., March 14, '14.]

Nashville (Tenn.) Traction Company.—An amendment to this company's charter has been authorized to increase its capital stock from $500,000 to $1,000,000, and to construct, acquire and operate electric railways and extensions of its present lines upon a number of highways of the city and county and through private property. The Detroit-Nashville Construction Company, which was organized for the purpose of building the lines of the Nashville Traction Company, has also been authorized to increase its capital stock from $100,000 to $300,000. W. O. Palmer, Nashville, president. [E. R. J., July 4, '14.]

El Paso (Tex.) Electric Railway.—This company is reported to contemplate extending its lines in El Paso.

***Fort Worth, Tex.**—F. W. Ferguson, New York, E. E. Fosdick, Fort Worth, and associates, are considering plans to build an electric railway from Fort Worth to Mineral Wells, 60 miles.

Gainesville, Whitesboro & Sherman Railway, Gainesville, Tex.—This company is desirous of interesting outside parties in the railway with a view to its construction and operation. The line was promoted originally in 1906. Franchises and rights-of-way have been obtained and surveys made. Twelve miles of the line have been graded. William L. Blanton, Gainesville, Tex., is attorney for the company. [E. R. J., April 18, '14.]

Southwestern Traction Company, Temple, Tex.—Extensive improvements are under way on all the lines within the city limits of Temple.

Victoria, Tex.—The project to build an electric line between Victoria and Houston, Tex., has been revived. The railway, if built, will touch Sugarland, Richmond, Rosenberg, Wharton and other cities. John T. Land, secretary of the Victoria Chamber of Commerce, is among those interested.

***Wichita Falls, Tex.**—Plans are being considered to build a 170-mile electric railway to connect Dallas, Denton, Bowie, St. Jo, Grapevine, Decatur, Henrietta and Gainesville. The Southern Traction Company and the Texas Traction Company will offer to the proposed Wichita Falls-Dallas interurban line interchange of service and inter-line tickets, according to J. F. Strickland, president of the two companies. Among those interested in the project are J. A. Kemp and C. H. Boedeker.

Janesville & Madison Traction Company, Madison, Wis.—Right-of-way has been secured by this company between Edgerton and Stoughton and plans are being made to begin the construction of this section of the line in the near future. G. Pickhardt, 409 Washington Building, Madison, president. [E. R. J., June 13, '14.]

Southern Wisconsin Railway, Madison, Wis.—The Railroad Commission has ordered this company to construct within the next ninety days double tracks on Williamson Street, Park Street and on University Avenue, from Park Street to the crossings of the tracks of the Milwaukee road on Mills Street, and from University Avenue to a point near West Johnson Street in Madison.

SHOPS AND BUILDINGS

San Francisco (Cal.) Municipal Railway.—Construction of this company's new carhouses, to be located on the block bounded by Seventeenth, Mariposa, York and Hampshire Streets in San Francisco, will soon be begun. The Board of Public Works has called for bids for excavating the site.

Norwich & Westerly Traction Company, Norwich, Conn.—During the next few weeks this company plans to build an addition to its passenger station at Stonington, to be used as a freight house with siding.

Utah Light & Railway Company, Salt Lake City, Utah.—Plans and specifications are being prepared by this company for an addition to its carhouses in Salt Lake City. The addition will cost about $50,000.

POWER HOUSES AND SUBSTATIONS

Pacific Gas & Electric Company, San Francisco, Cal.—New equipment to be installed in this company's power plant in Oakland in the near future will consist of one 1000-kw, 600-volt generator on common base shaft with one 1440-hp, 11,000-volt, three-phase, sixty-cycle, 514 r.p.m. synchronous motor generator set. This apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Peoples Traction Company, Galesburg, Ill.—A new substation is being built by this company in Abingdon and a 300-kw rotary converter is being installed. It is expected to have this station in operation by Aug. 1.

Winona Interurban Railway, Warsaw, Ind.—This company is considering plans to buy stokers for four 300-hp Babcock & Wilcox boilers for its power plant in Winona Lake.

St. Paul Southern Electric Railway, St. Paul, Minn.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for one 300-kw, 600-volt, three-phase, sixty-cycle, 1200 r.p.m. rotary converter; three 100-kva, single phase, sixty-cycle, 13,000-volt to rotary voltage OISC transformer and one switchboard to control same.

Water, Light & Transit Company, Carrollton, Mo.—During the next two months this company plans to purchase one 250-hp Heine type boiler and a new boiler feed pump for its power plant in Carrollton.

Jamestown, Westfield & Northwestern Railway, Jamestown, N. Y.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for the following apparatus: one complete, portable substation consisting of one 500-kw, 600-volt, six-phase, twenty-five-cycle, 750 r.p.m. rotary converter; one 550-kva, three-phase, twenty-five-cycle, 16,500-volt to rotary voltage OISC outdoor type transformer; one two-panel switchboard to control the above, and one substation car complete.

Philadelphia (Pa.) Rapid Transit Company.—This following new equipment will be installed by this company at its power plant in Philadelphia: two 3000-kw, 600-volt, six-phase, twenty-five-cycle, 250 r.p.m. rotary converter; six 1100-kva, single-phase, twenty-five cycle, 13,200-volt, rotary voltage air blast transformer. This order was placed with the Westinghouse Electric & Manufacturing Company.

Northern Texas Traction Company, Fort Worth, Tex.—One 1000-kw, 600-volt, six-phase, twenty-five cycle, 750 r.p.m. commutating pole rotary converter will be installed by this company at its power plant in Fort Worth. The apparatus was ordered from the Westinghouse Electric & Manufacturing Company.

Manufactures and Supplies

ROLLING STOCK

Sioux City Service Company, Sioux City, Ia., is building eight new cars in its own shops.

Fargo & Moorehead Street Railway, Fargo, N. D., expects to purchase one single-end equipment car.

Canadian Northern Railroad, Toronto, Ont., noted in the ELECTRIC RAILWAY JOURNAL of April 4, 1914, as being in the market for eight all-steel suburban passenger cars for its Montreal tunnel electrification, has ordered these cars from the Pressed Steel Car Company.

Sacramento Electric, Gas & Railway Company, Sacramento, Cal., has ordered six city passenger cars from the American Car Company. This item is a correction of a previous report on this order in the ELECTRIC RAILWAY JOURNAL of July 4, in which an error was made in the name of the car builder. The trucks will be mounted on Brill No. 76 E trucks instead of No. 75 E, as formerly specified.

Charlotte (N. C.) Electric Railway, noted in the ELECTRIC RAILWAY JOURNAL of May 9 as having ordered six closed city cars from the Southern Car Company, has specified the following details for this equipment:

Seating capacity	40	Bumpers	Hedley
Weight of car body	12,000 lb.	Car trimmings	bronze
Bolster centers, length,	17 ft. 9½ in.	Curtain fixtures	Natl. L.W.
		Curtain material	Pantasote
Length of body	27 ft.	Destination signs	Hunter
Length over vestibule	37 ft.	Gongs	12 in.
Width over sills	8 ft. 4 in.	Hand brakes	vertical wheel
Width over all	8 ft. 7 in.	Motors	outside hung
Height, rail to sills	32 in.	Sash fixtures	Natl. L.W.
Body	metal	Seats	willow
Interior trim	mahogany	Seating material	rattan
Headlining	Agasote	Step treads	anti-slip
Roof	arched	Trucks	maximum traction
Underframe	metal	Ventilators	Ry. Utility
Air brakes	West.		

TRADE NOTES

Taylor-Wharton Iron & Steel Company, Seattle, Wash., has moved its offices from 319 Pacific Building to 1604 L. C. Smith Building.

Carbo Steel Post Company, Chicago, Ill., has moved its offices from Chicago Heights, Ill., to 879-881 Rand-McNally Building, Chicago, Ill.

Union Switch & Signal Company, Swissvale, Pa., has appointed T. W. Siemon as secretary and treasurer, to succeed J. H. Johnson, recently resigned.

Joseph Dixon Crucible Company, Jersey City, N. J., has appointed Dudley O. Johnson as branch manager of its Chicago office, succeeding the late Sam Mayer.

Lawrence Steel Casting Company, Pittsburgh, Pa., has appointed H. W. Green as vice-president. Mr. Green has been for the past ten years district sales agent for the American Steel Foundries, Pittsburgh, Pa.

St. Louis Car Company, St. Louis, Mo, has received an order for seats for the fifteen cars which were recently ordered by the Jacksonville (Fla.) Traction Company from the American Car Company.

N. W. Halsey & Company, New York, have published a small pamphlet entitled "How to Select a Good Bond." It discusses briefly the question of the accuracy of a bond circular, the work of a corporation lawyer, the report of the engineering firm, franchises, territory served, population and certification by public accountants.

Harry C. Holloway, who has represented The Rail Joint Company, both in Cincinnati and Chicago, for several years, resigned on July 1. Mr. Holloway has opened an office at Room 647, Railway Exchange Building, where he will handle railway supply accounts representing among others, the Keystone Grinder & Manufacturing Company, Pittsburgh, Pa.

Glass Founders Corporation, Inc., New York, N. Y., has opened an office at 20 Exchange Place and has secured patents for the manufacture of a new composition of glass for use in vestibules and windows of street and interurban cars and for other purposes. This glass combines the features of unusual strength and safety. When broken it merely pulverizes and will not cut any one.

William H. Heulings, Jr., who was elected last week vice-president of The J. G. Brill Company, has been identified with that company for his entire business life, and the election will give pleasure to the hosts of friends which he has acquired during his long association with the electric railway industry. As a representative of his company, he has attended nearly every national convention in the steam and electric railway field during the last twenty-five years at which his company has had an exhibit. His technical knowledge of the car building and truck industry and his wide acquaintance and popularity in the transportation field well fit him for his present position. Mr. Heulings became connected with The J. G. Brill Company on Feb. 7, 1885, when slightly more than fifteen years old, and he was first engaged to fill a temporary position as a stenographer. At that time he was preparing for a course at the University of Pennsylvania, but after he had been with The Brill Company a short time, at the suggestion of James Rawle, then treasurer of the company, he decided to give up his university career and put forth all of his energies in developing the business of the company. After working for five years directly under Mr. Rawle, Mr. Heulings went to the sales branch of the business, where he came under the direct supervision of John A. Brill, through association with whom his natural qualities of salesmanship were broadened. He was made assistant secretary of the company in 1901, and in 1903 he assumed, in addition, the duties of general manager of sales. Aside from his office of vice-president of The J. G. Brill Company, he is president and director of the John Stephenson Company and vice-president and director of the G. C. Kuhlman Car Company. Besides his active business connections, Mr. Heulings is a member of a great many clubs, including the Racket and Art Clubs of Philadelphia, the Franklin Institute of that city and the Railroad Club of New York. He has also always taken a great interest in the affairs of the American Electric Railway Manufacturers Association and is a past president of that organization and has served for a number of years as an active and efficient member of the executive committee.

W. H. Heulings, Jr.

ADVERTISING LITERATURE

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued a catalog describing its lumber crayons.

S. K. F. Ball Bearing Company, New York, N. Y., has issued a catalog describing the principles of its ball bearings.

Railway Improvement Company, New York, N. Y., has issued a folder entitled "The Microbe that Clings Joyously to the Ordinary Leather Strap."

Hess-Bright Manufacturing Company, Philadelphia, Pa., has issued a folder which contains a list of its distributers who handle a complete line of its ball bearings.

Welding Materials Company, Inc., New York, N. Y., has issued folders describing its welding materials and apparatus for electric arc, butt, spot and oxy-acetylene welding.

Electrose Manufacturing Company, Brooklyn, N. Y., is distributing copies of the *Scientific American*, issue of May 16, 1914, which contains an article on the evolution of the high-tension insulator in which diagrams are shown of insulators of the type manufactured by this company.

Esterline Company, Indianapolis, Ind, has issued catalog No. 321 describing in detail its graphic efficiency meters for making continuous records on charts of any varying quantities, such as speed, temperature, pressure, speed per minute, miles per hour, volts, amperes, kilowatts or horsepower.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued a catalog describing Baldwin-Westinghouse industrial locomotives. The catalog shows a number of installation views of this class of apparatus and also contains a description of the characteristics of the locomotives.

Duff Manufacturing Company, Pittsburgh, Pa., has issued a general catalog of its line of jacks and other apparatus. This catalog, which contains 144 pages, describes its various types of standard trip jacks, car jacks, geared emergency car jacks designed especially for the equipment of electric railways, high-speed, ball bearing screw jacks, forged steel hydraulic jacks, trench braces and armature lifts.

Brown Hoisting Machinery Company, Cleveland, Ohio, has issued a catalog describing and illustrating its suspended concrete bins for handling coal and ashes in power plants. Numerous illustrations of installations of bins are shown in the catalog, among them being the Winnipeg (Man.) Electric Railway, Memphis (Tenn.) Street Railway and the Cleveland, Painesville & Eastern Railroad.

Ohmer Fare Register Company, Dayton, Ohio, has issued a booklet entitled "The Proof of the Pudding Is in the Eating," which directs attention to a number of repeat orders for registers which have recently been received from the following electric railways: Pacific Electric Railway; Portland (Ore.) Railway, Light & Power Company, San Francisco-Oakland Terminal Railways and the Southern Pacific Railroad.

Bowman, Cost & Company, St. Louis, Mo., recently issued a special investment bulletin in sheet form containing carefully selected lists of railroad bonds, public service bonds, municipal bonds and miscellaneous corporation bonds that are good offerings at the present time. Some of the larger issues are the following: Chicago (Ill.) City Railway first mortgage 5's, Interborough Rapid Transit first and refunding 5's, Los Angeles (Cal.) Railway first and refunding 5's, United Railways of St. Louis general first mortgage bonds and Springfield (Mo.) Railway & Light first refunding 5's.

Stone & Webster, Boston, Mass., have issued a detailed circular describing bonds, coupon notes, preferred stocks and common stocks of companies managed by the Stone & Webster Management Association which are recommended for purchase at this time. Among the securities mentioned are the following: Six per cent cumulative first preferred stock of the Dallas (Tex.) Electric Company; 6 per cent cumulative preferred stock of the Dallas & Houston Electric Company; first consolidated mortgage 5 per cent gold bonds of the Jacksonville (Fla.) Traction Company; 6 per cent cumulative preferred stock of the Puget Sound Traction, Light & Power Company; 6 per cent cumulative preferred stock of the Public Service Investment Company; collateral trust sinking fund 5 per cent gold bonds of the Railway & Light Securities Company, and capital stock of the Capital Electric Company.

NEW PUBLICATIONS

Five Lectures Concerning Transportation.—Written and published by Logan G. McPherson, Baltimore, Md., 1914. 110 pages, paper bound.

Mr. McPherson is chief of the Bureau of Railway Economics at Washington, D. C., which is supported by the steam railroads of the United States, and the five lectures in this book were delivered at The Johns Hopkins University in 1914. They include the following subjects: The economic transition; railway competition and combination; government ownership of railways; the valuation of railways and the service of accounts and statistics. Mr. McPherson's conclusion in regard to railway competition and combination is that practical as well as ethical considerations would seem to be all in favor of such combinations of railways as will enable them best to serve the needs of industry and commerce, most efficiently and economically perform the function of transportation and most satisfactorily adjust the questions that arise with shippers, with railway brotherhoods and with governmental legislative and regulatory bodies. The most interesting lecture is undoubtedly that dealing with government ownership of railways. In regard to a choice between regulation and public ownership Mr. McPherson makes the following pertinent remarks: "There is an old saying that if you want a thing done right you must do it yourself. That dictum has a limited application to the things done wholly by oneself in one's own interest, and frequently does not hold good even within this limit. When it comes to administration, and especially to the direction on a large scale of the processes of a large organization, it is much easier to pick flaws than to perform, to criticise than to do, and this is the principal reason why it is better that the large business of this country be regulated by the people than administered by the people." Two additional points which the author specifically mentions are that it is almost inevitable that the tremendous voting power of the rank and file of employees under government ownership would cause their vote to be sought by politicians with various promises of increases in pay and easier working conditions, and that if the government were to take over and operate the railroads with the same degree of business inefficiency and business laxity that has characterized other phases of the administration it would not be many years before taxation would bear heavily upon every taxpayer. The lecture devoted to the subject of the valuation of railways is a general discussion of the economic aspects of railroad valuation, the relation that railroads bear to the public and the present uncertainty as to what constitutes the fair value of a railroad.

State Regulation of Public Utilities; published by the American Academy of Political and Social Science, Philadelphia. 357 pages.

The May number of *The Annals* of the American Academy of Political and Social Science contains a collection of articles, largely from commission sources, dealing with the State regulation of public utilities. The papers are grouped under seven headings, as follows: (1) legislation as to State public utility commissions; (2) State regulation and municipal activities; (3) uniform accounting and franchises; (4) public control over securities; (5) valuation of public utilities; (6) electric and water rates, and (7) standards for service. The authors include William D. Kerr, director Bureau of Public Service Economics, New York City; Frank W. Stevens, chairman of valuation committees, New York Central Lines, New York; John M. Eshleman, president Railroad Commission of the State of California; Edwin Grühl, assistant to the president the North American Company; and Halford Erickson, member Wisconsin Railroad Commission.

New Transfers in St. Louis

Reference has been made previously in the ELECTRIC RAILWAY JOURNAL to the new transfer system put into effect by the United Railways, St. Louis, Mo., on July 1. The company conducted a campaign of education in the newspapers before the system was installed. One of the paid advertisements inserted in the St. Louis papers by the company over the signature of Robert McCulloch, president and general manager, follows in part:

"On July 1, 1914, the old form of transfer will be abandoned and a new transfer substituted. The new transfer is intended to be used so as to 'transport passengers by a continuous trip from any point on the system to any other point on the system.'

"Please do not fold or roll the transfer. The conductor's work will be greatly expedited and the passenger's comfort thereby subserved if the transfer is allowed to remain as issued by the conductor.

"Only one form of transfer will be used, which will contain a list of all the lines in the city, the issuing line being conspicuously printed on each transfer. Two colors will be used, green and lavender. The green transfer will be used when only one transfer is needed or when a third transfer is necessary; the lavender transfer will be used when two or more transfers are required to transport a passenger to his destination; the green transfer is always used singly, the lavender always double.

"We repeat the request that both passengers and conductors exercise patience until all become familiar with the issue and use of the transfer by which the company means in good faith to 'transport passengers by a continuous trip from any point on the system to any other point on the system.'"

Vol. XLIV NEW YORK, SATURDAY, JULY 18, 1914 No. 3

AXLE STEEL SPECIFICATIONS

In last week's issue we printed an abstract of the new specifications for forgings for heat-treated axles which were presented by a committee of the American Society for Testing Materials at the Atlantic City meeting and were referred to letter ballot of the society. The society did not adopt a request, presented by a minority of the committee members which includes all of those representing the electric railway interests, that the specifications should be made to exclude steel for electric motor car axles. The purpose of this simple request was to enable the American Electric Railway Engineering Association to consider the new specifications at the coming convention. The present specifications of the latter association are working out very well and there is no serious objection to them. They are designed to secure for the severe service required of axles on heavy electric motor cars a suitable quality of steel and the result has been satisfactory. When the axles were first manufactured they were quite expensive, but in two years the price has come down to a reasonable figure.

THE A. S. T. M. AND THE A. E. R. E. A.

We regret that more consideration was not shown to the protest of the representatives of the engineering association. The action of the A. S. T. M. in voting to support its committee on technical details is, of course, a natural one. Only a part of the membership is interested at all in a special subject of this kind and must depend upon the experts to determine technical matters. But for the same reason the association, as a whole, might well have heeded a request of duly accredited representatives of another association that it should not attempt to prescribe for the needs of the membership of the latter without its consent. The attitude of the American Electric Railway Engineering Association on this point is clearly set forth in the letter from President J. H. Hanna, published elsewhere in this issue. This association is in the habit of giving careful study before adopting standard specifications. The membership comprises the master mechanics and other engineers of practically every electric railway in the country. Thus, while the association is young its standing is very high. We do not mean to say that there are no merits in the A. S. T. M. specifications. The American Electric Railway Engineering Association might have been willing to adopt them for certain classes of service if there had been a full opportunity to consider them. The real question is a larger one than this, however. It involves the attitude which must be taken by one association toward another if the co-operative spirit is to be fostered. Such actions as the one in question will, we fear, be productive of two results. In the first place, the electric railways will continue to use their own specifications exclusively, and, second, they will be discouraged in their attempt to co-operate with other associations in the preparation of specifications.

THE NEW HAVEN REPORT

The findings of the Interstate Commerce Commission in the case of the New Haven Railroad will surprise no one who read the testimony presented before that body, especially the testimony of Mr. Mellen. The resulting opinion, in its general form, was a foregone conclusion, and few persons will be inclined to disagree with the commission in its condemnation of the mismanagement of the road and of its directors who did not direct. The commission is evidently strongly convinced that anyone who accepts the responsibility of director on a railroad corporation should at least know in a general way what is going on and be convinced of its honesty of purpose, even if he is not sure of its wisdom. With this all will agree. It is another matter, however, to consider that the directors of a company are sureties of its financial success. Poor business judgment is as apt to be exercised by a board of directors as by an individual, and errors of judgment by corporations will be more common if successful men of affairs are discouraged from occupying the office of directors through fear of excessive criticism or suits in case the enterprise is a failure. The most unfortunate phase of the New Haven catastrophe is that the greater part of the punishment for the errors of the past are being visited on the stockholders, who have seen their securities shrink enormously in value. No benefit will be gained by further prosecution of the road or of its present management, which is striving to do its duty to the public. The difficulty with the public is that in a case of this kind it considers the road as an entity. In the case of a bank it is different. If there was a bank defalcation the guilty bank officer would be prosecuted, not the bank which suffered from the loss. It should be so in this case. If there were any lawbreakers they were the former officers, not the present officers nor the stockholders. The latter are the chief sufferers from the evils which have been brought to light, and they should be treated by the authorities with consideration rather than with rigor.

WATER RATE VERSUS EFFICIENCY RATIO

The usual manner of rating a steam prime mover has been to state the steam consumption per hour per kilowatt or horse-power of output. The statement is necessarily always accompanied by specifications of steam pressure, superheat and vacuum. If all machines were rated under the same steam conditions the water rates would be comparable, but even then the comparison would not be fair because all do not produce the best results under the same steam conditions. Even if we grant for the sake of argument that it would be fair to compare water rates at the same pressure, superheat, vacuum and load conditions, it would still require a great deal of mental effort and auxiliary data to estimate the water rate under conditions other than standard ones. It is also very inconvenient to have to append a whole train of specifications to a statement of water rates. To overcome this difficulty the report of the committee on prime movers of the American Institute of Electrical Engineers, abstracted in last week's issue, urges again the use of a simpler and more logical procedure.

If a given quantity of steam is expanded in an engine from the volume which it has at one pressure and temperature to the volume which it will have at another pressure and temperature, it should do a certain amount of work, the theoretical amount depending upon the initial and final states of the steam and upon the amounts of heat taken from or added to the steam during the process of expansion. Assuming the same conditions other than those of initial and final states of the steam, all steam prime movers have the same theoretical water rate. The ratio of the theoretical to the actual water rate under any given set of conditions is then an accurate measure of the efficiency of the machine. The committee very properly urges this "efficiency ratio" as a substitute for the present "water rate."

We believe this to be wise for several reasons. In the first place, the efficiency ratio stands by itself for all practical purposes, being only to a slight extent dependent upon operating conditions; second, its use keeps clearly before the mind the fundamental facts regarding the production of energy in the engine; again, it gives a definite notion of the theoretically avoidable losses in transformation. Elaborating this last point, it should be noted that when the water rate of a turbine, for example, is stated to be 12 lb. per kw-hr. under certain conditions there is nothing here to indicate what it would be were there no friction, no radiation losses and no cylinder condensation. In other words, it does not suggest the water rate of the "perfect" engine under these conditions; "perfect" in this case meaning the engine having none of the above losses. This definition is justified by the classic expresssion "He who does the best his circumstances will allow, does well, acts nobly; angels could do no more." In other words, an engine is perfect if it produces all of the energy represented by the energy difference between the incoming and outgoing steam. The efficiency ratio, or Rankine efficiency as it sometimes is termed, overcomes this difficulty. The fact that water rate alone means little is further illustrated by the famous little engine built and tested many years ago by Messrs. Hall and Treat. This was a quadruple-expansion engine of but a few horse-power but it eclipsed all records for water rate up to that time and its record is creditable even to-day. Obviously there must have been unusual operating conditions to compensate for the proportionately large friction and thermal losses in such a small machine. Examination of the report of tests made upon it shows that there were employed a very high pressure, up to 500 lb. per sq. in., a high degree of superheat, and a very high vacuum.

The efficiency ratio does not render the thermal or thermodynamic efficiency useless. In comparing prime movers of radically different type this ratio of actual rate of energy input to that of energy will always be interesting. It is valuable also in studying, in the case of one prime mover, the effects particularly of changes in pressure and temperature.

KANSAS CITY FRANCHISE SETTLEMENT

The Kansas City ordinance settles one more franchise controversy. The term of the franchise is thirty years. The position of the company is far stronger when it can go to bankers with rights of this duration than when it had to admit that under the old franchise its contract to operate would have expired in 1925. The dangers of expiring franchises almost kill the possibility of borrowing capital at reasonable rates. For several years the company has said that its franchise position prevented it from borrowing money satisfactorily. The removal of this incubus is an incalculable advantage to both company and city. Hampering the company now, it would have hampered it still more as the termination of the franchise grew nearer.

In the recognition of an agreed capital value there is the same principle which is recognized in the equally notable settlements in Chicago and Cleveland, and in a measure in New York. Of the total recognized capital value, one-fourth represents intangible elements. Of the $30,000,000 total value $7,500,000 represents other than physical values. The part of the total in Missouri is roughly $25,600,000, of which $6,300,000 is for intangible items. The latter amount is to be amortized from the income divisible between company and city with the intent that ultimately capital value and value shall be the same. It is distinctly stated in the ordinance that the capital value represents a compromise. It is neither as much as the company wanted to have nor as little as the city wanted to allow. Both parties abandoned a position in the interest of settlement. If the company had held to its position stubbornly it would have obtained in the end less—or more—than this amount. If the city had refused to budge from its position, no matter what eventual price it forced, it would have had to put up in the meantime with a service under the deadly blight of expiring franchises. Both sides are better off with a compromise settlement. The city is not wholly free of all responsibility for present capital value. Evidently, it was not a question with the voters of whether they could legally escape this responsibility, but of whether there was an obligation to give some protection to the reasonable development costs whose advantages they had enjoyed.

Three main purposes of the grant are set forth. That the first of these is "first-class modern service" is wholly in accord with modern theories of regulation. "Subordinate thereto," adds the franchise, the purpose is "to secure for the company its capital value and a 6 per cent. return thereon." After all, these clauses are not remote from the purposes of any company engaged in like business, whether under restrictive or loose ordinances. Service must be given to secure earnings and thereby the integrity of the capital investment. If it is not first-class modern service the company digs its own grave, slowly, it may be, but surely. The third purpose of the grant is the participation of both parties in the income after provision for various deductions which are stated in detail. Subject to its right to secure service of the kind described, the city will not require anything that will impair capital value or the return or materially impair the enjoyment of the rights of participation.

The rights of participation accrue after deductions which, in brief, are as follows: Expenses of management and operation (including maintenance), taxes of all kinds, 6 per cent cumulative for the company on capital value, and liabilities for injuries and damages. The surplus then remaining is to be credited to the city but used by the company for extensions and additions to property until $6,300,000 shall have been so applied, the purpose of this being, as stated, to make capital value and value the same. Thereafter, this surplus shall be divided in the proportion of two-thirds to the city and one-third to the company. The disposition of earnings thus prescribed is noteworthy in several particulars. The allowance in operating expenses for maintenance, repairs, renewals and depreciation is to be at least 16 per cent of the gross of the previous year, which, of course, would make the actual amount realized somewhat under this percentage if the normal increase in business takes place. The rate named, 16 per cent, is specified in Chicago now and it is clearly based on the experience of the lines in that city. Naturally, much comment will be aroused by the fact that the rate of return is fixed at 6 per cent. Whether or not it was intended to give a higher rate of return because of a low allowance for capital value, 6 per cent is surely not more than a reasonable figure for Kansas City. The respect that we have for Kansas City does not go so far as to lead us to say that it can get along as easily without outside capital as with it. Wanting capital, it is better to offer 6 per cent and get it than to hold for a lower rate and fail to get it. The segregation of expenses for injuries and damages from other operating costs and their subordination to the return on capital is past understanding. This is a proper element of operating expense and is commonly so regarded.

The city participation in control is effected through two means, representation on the board of directors and on a board of control. The latter board will have an appointee from the company as well as from the city, and, in the event of differences, a third member. It is evidently an enlargement of the plan underlying the Board of Supervising Engineers, Chicago Traction, but goes farther than the Chicago arrangement in providing not only for supervision of rehabilitation, but also for such control of service as the final interpretation of the ordinance permits. If the ordinance does not assure good service, undoubtedly the appeal to the Public Service Commission of Missouri, which the contract indicates is possible, will take place.

The rate of fare for adult passengers is to be 5 cents, but the city may use its proportion of the distributable profits to reduce fares, although it "shall not so exercise such right as to materially impair or reduce the amount of the company's share below the amount the company would have received if the rate of fare had not been reduced." The construction of this provision appears to involve a determination of the extent, if any, to which a decrease in the rate of fare would stimulate short-haul riding so as to yield enough additional profit to overcome the effect of the reduction. To the extent that the city part of the divisible profits is used for additions or extensions the city acquires an interest in the property. When that interest reaches one-half of the total capital value the city becomes the owner of the property subject to the lien securing the remaining one-half of the capital value. The city also has the right to acquire the property by payment of the entire capital value at any time, but special provisions are inserted to govern the transaction in the event of early purchase. The point is that the city has various rights to purchase under conditions which protect capital value. Another important section gives the city the right to exact forfeiture of the franchise. If the end of the franchise period is reached with the property still in its ownership the company is assured of the integrity of capital value.

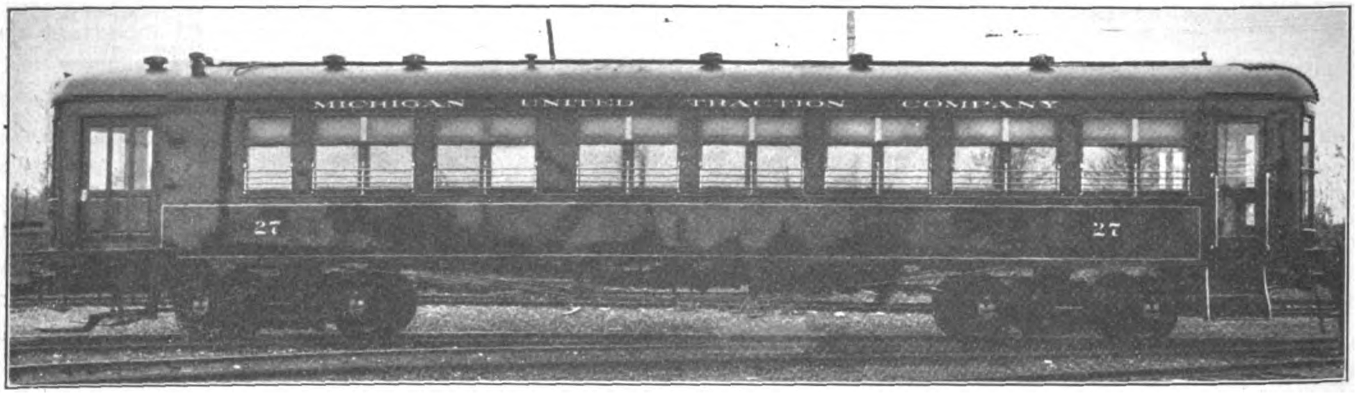
Criticisms of the ordinance will arise from various sources. One such, from Dr. Wilcox, who took part in the fight against adoption of the contract by voters, is published as a communication in this issue. Since nothing done by man is perfect, it may be taken for granted that the ordinance is deficient in some respects from the standpoint of either interest. The real question, however, is, whether or not it was to the interest of both company and public to make a reasonable settlement rather than to continue hostility and retard development of the city. The ordinance gives the city many rights and steps the period of rehabilitation forward from 1925 to 1914, eleven years. Those years will be lived better with the modern service that the city can compel than if they were frittered away in fruitless franchise controversy. The ordinance represents many of the best ideas in settlements, and is a workable contract, promoting, not retarding, progress.

New Steel Cars for the Michigan United Traction

These Cars Are of Especial Interest Because They Are Constructed of Steel and Embody New Features in Structural Design and Arrangement and in Lighting and Ventilating System

Some time ago the executive officials of the Michigan United Traction Company, Jackson, Mich., decided to start a policy of buying all-steel rolling stock for extensions to the existing system as well as for the replacement of worn-out cars. Articles have previously appeared in the ELECTRIC RAILWAY JOURNAL describing the company's city and steel freight cars. The first consignment of steel interurban motor and trailer coaches has just been placed in service on this company's lines between the cities of Jackson, Kalamazoo and Owosso.

One of the considerations leading up to the selection of this type of car was that the company's lines paralleled the Michigan Central, the Grand Trunk and Grand Rapids & Indiana steam railroads. In order to secure its share of passenger business in competition with these steam lines, it was necessary to design a type of car which would be as safe, comfortable and convenient as the best cars used on the lines of the company's steam railroad competitors. It also was necessary to inaugurate an interurban service that was a distinct step in advance of anything heretofore attempted on any electric interurban line.



MICHIGAN ALL-STEEL CAR—SIDE VIEW OF CAR

Another consideration entering into the selection of this type of equipment was the decision to raise the operating voltage from 600 to 1200 d.c. on some of the Michigan United lines. Since interchange agreements were in effect with other interurban roads which required these cars to be operated over 600-volt lines, the electrical equipment had to be such as to provide full speed on either 600 or 1200 volts, and on either trolley or third-rail. To comply with these conditions with multiple-unit operation on both of these voltages required an electric equipment and system of control entirely new in most of its essential details.

When the company had decided on these new all-steel cars and had submitted the designs to the manufacturers for bids, it was found that only a few manufacturers could handle the work, but as the total order was for only ten cars several of these builders refused to bid. The original design included a number of pressings and special shapes which would have materially reduced the total weight of the car body. After the company had had this experience on the first design, another was prepared that could be built by builders of ordinary wooden cars and a wider competition was obtained in this way. In other words, the new design was a concession to prevailing facilities and available steel-working tools in a great many of the shops in the country and contained only the standard structural shapes which could be purchased in the open market.

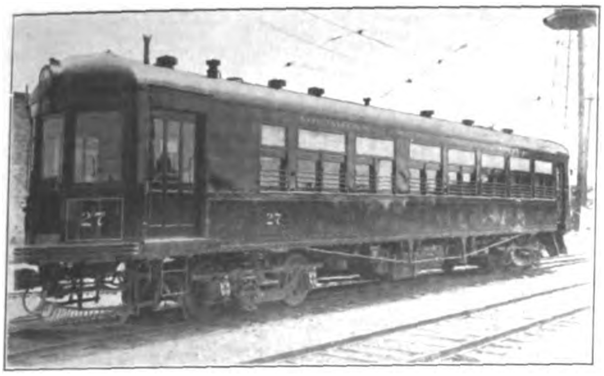
ESSENTIAL CONSTRUCTION DETAILS

The principal dimensions of these new all-steel cars are as follows:

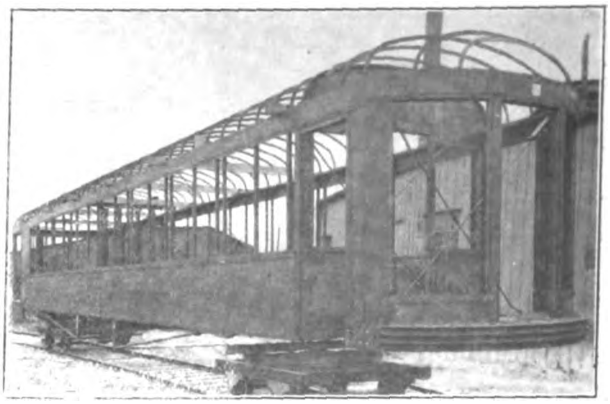
Length over bumpers	61 ft.
Length over vestibules	59 ft.
Length of passenger compartment	29 ft.
Length of smoking compartment	11 ft. 6 in.
Length of baggage compartment	9 ft. 4 in.
Length of rear vestibule	4 ft. 6 in.
Width over sheathing	8 ft. 9 in.
Width over belt rail	8 ft. 11 in.
Width inside at seat line	8 ft. 2 in.
Height from rail to top of roof	12 ft. 1⅝ in.
Height from lower sill to roof	9 ft. 4⅝ in.
Center to center of body bolsters	36 ft.
Length of seats	3 ft. 2 in.
Center to center of seats	2 ft. 10 in.
Width of aisle	1 ft. 10 in.
Seating capacity	56

As mentioned heretofore, the underframe is made up of structural shapes, the center sills being 8-in. 18-lb. I-beams extending from buffer to buffer. The two side sills are formed of 8-in. 13¾-lb. channels extending from the rear bulkhead to the front buffer, and the two intermediate sills are 6-in. 10½-lb. channels. The body bolsters are formed of two 6-in. 10½-lb. steel channels with top and bottom cover plates ¾ in. x 12 in. These are securely riveted together and to the longitudinal side sills. Cross-braces supporting the floor are formed of 5-in. 6½-lb. channels. The bumper irons are 8-in. 13¾-lb. channels riveted to the side members, center and intermediate sills, to which Hedley heavy-section anti-climbers are fastened. Each side sill has an under truss rod extending from bolster to bolster which supports 16-in. queen posts fitted over 8-in. needle beams 8 ft. center to center.

The car-body framing is of the side-girder type with ⅛-in. x 36-in. side sheathing securely riveted to the side sills and reinforced at the belt rail with a ⅜-in. x 2½-in. plate, which is continuous from end post to end post. The sides are framed for seven double windows and one single window on each side, with a baggage door opening 42 in. in width situated at the front vestibule, a location which reduced the structural problem at this point to insignificance. All single posts and composite posts are built on 2-in. x 2-in. x ¼-in. tee-section main members, arranged with a steel covering, as shown in the accompanying illustrations. These posts are designed for double sashes, the lower ones raising inside the Gothic upper sashes and behind the pressed-steel curtain boxes. The posts are securely



MICHIGAN ALL-STEEL CAR—VIEW FROM FRONT END

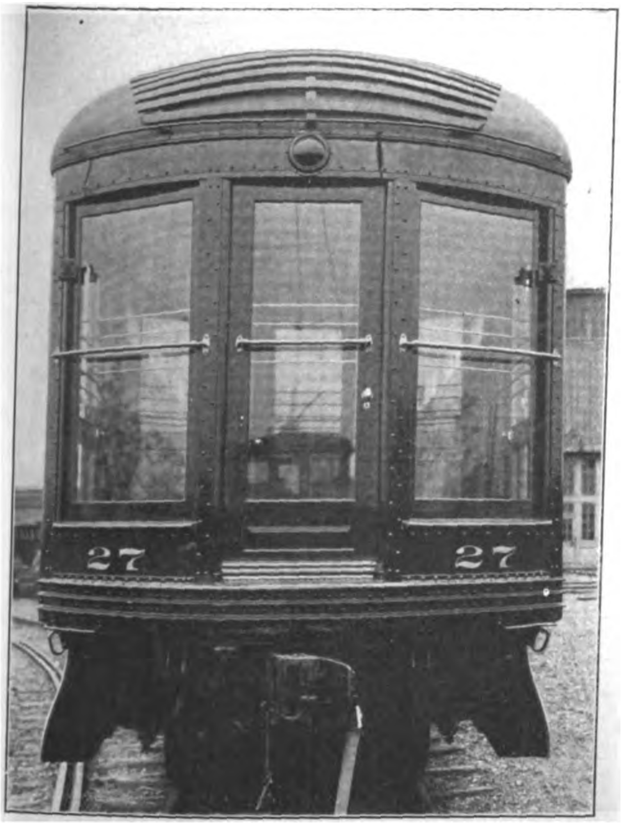


MICHIGAN ALL-STEEL CAR—VIEW FROM FRONT END AND STEEL BODY BEFORE RIVETING WAS COMPLETED

riveted to the side sills, side plates and top plates. The corner and door posts were designed specially for their respective locations, and they are strongly braced to the underframe to resist unusual impact.

In order to provide maximum value in girder strength the side plates are made continuous from end post to end post, with a single splice at the center. The letter plate is continuous around the entire car, and the inside facia board is continuous the full length of each side. The inside lining below the window sill is 3/16 in. agasote, and the space between it and the outside sheathing is thoroughly packed with Flaxlinum, a fire-resisting, insulating compound.

The partitions between the baggage room and the smoking compartment are provided with double walls of 3/32-in. sheet steel, with reinforcing members at the doors. These partitions are anchored to the floor by a 3-in. channel. The space between the two partition walls is packed with the insulating material. The partitions between the toilet compartment and the smoking and passenger compartments are of single thickness, being 3/32-in. sheet steel. These partitions are lined on the passenger side with sheet brass to a distance of 30 in. above the floor line. A double wall rear bulkhead is also used, with a window on each side of the sliding door opening between the passenger compartment and the vestibule.



MICHIGAN ALL-STEEL CAR—END VIEW OF CAR

The roof is of plain arched type formed with the 2-in. x 2-in. x ¼-in. tee carlins and posts, which are continuous from side sill to side sill. Additional roof support between the continuous posts and carlins is supplied by intermediate ½-in. steel carlins securely riveted to the top plates. Ash nailing strips are bolted to these intermediate carlins, and two longitudinal rafters of ash serve as spacers. Both the ¼-in. roof sheathing and the 3/16-in. headlining are formed of agasote sheets securely screwed to the roof carlins. The roof sheathing is covered with a No. 8 duck in one piece and thoroughly saturated with white lead before being laid. Surmounting this covering is a roof board extending the full length of the car and stringers properly insulated to receive the trolley base.

GENERAL ARRANGEMENT

As is shown in the tabulation of over-all dimensions of these new all-steel cars, the body is divided into three compartments, namely, a combination motorman's cab and baggage compartment, a smoker, and a passenger compartment. The total seating capacity is for fifty-six passengers, there being eighteen cross-seats and two longitudinal seats in the passenger compartment, and eight cross-seats in the smoking compartment. These two compartments are separated by a corridor, 3 ft. 5 in. in length, with swinging doors fitted with door checks at each end. This arrangement serves to

prevent smoke from passing back into the passenger compartment and also as an entry way to the two toilets. On each side of this corridor are two sanitary drinking fountains arranged to fold into pockets in the wall. The water is automatically turned on when a fountain is pulled from its pocket.

The rear platform is unique in that it is arranged as a fully-inclosed, unobstructed observation compartment. As shown in the rear view of this car, the glazed areas in the two vestibule windows and end center door extend from the letter board to within 14 in. of the vestibule door level. The trap doors over the rear vestibule steps are of the O. M. Edwards balanced type, locked in both the vertical and the horizontal positions. On the under side of these doors there are riveted diagonal grab handles to aid passengers in boarding the car. The steps have steel risers and treads, the latter being entirely covered by Mason safety treads, and the sides of the well are covered with polished brass edging. The first step is 14 in. above the rail, and all other steps have 12-in. risers, with 8-in. treads, thus giving easy access to the car.

A feature in connection with the seats used and their arrangement is that all are stationary, this being possible because the car is operated single-end. The seats are not like the usual stationary seat with the straight back, but have high backs with head rolls and spring edged cushions like the Hale & Kilburn Walkover type, and consequently they are just as comfortable. Generally, when stationary seats are used, those facing the bulkheads between compartments are undesirable because of the limited space for the passengers' feet. To meet this objection foot pockets were placed in each partition immediately in front of each stationary end seat. This makes these seats as comfortable and desirable as those in any other part of the car. These pockets are formed of sheet metal and extend into the baggage compartment and toilet compartment and are in spaces which would not otherwise be utilized. Another feature in the construction of this car is the over-all thickness of the car sides, which is only 2 9/16 in. This made the available width at the seated passengers' waist line 8 ft. 4⅛ in., and by utilizing the 2½-in. recess outside the window stool line extra seat width was provided.

All interior finish in the smoking and passenger compartments is mahogany or imitation mahogany, except the ceiling, which is a light color to give reflective effect to the lighting scheme. The doors, sashes and window stools are finished in the natural mahogany, and the exposed steel and inside lining below the window stools are finished in imitation mahogany. The baggage compartment is finished in imitation oak, the toilet rooms in white enamel and the rear platform in the same color as the car body, which is a dark olive green. A composition flooring known as Flexolith, 1 in. in thickness, is laid with a smooth polished finish over Chanarch floor plates with corrugations ½ in. deep. This composition floor is used in the smoking and passenger sections and it has ogee curves in all corners to facilitate cleaning. The baggage room floor is formed of 1¾-in. matched hard maple with 1-in. half-oval iron strips opposite the doors, so as to withstand the rough usage incident to a baggage compartment. Beneath all these floors is a false floor also of corrugated sheets riveted to the lower side of the underframe, and the space between these two floors is thoroughly packed with mineral wool.

HEATING AND VENTILATING SYSTEM

As mentioned heretofore the baggage compartment is 9 ft. 4 in. over all in length and is arranged to serve also as a motorman's cab and for the hot-water heater installation. The latter was especially designed by the Peter Smith Heater Company and is one of the features of the design of the car. The heater system has a double circulating system from a central tank located in the baggage room at the transverse center of the car body. With this arrangement hot water to each side of the car circulates through separate coil systems of four rows of 1½-in. pipes installed on each side of the car. In this system the hot water must travel but half as far as in former designs. It therefore returns to the coils in the heater twice as often. It is believed that this change will increase both the efficiency and the economy of the heating system. As these cars are for use in a cold climate, they were built with double windows, walls, ceiling and floors.

Owing to the use of the plain arch roof, it was believed that the cars would be difficult to ventilate in winter without artificial ventilation, and a system using air under pressure was installed. This consists of a direct connected electric motor with a Sirrocco blower in a housing swung from the baggage-room roof carlins. This blower takes fresh air from the roof and forces it into a duct which branches just back of the fan. From this point two ducts pass along the partition between the baggage compartment and smoker to

the floor line, where they connect with ducts installed behind the heater pipes extending the full length of the car. Outlets under each seat permit the fresh air to be forced over the heater pipes into the car, from which it is removed by twelve 8-in. Globe ventilators. The capacity of the motor-driven fan is 500 cu. ft. per minute, which is sufficient to deliver fresh, warm air below the breathing zone at an outlet pressure of 2 ounces. By this system of heating and ventilating, it is believed that all compartments will have a sufficient supply of pure air to make riding in winter as pleasant as in summer. In addition to the ventilating system described, the smoking and passenger compartments are fitted with 12-in. circulating wall fans for summer use.

LIGHTING SYSTEM

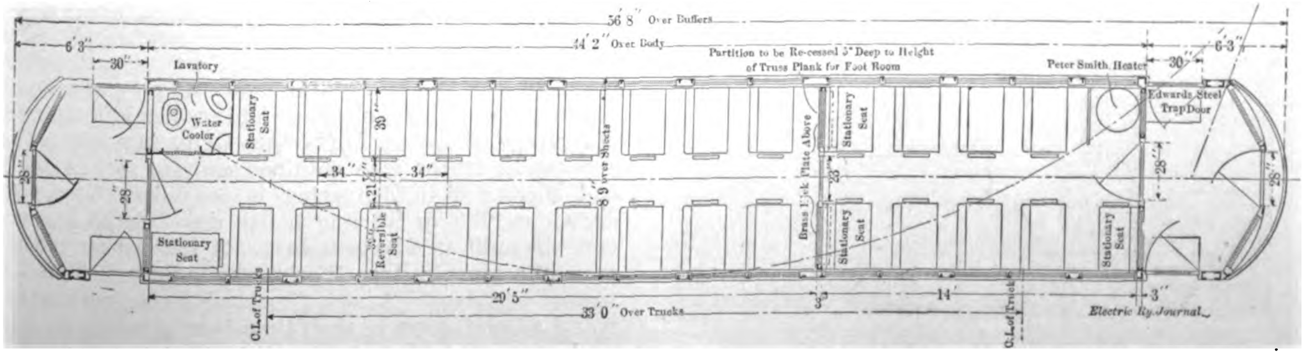
It has been recognized by progressive railway managers, as well as by the riding public, that the lighting of interurban coaches in the past has been far from satisfactory on account of the fluctuations of the line voltage. In the case of third-rail systems another cause of trouble occurs because of the breaks in the third-rail at road crossings. In this particular case these two factors were complicated by the fact that the cars were to be operated at two different potentials, namely, 600 and 1200 volts. Nevertheless, the lighting of these cars has been quite successfully accomplished by the use of twenty-five cells of Edison A-8-H storage batteries and without the use of any complicated regulating devices. The batteries are mounted under the car, and during the lighting period discharge direct into the lighting circuits at 30 volts. The batteries are charged by a 3-kw GE motor-generator set, also mounted underneath the car. This motor generator operates direct on 600 volts and when the car is on 1200 volts derives its current from a dynamotor. According to the present plan the batteries will be charged during the day, at normal rate, which requires seven hours. If the battery should fail, energy may be derived direct from the motor-generator set.

This system of lighting was selected because of its reliability, simplicity and flexibility. As the cars may be laid up over night at any siding on the system, it was deemed advisable to install independent units, in preference to using a central charging station which would require the handling of the batteries daily. In a test run made with this lighting unit, the improved voltage regulation was clearly demonstrated. As shown on the accompanying chart in one of the illustrations, an average drop of but 5 volts at the motor-generator set was recorded when the average line drop was more than 150 volts. This indicates a sufficient voltage regulation to insure uniform illumination at all times. Another reason for this rather complicated arrangement was not only to obtain a lighting system sufficiently perfect for all practical purposes and to bridge over the third-rail gaps which heretofore have interrupted the energy supply to the lighting circuit, but to provide light when current is off the line.

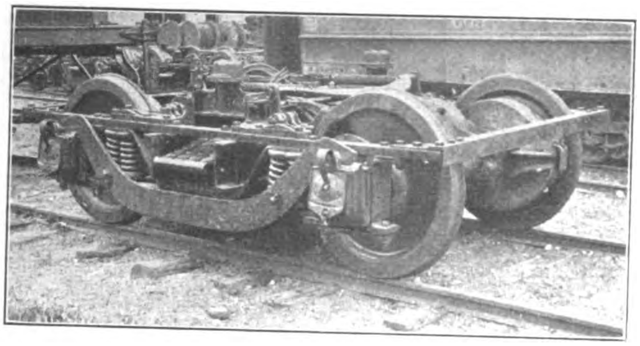
As to the lighting system proper, all circuits are installed in pipe conduit, and the fixtures include deep opalescent shades set in special lock sockets and shade fastenings. The lamps are 25-watt, 30-volt Mazda, and are arranged one over each of the twenty-eight seats. An actual test of this entire lighting system indicates that each car will be perfectly lighted with a total current consumption of 644 watts. Another feature in connection with the lighting system is that the tail light is connected in the battery circuit. This light is installed in conjunction with the usual oil tail lamps. Both this tail light and the headlight are set in recesses under the front and rear hoods of the car body, so that the lenses are flush with the car front and rear. The headlight is made adjustable, so that its rays may be readily thrown at any angle along the track.

TRUCK DETAILS

Other features worthy of mention include the manner of installing the end connections. These include two control circuits and a bus circuit, all of which are brought down to the pivotal points on the drawbars. From this point they are carried forward in steel pipe conduit to the drawbar carrier castings, and, of course, follow the drawbar in rounding curves. This type of connection is shown in one of the illustrations. It not only permits the use of a short jumper connection, but the drawbar curve limits, only, are the end connection limits. Other electrical equipment includes Westinghouse 333-B-2, 115-hp, interpole motors with H.L. control. These are so arranged that the motors will operate at full speed on either 600 or 1200 volts and also provide for multiple-unit operation of all switches for both trolley and third-rail. All wiring and connections throughout the entire car for every purpose are laid in conduit with special fittings, and junction boxes



MICHIGAN ALL-STEEL CAR—FLOOR PLAN OF 56-FT. 8-IN. STEEL TRAILER



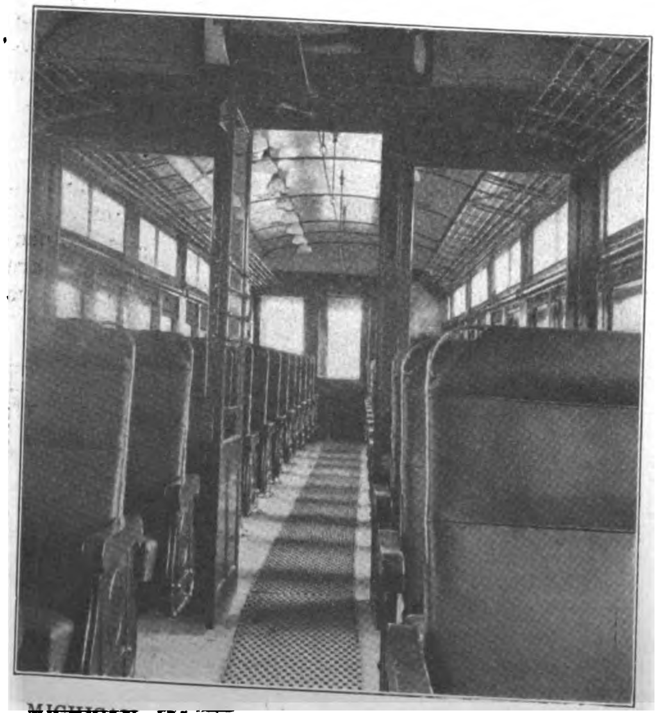
MICHIGAN ALL-STEEL CAR—SPECIAL TRUCKS

are used whenever it would add to the safety of the installation.

Especially designed trucks with an 87-in. wheelbase which permits the use of quadruple elliptic springs were purchased for these cars from the Baldwin Locomotive Works. The long wheelbase and the spring arrangement were employed to obtain an easy riding truck. A double set of machine coil springs is mounted in the truck to prevent its nosing longitudinally. The trucks are also equipped with Symington ball-bearing center bearings and double Perry roller, roller side bearings.

TRAIL CAR FEATURES

Of this order for ten all-steel cars, four were trail cars. These are of the same general appearance and design as the motor cars but were arranged for double-end operation, consequently they have vestibules at both ends. Each has two compartments, a smoker and a passenger. There are nineteen reversible cross-seats upholstered in green plush in the passenger compartment, and eight cross-seats and one longitudinal seat upholstered in black leather in the smoker. The partition between the two is provided with wide glass areas, the lower edge of the frames being well below the tops of the seat backs, to give the effect of a single compartment body. Heating and ventilation are the same as in the motor cars, but the lighting system is supplied from the trolley direct on 600-volt or from the dynamotor on 1200-volt lines. Exterior and interior views of this car are shown in the accompanying illustrations.



MICHIGAN ALL-STEEL CAR—INTERIOR OF TRAIL CAR

GENERAL DATA

The following are the principal dimensions of these new all-steel trail cars:

Length over bumpers	56 ft. 8 in.
Length over vestibules	44 ft. 2 in.
Length of passenger compartment	29 ft. 5 in.
Length of smoking compartment	14 ft.
Length of vestibules	6 ft. 3 in.
Width over posts	8 ft. 8¾ in.
Width over sheathing	8 ft. 9 in.
Length of seats	39 in.
Width of aisle	21⅞ in.
Seating capacity	56

These new cars were designed by R. C. Taylor, superintendent of equipment of the Michigan United Traction Company, under the direction of J. F. Collins, vice-president and general manager, and were built by the St. Louis Car Company, St. Louis, Mo. To give an idea of how the total weight of this car, namely, 52.8 tons, is distributed, the following table is presented:

Weight of body	51,200 lb.
Weight of motors	17,320 lb.
Weight of air brakes	2,500 lb.
Weight of trucks	26,500 lb.
Weight of electrical equipment	5,525 lb.
Weight of lighting set	2,600 lb.
Total weight	105,645 lb.

Restoring Service Quickly After Boiler Explosion in Meridian, Miss.

A remarkable example of what can be accomplished by the good public relations of an electric railway is furnished by the recent emergency repair work performed following a boiler house explosion by the co-operation of citizens, city authorities and outside engineers with the officials of the Meridian Light & Railway Company, Meridian, Miss., a subsidiary of H. L. Doherty & Company. This accident was briefly described in the news department of the ELECTRIC RAILWAY JOURNAL of June 27. A defective boiler head caused the boiler to be blown through the brick wall of the power house and to land some distance outside after having turned a complete somersault.

The first emergency work consisted in clearing away the wreckage caused by the destruction of the side wall and roof of the power house. The demand for extra men for this repair work met with quick and generous response. The New Orleans & Northeastern Railroad at once turned over its extra gang of about forty men to General Manager A. B. Paterson and the city authorities set the city prisoners to work on the task of removing the debris.

So fast was the work of repairing the power house apparatus expedited, despite a period of record breaking hot weather, that within two and one-half days after the explosion occurred it was possible with the aid of the sole surviving boiler to generate a power output of 1400 kw, sufficient to resume the city lighting service and to operate the usual number of street cars at half schedule. Full street car service was dependent on installing new boiler equipment. The Babcock & Wilcox Company made an unusually quick shipment of a 500-hp Stirling boiler which was on order at the time of the explosion. This boiler left the manufacturers' shops at Barberton, Ohio, accompanied by a personal tracer who obtained express service for it and succeeded in delivering it four days later. An additional 750-hp Stirling boiler was ordered and was entirely built in fourteen days. A new stoker ordered from the Murphy Iron Works was built and shipped in twenty-one days. A new Crocker-Wheeler commutator was also sent down in rush time from Ampere, N. J., to replace one which had been injured by bricks.

Kansas City Railways Franchise Ordinance

Abstract of Ordinance Recently Approved by Voters of Kansas City, Mo.—Among the Features Shown Are a Partnership Method of Control, a Valuation of the Physical and Intangible Property of the Company, a 6 Per Cent Rate of Return, a Plan for Division of Excess Earnings with the City, and a Recapture Clause

The new franchise ordinance approved by the voters of Kansas City, Mo., on July 7 grants rights to the Kansas City Railways, a new company organized for the purpose of acquiring the property of the Metropolitan Street Railway, the Central Electric Railway and the Kansas City & Westport Belt Railway. The preamble says in part that the city desires to fix and define the terms and conditions upon which the company shall operate its lines and the method by which the city shall have the right to participate in the management, operation and control and in the earnings of the property in Missouri and, if it shall so elect, to take over and operate the property.

INTENT OF ORDINANCE

The intent of the ordinance is to grant the right to own and operate lines upon the surface of streets specified. Where any parts of the existing lines are now operated upon a street or upon an elevated structure over a street they shall continue to be so operated unless changed with the consent of the city. The ordinance shall not be so construed as to grant the right to own, maintain or operate a subway or elevated line. No right granted by the ordinance shall vest unless within fifteen days after its passage and approval the company shall accept all of the provisions, and the United States District Court which has been administering the receivership shall recommend that the ordinance be fully carried out, and there shall be deposited with the comptroller a sum sufficient in his judgment to defray expenses of the election.

The obligation of the company to the city created by this ordinance shall be the first and paramount obligation of the company prior and superior to any other obligation, lien or right upon or against any of its property or earnings. At the time of acceptance of the contract there shall be filed with and approved by the city comptroller the bond of the Kansas City Railway & Light Company that the grantee will acquire the title to the properties, and if it defaults in the obligation the city shall receive $100,000. All rights, franchises and authority granted to the company shall cease thirty years from the date the ordinance is adopted by the people unless terminated sooner in accordance with its provisions. Both parties agree that the first and primary purpose of the contract is to secure for the public first-class modern service, and after that purpose is accomplished and subordinate thereto, second, to secure for the company its capital value and a 6 per cent return thereon, and, third, to enjoy the participation outlined for both parties to the contract. The city agrees that, subject to its right to secure such service, it will not require the company to do anything that will impair the capital value or return thereon or materially impair the enjoyment of the rights of participation in accordance with the contract.

BOARD OF DIRECTORS

In no event shall the aggregate amount of outstanding mortgage indebtedness and capital stock be in excess at any time of the value of the property of the company wherever situated, exclusive of franchise value under this ordinance. The company shall deliver to the city such shares of stock as are necessary to qualify the persons designated by the city as its representatives on the board of directors. Of the eleven directors Kansas City, Mo., shall select five. No person so designated shall be eligible to serve if he owns or controls any stock (except qualifying shares) or bonds or has any contract directly or indirectly with the company for materials or supplies or for labor or has any financial motive in relation to the business of the company. If any such person shall be disqualified for any such cause, his right to the office shall cease. In the selection of such directors political affiliation shall be disregarded. The directors shall not delegate power to any executive or managing committee without the unanimous consent of the city's directors. The five directors for the city are designated in the ordinance. They are: William T. Kemper, John H. Wiles, Davis M. Pinkerton, Frank C. Niles and John W. Wagner. They serve respectively for different periods from five years to one year in length. It shall be the duty of the company to cause such persons and their successors to be elected promptly as directors of the company. The future directors are to be selected as follows: The Mayor shall submit to the Kansas City Court of Appeals a list of three names for every city director to be chosen and the court shall select the names to be certified to the company. The judges shall have the right to reject all names. The Mayor shall then continue to submit lists until a selection is made. The city shall have the right by agreement with Kansas City, Kan., to give to that city the right to name as its representatives on the board of directors not more than two of the five city directors. The city is to have the right to examine the books.

BOARD OF CONTROL

The company shall appoint a board of control consisting of P. J. Kealy, designated by the company, and Robert P. Woods, designated by the city. Any difference between the two shall be summarily determined by a third person as arbiter to be selected by a majority of the judges of the Kansas City Court of Appeals. The third person shall be disinterested and qualified by study and experience to pass upon the questions. The company may remove its representative and appoint a successor. The city's directors or a majority of them with concurrence of the Mayor may remove the city's representative on the board of control and designate a successor. Either the city or the company shall have the right to apply to any court of competent jurisdiction for the removal of either member of the board of control for fraud, corruption or failure to perform his duties in good faith.

The board of control shall have the right to employ such assistants as are necessary for the performance of its duties. The salaries and compensation of members and of assistants and necessary expenses and outlays shall be paid by the company. The board is charged with the following duties: to supervise and direct the routing, stopping and schedules of cars in accordance with ordinances of the city and orders of the Public Service Commission of Missouri; to require to be maintained upon the lines at all times sufficient, good and convenient cars and equipment to accommodate public travel and provide first-class service; to designate and approve the kind, character and amount of construction, reconstruction, equipment, re-equipment and additions; to approve the kind of rails, poles, wires and materials to be used and to supervise and approve all work in relation thereto and ascertain and certify the cost thereof; to determine and certify to the city and the company what expenditures shall be charged to capital account and to classify properly and charge all other expenditures of the company; to determine the system of accounts and supervise the keeping thereof; to inspect and audit all receipts, disbursements, vouchers, prices, payrolls, time cards, papers, books, documents and property, and to prepare and file semi-annually with the president of the company and the city comptroller a statement of all receipts and disbursements and of the condition of the capital and other accounts and generally of all transactions and work done as well as work proposed to be done, together with such recommendations as they shall deem proper to make; and finally to do everything necessary for the efficient performance of their duties. Wherever in the ordinance any duty is imposed upon the board of control it is at the same time made the duty of the company, the board being for all these purposes the agent of the company.

FARES, TRANSFERS AND CARS

Unless fares are reduced as approved in the ordinance the company shall carry a passenger for a single fare of 5 cents over its entire system within the city. For passengers between eight and twelve years of age the fare shall be 2½ cents. The company shall furnish conductors with tickets to be sold for the use of passengers between eight and twelve years of age at the rate of two for 5 cents. No passes of any kind shall be issued to any person. Employees of the company, policemen and firemen shall be permitted to ride free, subject to rules and regulations of the board of control. Universal transfers shall be granted over all parts of the system in the city. Such transfers shall also be granted over all parts of the system in Kansas as the same now exists or may be extended within the limits of Rosedale and Kansas City, Kan., and intermediate points, as long as the company shall be interested in, operate or have traffic arrangements with the companies owning the lines in Kansas, and also as long as any of the cars of either the Missouri or the Kansas lines shall operate over any of the tracks of the other company.

The company shall make no traffic or transfer arrangements with any companies operating lines hereafter built in Rosedale or Kansas City, Kan., unless such company shall give like traffic or transfer privileges over their lines, although at no time shall the rights of the parties to the ordinance be substantially impaired by the granting of intercity transfers. The city shall have the right by ordinance to discontinue, regulate and control intercity transfers in any manner that will not reduce the return of the company on its capital value. The transfer provisions shall not be construed so as to enable passengers to return substantially to the initial point for a single fare.

All cars operated hereafter shall be of the best quality, style, finish and design and shall be approved by the board of control. The equipment as a whole shall at all times be equal to cars in ordinary use on the best managed and equipped lines of the street railways in the United States. The board of control or the city shall divide the city into speed zones. All cars shall be in charge of not less than two competent men, except where otherwise ordered by the board of control. The company shall furnish "owl-car" service.

REHABILITATION

As soon as the Twelfth Street viaduct, now under construction, is completed the company shall electrify all parts of the system not then electrified. It shall expend for this purpose $1,500,000, or so much thereof as may be necessary. In each year for three years following the adoption of the contract not less than twenty-five additional new cars shall be purchased and put in service. During each of these three years the company shall construct in specified locations not less than 5 miles of single track, or during the full period 7½ miles of double new track. The city shall retain the title to certain tracks to be constructed across the Union Station plaza. The city shall pay the cost to the company. In addition to expenditures for extensions as provided during the first three years of the contract, $250,000 shall be provided at once for such other and further extensions as may be determined upon by the board of control. The city, if and when it acquires the power so to do, or any number of inhabitants, under authority from the city, may build under the supervision of the city engineer extensions to the company's lines or entirely new lines within the city to be operated as part of the system upon such terms and conditions as the board of control shall prescribe.

FUTURE EXTENSIONS

After three years the city shall have the right by ordinance to require the company to construct and operate such extensions as a majority of the city directors may recommend and the city by ordinance require, unless manifestly unnecessary for the convenience of its inhabitants. The burden shall always rest upon the company to prove that the extension so required is manifestly unnecessary. The aggregate of such extension shall not exceed on the average 4 miles of single or 2 miles of double track in any one year. There shall also be such additional extensions of single or double track as shall be reasonably necessary for the convenience of the inhabitants, and, as the board of control shall declare, will if constructed produce an income on the investment of not less than 6 per cent over the expenses of operation and maintenance. Any single track extension shall be reconstructed and operated as a double track as soon as such double track is necessary and will produce the income specified.

The city shall have the right if it constructs or acquires any viaduct within its limits or in connection with cities in Kansas to compel the company to operate cars thereover and to pay therefor reasonable compensation whenever reasonably necessary to accommodate public travel. The board of control shall determine when such operation is necessary to the companies.

JOINT USE OF TRACKS

The city reserves the right to authorize one or more street railways to operate cars on the tracks and to use the poles, wires, appliances, power and electric currents for six consecutive blocks or less. The city also reserves the right to authorize any company to use certain loops. The using companies under these circumstances shall pay reasonable compensation, the amount of which shall be determined by the board of control with the right of judicial review.

INTERURBAN LINES

All connections with any existing interurban line shall be continued as they were on Jan. 1, 1914, unless the city by reasonable ordinance and after six months' notice shall require connection at another point. All connections made hereafter between any interurban line and tracks of the company shall be made at the expense of the former under the supervision of the board of control at the city limits or at such place within the city as the city may authorize by ordinance. All connections shall be maintained by the company at the expense of the interurban company. The city reserves the right at all times to revoke the right of any interurban company to operate its cars or have the company operate them within the corporate limits of the city in the event that such interurban company shall fail to pay promptly any final judgment rendered against it under the provisions of the ordinance, or shall fail to comply within a reasonable time with any reasonable order of the board of control or any lawful ordinance passed hereafter by the city. All interurban cars within the city may continue to be used until the board of control shall order the use thereof discontinued for the reason that the cars are not fit or suitable for such use. In such event the displaced cars shall be replaced with other cars. Interurban cars shall be operated within the city by crews of the city company. Interurban passengers on cars received by the company shall pay the company the same fare and shall be entitled to the same transfer privileges as if they had taken regular passage on city cars. The company shall pay to each existing interurban line for the use of interurban cars while on the tracks of the company 15 per cent of the amount received from each passenger who is on such interurban car when delivered to the company and from each passenger who is on the cars when redelivered to the interurban line at the point of connection unless the company and the interurban line with the approval of the board of control and consent of the city shall agree upon some other amount. The board of control may determine when and where interurban cars may be stopped for passengers and whether or not they shall stop for local passengers.

FREIGHT AND EXPRESS TRAFFIC

Interurban cars carrying market vegetables and the products of market gardens shall be conveyed by the company as near the public markets as the tracks of the company permit. Interurban cars carrying through express and freight shall be carried to and from stations. The hours during which such freight and express cars shall be operated shall be subject to regulation by the board of control and by the city. The compensation for the transportation of such cars shall be determined by the board of control with the approval of the city's directors. The city reserves the right to regulate and prohibit the carrying of freight and express and the operation of freight and express cars within the city limits. The city may construct or authorize others to construct a central passenger station for interurban passengers, baggage, express and United States mail. For the use of the central station each interurban line shall pay to the owner of the station the 15 per cent paid to it by the company for each passenger received or delivered at the point of connection. The company shall pay to the owner of the station an additional sum not exceeding 5 per cent of the fare paid by the interurban passengers. It is agreed that interurban traffic to and within the city shall be encouraged to the fullest practicable degree.

The company under the supervision of the board of control may carry United States mail and also light packages or parcels besides those in possession of passengers, but not in such manner as to interfere with the convenience and safety of passengers or with passenger traffic. The city reserves the right to regulate and prohibit the carrying of packages on cars within the city limits. All charges for such services shall be compensatory, uniform and reasonable.

MOTIVE POWER AND PAVING

The motive power shall be electricity applied by the overhead trolley system. The city shall have the right at any time after three years from the date of adoption of the ordinance to require any portion in congested business districts to be operated by the underground conduit system. It is provided that the city shall exercise its power in this regard in reasonable manner and shall not require at any one time an excessive investment of money for such purpose.

The company, under the supervision of the board of control, shall pave and keep in good condition and repair the streets between its tracks and between the rails thereof and for 18 in. beyond each outer rail, and shall repave the same when necessary. It shall perform a like obligation under direction of the board of park commissioners where its tracks are laid in any boulevard paved for its entire width. Obligations as to grading are also included in the ordinance. Other sections relate to the location of tracks in the center of the street, the abandonment of tracks in any street, and street cleaning and sprinkling.

CAPITAL VALUE OF PROPERTY

The capital value of all the property of the company in Missouri is fixed at $25,648,806. To this value shall be added the cost of all additional extensions and betterments, including bridges and rights over viaducts and through subways made after May 31, 1913, properly chargeable to capital account. The value of the property as specified is arrived at by taking into consideration the value of all existing property in Missouri on May 31, 1913, with the value of its earnings for the fixed period of the existing contracts with the city, as well as the total of moneys actually expended from time to time in the building up of the properties. The amount stipulated is a compromise between the company and the city of their respective calculations concerning property values. If the value of the properties as fixed be the subject of investigation or inquiry by any person or authorized tribunal, the company shall always have the right to assert and prove all matters and things in support of such values as fully as its predecessors might have done on May 31, 1913, provided that nothing shall be so construed that the value stipulated shall be increased. The company agrees to procure such new money as, together with such portions of the surplus as may be used by the ordinance to pay for extensions and additions to property in Missouri, will provide the following sums for additions and betterments: 1914 to 1918 inclusive, $650,000 per annum; 1919 to 1923, $725,000 per annum; 1924 to 1928, $775,000 per annum; 1929 to 1933, $825,000 per annum; 1934 to 1938, $875,000 per annum, and 1939 to 1943, $925,000 per annum. The new money shall become a part of the capital value. It is agreed that if the net earnings in the aggregate exceed or are less than 35 per cent of the gross receipts in any year the amount to be expended annually shall be increased or diminished correspondingly.

SUPERVISION OF EXTENSIONS

All extensions and additions shall be constructed or acquired by the company under the supervision of the board of control. In the replacement of any cars or any other property there shall be charged to capital account the excess amount that the new property costs over the original cost of the property displaced. There have been filed in the office of the city clerk the inventory of Bion J. Arnold and also the inventory by L. R. Ash, as of May 31, 1912, in which the engineers do not agree as to depreciated physical value, exclusive of other elements of value, of certain property. There has also been filed in the clerk's office a reconcilement of the values of P. J. Kealy and L. R. Ash, wherein it is agreed that such depreciated value of property in Missouri and Kansas was $22,500,000. The agreed apportionment thereof between Missouri and Kansas is in the ratio of 84 per cent and 16 per cent respectively, thereby fixing the depreciated value of the property in Missouri, exclusive of other elements of value, at $18,900,000. There has also been compiled a statement dated Sept. 6, 1913, by Mr. Kealy and Mr. Ash showing that between May 31, 1912, and May 31, 1913, the receivers added to property value in Missouri $600,000. It is the duty of the board of control to adjust these appraisal inventories before ninety days after the adoption of the ordinance so as not to increase or decrease the totals of the valuations as stated in the ordinance. It is agreed that when and as the physical property contained in the board of control's adjusted principal inventory is renewed or replaced the difference between the cost of renewal or replacement and the value of the property renewed or replaced shall be added to or deducted from capital value as such cost is greater or less than the value so fixed, unless paid for out of the surplus credited to the city or out of the city's share of the surplus.

DISPOSITION OF EARNINGS

Out of the gross earnings each year there shall be paid: (1) All expenses of management and operation, including all expenditures necessary to maintain the property in first-class condition and provide first-class modern street car service, and all taxes, license fees or public charges and special assessments, including all public charges upon earnings or income. (2) To the company, 6 per cent per annum cumulative, payable semi-annually, upon the capital value. (3) All liabilities for injuries and damages, including claims to the city up to the time of the adoption of the contract, whether these accrued before, during or after the receivership, shall be paid as a special operating expense, subordinate only to the payments stated in 1 and 2 and prior to participation by the city or company. (4) The remainder of the earnings shall be credited to the city from time to time and shall be used by the company to pay for extensions and additions to the property until $6,300,000 is so used. Such credits to the city shall be made upon the books of the company and evidenced by certificates delivered to the city comptroller to the effect that the city is the owner of an equitable interest in the property of the company to the extent of the amount of surplus so used (stating the total amount thereof to date) subject to the company's right to capital value, the return thereon and participation as defined in the ordinance. No part of the same and no part of the value of any extensions or additions acquired by the use thereof shall be added to or become a part of capital value or be considered in payment of reduction thereof. (5) When the $6,300,000 surplus income shall have been used, then and thereafter the surplus income shall be paid two-thirds to the city and one-third to the company. The two-thirds belonging to the city shall be credited to it upon the books of the company and until the city ordains that the total or any part shall be used for other purposes it shall be used either to reduce and pay for capital or to the payment so far as it may be needed of the cost of additions and extensions to the property.

The city reserves the right at any time after the $6,300,000 shall have been paid—first, by ordinance to reduce fares and thereby diminish the amount of its share of surplus income, but not to exercise this right so as to impair or reduce materially the amount of the company's share below the amount the company would have received if the rate of fare had not been reduced; and second, by ordinance approved by the vote of the people to direct that the whole or any part of the surplus income shall be used for any public purpose. When the city's surplus is used to reduce capital value the method by which the reduction is made must be satisfactory to the city comptroller. When the surplus is used either to reduce capital value or to pay for additions and extensions it shall be taken to be an investment by the city of so much money in the property toward the acquisition of title to the property, and to that extent the city shall be an owner of an equitable interest in the property subject to the company's right to capital value, the return thereon and participation as defined in the ordinance. The capital value shall not to any extent be increased by reason of the use of the city's surplus in additions or extensions. The amount of the city's share of the surplus used for this purpose shall be considered for the purpose of determining the time when the company's right to participate in the earnings shall cease and the city's right to possession of the property shall mature. As capital value is reduced, the 6 per cent return shall decrease in proportion. The rights of the company, its security holders and any others claiming any interest in the property shall be no greater than the right to be paid the capital value of the property from time to time, so that the city shall be equitably entitled to every part of the property subject only to the obligations against the same, including all extensions and additions, excepting those specifically named in the ordinance to satisfy the capital value, returns thereon and the company's right of participation.

MAINTENANCE, DEPRECIATION AND DAMAGES

At the beginning of each fiscal year the board of control shall determine what percentages of the gross earnings shall be used for (*a*) maintenance, repairs, renewals and depreciation, and (*b*) for personal injuries and property damage claims arising after the adoption of the contract. The amounts for maintenance, repairs, renewals and depreciation shall not be less than 16 per cent of the gross earnings of the previous year, and that for damage claims not less than 4 per cent. If the full percentages be not actually expended in any year the balance shall be deposited and credited on any amount in excess of these percentages determined to be necessary to be set aside for the same purposes during the next or any preceding year. In the event that the city should purchase the property the accumulation for maintenance, repairs and depreciation shall be paid to the city. The reserve for damages shall be applied to the payment of such claims and the balance if any shall be applied to the current liabilities of the company. The depositary may invest and loan the money so as to obtain a reasonable return of interest. The percentages fixed shall in no wise limit the obligation of the company to keep the property in first-class condition or pay just claims for damages.

ACQUISITION OF PROPERTY BY CITY

Whenever by the application of the city's share of surplus to the reduction of capital value the capital value shall become equal to an amount not in excess of 50 per cent of a sum made up of the capital value and the cost of extensions and additions, the city shall at once become the owner of all the property of the company in Jackson County, Mo., and entitled to possession thereof, subject only to a lien securing the payment of the balance unpaid of the capital value in Missouri. Whenever at any time by the application of the city's interest in the surplus income to the reduction of the capital value and to the payment for extensions and additions to property and by payment by the city to the company of cash, the capital value shall be so reduced, or the actual value so increased, as that unpaid portion of the capital value shall not exceed 50 per cent of the sum above mentioned, then if the city shall also pay to the company in cash the value of the remainder of its right to participation and the cost, if any, of redeeming before maturity such mortgage bonds of the company as it may be necessary to redeem in order to accomplish the purpose, not exceeding a premium of 3 per cent on the bonds to be so redeemed, the city shall thereupon become the owner of the property in Missouri and entitled to possession subject to a lien to secure the payment of the unpaid portion of the capital value and any mortgage securing the same or any part thereof. Whenever such capital value shall be reduced by any of the methods aforesaid to 50 per cent of the above sum, the company's right to participation in the surplus shall cease and the entire surplus shall belong to the city.

The city may at any time pay for the entire capital value. If the city exercises this right prior to the time such capital value shall have been reduced by the methods aforesaid to one-half of the sum, the city shall also pay to the company the value of the remainder of the company's right to participate in the surplus income and also the cost of redeeming before maturity mortgage bonds in order to accomplish the purpose, not exceeding a premium of 3 per cent on the bonds to be redeemed. In such event the company shall deliver to the city or its nominee such instructions as may vest the property to the city or its nominee, free of all liens except such as the city may by ordinance authorize. If, however, before the company's right to participation in the surplus income begins the city should pay in cash the entire capital value and also all sums due and a return thereon as well as the sums necessary to redeem bonds, then there shall be no payment on account of the value of the right of participation, but in such event the city shall take the property only for municipal operation and ownership and shall continue to own and operate the property for five years thereafter. In the event that the city shall desire to sell the property or to grant the right to operate to another within this period of five years, then the city shall pay to the company the full value of the company's right to participation in the surplus income.

SALARIES

The company shall pay to each of the members of the board of control the same salary for service not less than $6,000 or more than $10,000. Such salary shall be approved by the city directors. The company shall pay the arbiter such compensation as shall be fixed by the board of control and the arbiter in their award. The company shall pay its officers, agents, attorneys and directors such compensation as will be commensurate with the services required of them, taking into consideration compensation of other corporations of similar character for like services.

The company shall not discriminate either in favor of or against any person because of his or her affiliation with any labor organization. The city shall have the right, for municipal purposes only, without the payment of any compensation to use the poles and conduits of the company to carry signal, telephone, telegraph and electric light wires and lamps of the city. The city shall not have the right to use such poles or conduits for the purpose of supplying power or light to private consumers in the event that it hereafter establishes a municipal electric lighting plant.

In the event that the city shall not have purchased the property at the expiration of the franchise the city shall have the right either to take over the property on payment of the unpaid portion of the capital value or to transfer the right to any person or corporation. If the city at or after the expiration of the franchise shall grant a right to another company to operate a street railway along streets and public places constituting a whole or a substantial part of the system of the company, the city shall require such new company to purchase and take over the property and pay therefor in cash. The city may require such new company to pay to the city an additional price and to perform other obligations. The expiration of the franchise shall not have the effect of terminating the mortgage indebtedness existing against the property with the approval of the city. At the expiration of the franchise if the city has not purchased the property in its own right or by a licensee, the city may require the company to continue to operate according to this contract, pending purchase or other arrangement. If no purchase or other arrangement shall be made, the company's rights shall terminate and the city through its trustees shall take over the property subject to the unpaid portion of capital value and operate it, but shall apply all surplus income to the payment of capital value and return thereon until its entire payment shall have been made.

Meeting of Block Signal Committee of Illinois Electric Railways Association

A meeting of the block signal committee of the Illinois Electric Railways Association was held at Chicago July 9. Those present were John Leisenring, chairman; E. F. Gould, W. F. Carr, B. J. Fallon and L. E. Gould. Mr. Leisenring announced that President Budd had appointed L. E. Gould, western manager ELECTRIC RAILWAY JOURNAL, to membership on the committee.

Several topics for consideration in forthcoming reports were considered. These topics included: "What Other Associations Are Doing in Signaling," "Highway Crossing Protection," "Automatic Signal Maintenance and Operation."

It was decided that the subject of highway crossing protection should be studied and a report should be made on this subject at the September meeting of the association. The consensus of opinion was that the problem of properly protecting highway crossings was of especial interest at this time and therefore would be valuable for early treatment. Individual members of the committee arranged to prepare data on different phases of the subject and will report to the chairman some time in August. The assignments made were: E. F. Gould, census of the bells in use by member companies; W. F. Carr, the history of the subject, the increased need and where and why; B. J. Fallon, types and costs of gate or watchman protection; L. E. Gould types and costs of crossing signals and pictures; John Leisenring, maintenance and operation.

The South Melbourne (Victoria) Council has decided to construct an electric tramway system from Princes Bridge through South Melbourne to Middle Park at a cost of $311,680.

Kansas City Metropolitan Franchise Campaign

Some particulars in regard to the systematic method of conducting the street railway franchise campaign in Kansas City which resulted in extension of the franchise may be of interest. The election occurred July 7. In the campaign of 1909 when the question was submitted to the electorate the company was defeated. This year it was decided desirable to learn if possible and tabulate in advance the opinions of the voters. In this work the registration lists of the city, the city directory, the telephone directories and the lists of employees were used.

P. J. Kealy, in charge of the negotiations for the receivers of the road, and C. F. Cole, auditor for the Metropolitan Street Railway, held several conferences on this matter with the result that Mr. Cole devised a system for the listing of voters. It has been said since the election that this card system was responsible for the victory of the railway. Of course, the card system had the support of every employee of the company, in all nearly 4000, the assistance of every friend of the company and the approval of every high official who studied its working.

FIELD CARDS FOR FIRST REPORT FURNISHED TO EACH OF 4000 WORKERS

The franchise measure, regardless of expressed opinions, could not be called a party issue, even though the draft was made under the Democratic administration. It was not safe to assume, therefore, that the measure would receive the Democratic majority in the previous mayoralty election. All parties had to be considered in taking the preliminary poll, hence the card system

At the outset Mr. Cole issued field cards to all employees of the company with the request that they get a statement from friends and foes alike. No effort was to be made to convert a man but simply to secure a statement of the general sentiment existing among the voters. This field card had space for the name of the man interviewed, the interviewer, the place and class of employment of the man interviewed, a like space for the same information concerning the interviewer and space also for the expressed stand—"for," "doubtful" or "against" the extension of the franchise. This card was signed and turned in at the general office and went to the auditing department to be catalogued and filed.

SPECIAL CARDS FOR CREDITING VOLUNTEERS WITH REPORTS SUBMITTED

On reaching the office it was checked with the registration list in order to eliminate any but legalized voters from the files. The files were arranged in separate compartments for the three divisions of the classes. When a voter was found to have registered from the wrong address an effort was made to ascertain the reason. Where he was found to have moved within the legal limit a note was made, and he was classed as "not regularly registered." When all points were satisfactorily settled, the information on the field card was transferred to the office card which gave the name, residence, ward and precinct of the voter and his stand on the question.

CARD FOR INDIVIDUAL VOTER WITH RECORD OF REPORTS RECEIVED

When a voter was found in the doubtful column an effort was made to learn the cause of his doubts. When this was learned, literature covering the points in doubt was mailed to him with a request that he make a call or write a letter on any point not entirely clear to him. This way of getting in personal touch with the voters had the effect of making them ask questions and become familiar with the measure themselves from new viewpoints.

After the entire city had been visited by the men of the company and the districts had been singled out, the auditor knew in which sections the sentiments were strongest "for" and "against" the measure so that he planned his campaign accordingly. Mr. Kealy announced to the opposition his willingness to answer questions or debate the measure at any time. The same men received booklets and leaflets covering the questions which had been raised in the opposing press, with the result that many votes were made even in the hotbeds of opposition.

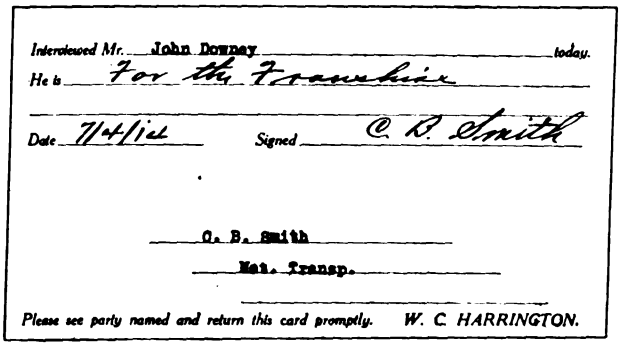
FILE CARD FOR TRANSFERRING AND CATALOGING OF INFORMATION CONCERNING REPORTS RECEIVED

No voter was classified until a reliable statement had been received. Where one interviewer reported a voter "for" the measure and another reported him "doubtful" or "against" it a tracer was always sent out to get the real stand of the voter. The cards were not only classified alphabetically and by ward and precinct, but they were further classified under the head of employment and employer. This was found to be a very successful plan, for in many cases where the voter had expressed no definite stand while the employer was friendly to the measure, co-operation was secured from the various commercial bodies which had endorsed the proposal.

The cards also furnished a reliable record for the workers on election day in getting the vote out. As each field man had a daily report on every voter in his district reported "against" the measure he was able to keep up the work until the time the polls closed on election day.



Interviewed Mr. John Downey today.

TRACER SENT OUT IN CASE OF "FOR" AND "DOUBTFUL" REPORTS BEING RECEIVED FOR SAME VOTER

The election was carried by the work of the field men backed by the aggressive methods of Mr. Kealy and his assistants. The fact that the opposition started its campaign long before the franchise draft was completed left the railway and administration people with nothing to do but to refute the statements and get the information to the voters. This was brought about by having the questions most dwelt upon by the opposition printed in leaflets which explained the true meaning of each clause and showed the mistakes of the opposition. The employees of the Metropolitan Street Railway Company started out to gather in 4000 votes and succeeded, while the campaign managers through the information furnished by Mr. Cole and his department converted the rest of the doubtful ones.

We have information from another source that this party is not favorable to the franchise.

Please talk with him again and confirm or correct your original report on enclosed card.

LEAFLET SENT OUT WITH TRACER CARD

On the Saturday preceding the election Mr. Cole estimated that the franchise would carry by more than 5000 votes. More than 30,000 names were handled by Mr. Cole's staff prior to the election. That his records were thorough was demonstrated by the fact that from some wards more names were handled than there were voters in the municipal election in April. Shortly before the election Mr. Cole announced that of the voters canvassed, 15,480 were for the franchise and 5134 against. He assumed that 10,000 of the 15,000 voters not heard from were against the measure, and that it would therefore pass by a majority of 5346. The official count showed a majority of slightly more than 1000 above this figure.

Much has been said of the money spent in carrying the election, and some people in Kansas City are still crying that there was fraud on election day. Nevertheless, the card lists in the auditing department show that the election was fought out and won before the polls were open on election day. The expense of the campaign, it is safe to say, was not as great as the expense of the 1909 campaign, when the measure went down to defeat because an organized effort was not made to get the information to the voters. This time the spellbinder was lacking on the street railway side of the question, but in his stead an engineer or the Mayor of the city was sent out to debate the question with any and all parties. Every invitation was accepted by the campaign managers, and in no case was an opportunity lost to enlighten the voters.

Street Railways in Germany

The official statistics covering street railways of Germany for the year ending March 31, 1912, show a total of 283 systems, of which 194 are located in Prussia. This is an increase of fifteen in the number of railways. The total length of track was 4811.2 km (2983 miles), of which 3419.33 km (2120 miles) was in Prussia, an increase of 6.21 per cent. The largest railway is the Grosse Berliner Strassenbahn which, including suburban lines, operates a total of 353.6 km (219 miles). The 237 electrically operated roads had a total of 11,884 motor cars, 20,723 passenger trailers, 987 freight cars and forty-six electric locomotives. The Grosse Berliner Strassenbahn, the largest system, operates 2786 cars with a total of 97,931 passenger capacity.

The number of municipal lines has increased in Prussia from 120 to 132. The private systems now number 136, an increase of two. The largest syndicate is the Allgemeine Lokal & Strassenbahn Gesellschaft, Berlin, which operates seven systems with a total of 141.1 km (87.5 miles). The total motor car mileage of all German street railways was 504,875,589 km (313,022,865 miles) and train mileage 690,322,738 km (428,000,097 miles). The number of passengers carried was 2,567,155,295, an increase of 10.8 per cent. The freight handled amounted to 3,261,658 car km (2,022,228 car-miles) and 1,794,585 ton-km (1,112,642 metric-ton miles), an increase of 7.3 per cent. The earnings of the twenty-eight largest street railways varied from 4.6 pf. (1 1/2 cents) per passenger to 12.8 pf. (3.2 cents) per passenger. The last figure applies to both the Hamburg street railway system and the Berlin rapid transit system. The Berlin surface railways, however, earned only 9.5 pf. (2.4 cents) per passenger. The earnings per mile on the Berlin rapid transit system were 403,511 marks ($161,408) and on the Grosse Berliner Strassenbahn 169,642 marks ($67,856). In both cases these figures were the maximum for rapid transit and surface operation respectively. In general the average earnings per mile increased 5.1 per cent.

The operating expenses for all German street railways amounted to 86.4 per cent of the earnings. Of the 170 street railways in Prussia, sixteen paid no dividends, three paid up to 1 per cent, thirteen up to 2 per cent, seventeen up to 3 per cent, twenty-six up to 4 per cent, nineteen up to 5 per cent, sixty-eight from 5 to 10 per cent and eight more than 10 per cent.

Hanover with 2.66 miles per 10,000 inhabitants has more street railway trackage for its population than any other city in Germany, but this includes a large amount of suburban mileage. The city next in line is Dresden, with 1.54 miles per 10,000 inhabitants. Dresden has the highest number of trips per inhabitant with 237.5 a year. Berlin has only 186.2 and Hamburg 150.8 annual trips per inhabitant.

Pacific Claim Agents' Association

Abstracts of Papers Presented by Messrs. Bishop, Handlon, Boynton, Carson and Allen at the Pacific Claim Agents' Association Convention Held in Spokane, Wash., July 9-11

The sixth annual convention of the Pacific Claim Agents' Association was held at Spokane, Wash., on July 9, 10 and 11. Papers presented on topics dealing with the prevention of automobile accidents, the most effective methods for prosecuting fraudulent claims, co-operation between the operating and claim departments and the securing of statements from all injured parties are abstracted as follows.

PREVENTION OF AUTOMOBILE ACCIDENTS

BY S. A. BISHOP, GENERAL CLAIM AGENT PACIFIC ELECTRIC RAILWAY, LOS ANGELES, CAL.

The prevention of automobile accidents has come to be almost as important as the elimination of war. Statistically we find that fatalities and injuries directly attributable to the operation of automobiles compare in number with the dead and injured through conflicts between nations, and the dead and maimed in railway accidents. Many statisticians charge a railway with the death and injury of a number of persons riding in an automobile with which a railway train collides on a road crossing. I predict the time will come when the circumstances of such accidents will be examined to ascertain whether such casualities should be put in the railway or in the automobile column. It is my contention that when a driver of an automobile brings about a catastrophe by undertaking to pass over a railway crossing at high speed at such close quarters to an approaching train that collision is inevitable, such accident is an automobile accident, and should not, in any sense, be charged to the transportation company whose train unfortunately came in collision with the machine.

I cannot believe that any claim agent's observation of automobile accidents has brought him to any other conclusion than that, since the majority of such accidents are attributable not only to the negligence of the driver of the machine, but also to the concurrent failure on the part of each and every occupant of the machine to "look and listen," the only possible remedy is such as may be devised to induce the drivers and occupants of automobiles to exercise ordinary care. Municipalities should pass stringent regulations for the operation of automobiles, and the police department should, as in Los Angeles, stringently enforce the rules laid down. The county and state in turn have the same obligation to meet. Uniform laws should be promulgated and rigidly enforced to restrict speed within reasonable limits and to deter, if possible, the drivers of automobiles from following their impulse, which is to go ahead and leave the other fellow, who may be in charge of another automobile, trolley car or railroad train, to slow down or stop to prevent an accident.

There should be some test as to the fitness of the individual to operate an automobile as well as an examination to measure his efficiency as a driver. It is not unreasonable to require that all drivers of automobiles should have fair vision, be able to hear and be neither afflicted with the infirmities of age nor the reckless spirit of youth. There should be the further restriction that no person under the age of twenty-one years, or beyond the age of sixty years, be permitted to drive a machine. No transportation company could possibly contemplate putting in charge of the operation of any car or train a man who had no previous experience and no knowledge of the mechanism of the car or engine, who had never been required to pass an examination as to hearing or sight, and who perhaps was less than sixteen years of age or older than seventy years of age. There is no reason why similar rules should not be made applicable to the automobile driver.

Unless legislation can be had along the line indicated, automobile accidents will increase in proportion to the number of new cars manufactured and put into service. At least two new and inexperienced drivers are required for every car turned out, since the owners and the several members of the families are all ambitious to take a turn at the wheel. The prevention of automobile accidents depends upon the individual driver of the automobile, and unless he is fit to drive we shall probably fail to induce him to drive carefully. The only safe way is to make it more nearly possible by law to obtain an efficient driver, for an appeal to him to exercise ordinary care in operating his car ought to prevail.

I venture the opinion that conditions will grow much worse and accidents more numerous before we may expect to secure the much-needed legislation. This will come only after the legislators are induced to act through the influence and weight of the opinion of the public at large. A majority of all of the people must be won over to a proper appreciation of the necessity for such laws, and each and all of us can do much to influence the opinion and the attitude of those with whom we come in contact. We should, therefore, make a concerted effort along these lines.

THE MENACE OF THE AUTOMOBILE

BY J. H. HANDLON, CLAIM AGENT UNITED RAILROADS OF SAN FRANCISCO, CAL.

Automobile accidents are increasing in number so rapidly that to-day they are a source of much concern to the average claim agent. To illustrate: in 1909 the cars of the United Railroads of San Francisco were involved in only 388 collisions with automobiles. In 1910 there were 476 auto collisions; in 1911, 748; in 1912, 1076, and in 1913, 1404. Accidents of this nature are not only costly, for they often involve injury to the occupants of the automobile as well as damage to the vehicle, but they are also annoying to adjust, because a dispute almost invariably arises as to the extent of the damage. The reason for this is that it is the practice of many repairmen thoroughly to overhaul the damaged vehicle while it is in their possession. They do not attempt to confine their work to the repairs made necessary by the accident. Usually the owner does not hesitate to present the entire bill, and he resents the suggestion that many of the items were not due to the collision. In case the claim is without merit and is therefore rejected, a certain type of claimant, proud to advertise the fact that he is the possessor of an automobile, will go into the highways and byways, shouting bitter words of condemnation against all corporations except those in which he is a stockholder.

How can electric railways relieve themselves of this expense and annoyance? In my opinion state laws should be passed requiring automobile drivers to be not under twenty years of age and able to pass an examination of their eyesight and hearing as well as practical tests of their mental and physical fitness to operate an automobile. An instance is related where a chauffeur who was deaf thought that he was blowing a warning horn, when, as a matter of fact, the horn was out of order. He was not aware of that condition until his companion so informed him. Such a man should never have been granted permission to operate an automobile.

Street railways, in the interest of safety and economy, require platform men to be of a certain age, height and weight and able to pass a physical examination, particularly as to their eyesight and hearing. One of the cities of the Pacific Coast has an ordinance prohibiting motormen from operating cars until they have had seven days' training within the limits of the city, regardless of their previous experience. Yet street cars are operated on fixed tracks known to pedestrians and drivers of vehicles and are so geared that they cannot exceed a certain speed limit. On the other hand, automobiles, capable of traveling at a much higher speed than street cars, are permitted to roam the streets at the will of the driver. Surely, under these circumstances, rigid requirements should be exacted of the man who seeks a chauffeur's license.

Efforts should be made to co-operate with the local automobile association by having that body designate certain streets as main thoroughfares for automobiles, signs to be placed accordingly. The railway could then require its motormen to bring their cars to a full stop before crossing such streets.

Another means of securing the aid of the automobile association would be to prevail upon it to petition the city to appoint a hundred of its members as special officers. These special officers would be required to report to the secretary of the association all chauffeurs violating the speed ordinances. This officer could then notify the chief of police of all such offenses. In case the same person is reported for having exceeded the speed limit on three different occasions, the association could ask for a warrant for the arrest of the offender, and it would then become the duty of the attorney of the association to endeavor to secure a conviction.

The advantages of such a method are apparent. The statement of the motorcycle police officer who makes the arrest is usually questioned by the offender, and the committing magistrate is in doubt as to how to proceed. Influence is also brought to bear upon the judge and many speed maniacs are not punished. The moral influence of the association, however, would stiffen the backbone of the judge, and the member of the association at fault would feel the burden of fighting his fellow members on an issue of this kind.

Ordinarily, the chauffeur who is speeding his automobile is watching for the approach of the motorcycle policeman and he reduces his speed the moment the officer enters his range of vision. With fellow members of the association on the lookout for such offenders, the lawbreaker would not be able to ascertain so readily the official capacity of the occupants of the automobile approaching him and for that reason he would hesitate to take a chance. A further advantage of such a scheme as this: A person driving an automobile can gage the speed of another automobile by his speedometer and he is, therefore, qualified to testify as an expert witness.

In Portland, Ore., the 100 special officers of the local automobile association have been so successful in eliminating speeding that the city has abandoned the use of the motorcycle policemen, and arrests for speed violations rarely occur. In one instance, the automobile association of that city prevailed upon one of the judges not to fine the offender but to penalize him by depriving him of the use of his automobile for a period of six weeks. It is understood that there is a law in New Jersey authorizing the arrest of the automobile. The vehicle is then placed in a garage for such a period as may be determined by the judge. At the expiration of the specified time the owner pays the garage expense and court costs and obtains possession of the automobile. Such punishment is felt very keenly by the automobile owner and the results of temporarily depriving him of his automobile are very effective.

Experience in investigating automobile accidents reveals the fact that professional men who drive automobiles are more careless than professional chauffeurs. The average professional man does not confine his entire attention to his duties as chauffeur but is often thinking of other matters. The professional chauffeur, however, realizes that his livelihood depends upon the automobile being operated safely and governs himself accordingly. Physicians are the most careless drivers, and the situation is so acute in San Francisco that there is serious thought of designing for the desk of every physician in that city who drives an automobile some device which will be a gentle reminder to him that he must exercise ordinary prudence when acting as a chauffeur.

It would seem advisable to place placards containing safety rules in every garage in the city where they could be easily read by each chauffeur as he is about to take charge of his automobile. These placards would serve as a timely suggestion and a daily warning of the dangers of the street. Lectures on "safety first" could also be given at the local automobile clubs. In one city in Texas several hundred letters were sent to automobile owners by the claim agent of the local street railway. Instances were cited where automobiles had violated the traffic rules. Of the 200 replies received but two or three persons took exceptions to the criticism. The others received the letters in good spirit.

CO-OPERATION BETWEEN CLAIM AND OPERATING DEPARTMENTS IN SELECTING EMPLOYEES

BY B. F. BOYNTON, CLAIM AGENT PORTLAND RAILWAY, LIGHT & POWER COMPANY, PORTLAND, ORE.

The claim department can assist the operating department in obtaining good and efficient employees by closely watching the accident reports, because a good, competent motorman or conductor always makes out an intelligent, comprehensive report when an accident occurs and furnishes the names of all available witnesses. Such men do not turn in reports like one recently received, in which the conductor wrote in the space provided for his statement, "I know nothing about the accident," and the motorman added, "The conductor's report is correct." The investigation of these reports shows not only the carefulness but also the average intelligence of the men who make out the reports. By carefully studying the good reports and the poor ones and furnishing the results of research to the superintendent, claim agents can greatly assist him in ascertaining what type of men he has under him.

Furthermore, by examining the reports of investigators who interview the witnesses to accidents, claim agents will find that the passengers are prone to state what they think of the trainmen who had the accident. For instance, a report was recently received to the effect that a motorman ran by a station so far that the rear end of the train passed an open cattleguard. The conductor gave the bells to back up to the platform, where the passengers were waiting. This the motorman refused to do, compelling the passengers to walk down to the train. In so doing a lady fell through the cattleguard and was slightly bruised. By informing the operating department of the attitude of this motorman, the claim department proved at once that the company had an employee who certainly did not belong on a street car at the present day.

Trainmen at different times have altercations, quarrels and fights with passengers. Reports of these are all made to the claim department on accident forms. This department should immediately notify the operating department as to what has happened, and, when the investigation is completed, take the matter up again and show the result of the investigation. In this manner the operating department is enabled to eliminate those employees who lack a certain "mental and moral fitness."

A man may be a good operating man, and yet, when he has an accident for which he may be blameless and is put on the stand to testify, he may not have sufficient intelligence to tell the facts truthfully. A man of this type is very undesirable, for his mental powers may be so deficient that when the opposing attorney gets hold of him he may tell any story the attorney desires. In some instances the evidence given on the witness stand by a motorman or a conductor has meant the direct loss of the case when it should have been won. When a man of this type is discovered, the operating department should be notified at once in order that he may be eliminated from the ranks, for a man who has not sufficient intelligence to get on the stand and tell the truth should seek some other vocation than operating a street car.

Trainmen should at all times be given the benefit of the doubt, but in all instances where the investigation shows, without any doubt, that a trainman is not proficient and careful in the performance of his duties, such as the handling of his car, being courteous to the public and at all times making out his reports promptly and intelligently, he should be removed. The claim department can assist the operating department in making motormen and conductors more efficient by having the trainmen sent to them for instruction regarding accidents before the men are given charge of a car. Some representative from the claim department is better fitted to talk to the trainmen concerning the elimination of accidents than anyone else. A great many men are delinquent in looking after accidents simply because they have not received instruction from those qualified to give it.

There are no two departments connected with a street railway that should be in closer touch than the claim department and the operating department, for without harmony and co-operation between these the key to success is lost. In a great many instances the claim department and the operating department do not realize the close relationship between the two. Good, honest, efficient work by an intelligent claim agent greatly helps the operating man, and good, careful, competent work by the operating man and his staff minimizes the number of accidents and helps to reduce the claim man's troubles.

The day has come when a claim agent's work does not stop at the mere settlement of claims. He must be a man of brains and possess sufficient tact to affiliate and work with the operating department in such a way as to eliminate accident hazards. This can be done in many ways through various educational systems, such as lectures and talks, safety organizations, safety meetings, inspection trips, and meetings of different kinds where he mixes with the trainmen. Through these things he is leading, not driving—teaching the men in such a manner that they are receptive to what he has to say and thereby become more efficient and of greater value to their companies.

MOST EFFECTIVE METHODS FOR PROSECUTING FRAUDULENT CLAIMANTS

BY HARRISON ALLEN, ATTORNEY, PORTLAND RAILWAY, LIGHT & POWER COMPANY, PORTLAND, ORE.

All will agree that the prosecution of fraudulent claimants and professional witnesses presents a question of the greatest difficulty. The law provides ample remedy in statutes concerning perjury and subornation of perjury, but it is a well-known fact that few prosecutions have ever been instituted and fewer convictions had. This condition of affairs arises from two causes:

First: The tendency of courts, prosecutors and laymen to overlook the necessity of preserving the sanctity of the oath.

Second: The application of the law to the evidence.

The statutes generally provide that if any person takes an oath and then wilfully swears falsely in regard to any matter or thing concerning which the oath is required, such person shall be deemed guilty of perjury. If any person shall procure another to commit the crime of perjury he shall be deemed guilty of subornation of perjury.

In the treatment of damage claims many cases are encountered which are known to the public service claim agent and the attorney as "blind cases," concerning which no information has ever been received before the filing of the complaint in court. These cases, nine times out of ten, originate with the professional "ambulance chaser," who in turn takes them to some attorney known to be a "safe and sane" suborner of perjury. The machinery for manufacturing evidence is then started and a physician is called in who will, for the contingent fee named, supply the necessary medical testimony. The result is that when the case is finally laid upon the table in the court room it seems to be almost perfect.

To uncover this conspiracy is an extremely difficult feat. Conditions could be greatly improved, however, if the claim department of every public service corporation would spend more time and money in running down the professional crooks engaged in this nefarious business. The Claim Agents' Association and each public service corporation should announce it is proposed henceforth to spare no expense in bringing such parties to justice.

Whenever a blind case is filed, steps should be at once taken to investigate the past life and character of the plaintiff and his present environment. An effort should also be made to discover the witnesses for the plaintiff, and when this is accomplished the witnesses should be given the same searching investigation as the plaintiff. An examination of the plaintiff by disinterested physicians should be promptly demanded, and if it can be discovered who the plaintiff's physician is, he should be interviewed. If upon the trial of the action it reasonably appears to the claim agents and attorneys for defendant that false testimony has been given, the public service corporation should stand behind a vigorous prosecution of the offender, notwithstanding the fact that it will run the risk, in the event of acquittal, of being sued for damages for malicious prosecution.

The attorney who handled the case for the plaintiff should be given a rigid investigation by the Bar Association, whose rules and regulations in every state are ample to cope with the situation. The Bar should be given to understand that hereafter the attorney who devotes his time to chasing the ambulance and suborning perjury will be handled accordingly. The doctor should also receive attention at the hands of the Medical Association upon charges duly preferred.

Each of these steps, however, is fraught with difficulty. The claim agent and public service corporation are, for some reason or other, neglectful of this important matter. The attorneys who are members of the Bar Association and their grievance committees are too prone to give the brother attorney the best of it. The medical profession is one from which there can always be secured a doctor with a pliant conscience and an eye to the florescence of gold and silver. These knights of the itching palm are the cleverest of all, for they deal in a science most mysterious to the lawyer and layman.

At present around Portland every person who is injured, and every plaintiff in the blind case of perjury, turns out to be afflicted with "traumatic neurasthenia." This is the term applied to a nervous wreck. It is a safe estimate that within the past two years in nine-tenths of the complaints filed in the courts of Oregon by personal injury plaintiffs, it is claimed that the plaintiff is a nervous wreck. For this the doctors are at fault.

It is said that every man in the world possesses some symptom of insanity, but no man is really crazy unless he possesses at least two or more. One well-known authority has also remarked that every physician at the time he commences the treatment of these blind cases of neurasthenia possesses at least one symptom of the complaint. When he has followed the business and loaned himself to the persecution of the public service corporation for a sufficient period of time, he then possesses at least two symptoms, which make him a good witness. The only sure cure is to place him on the payroll of the public service corporation at a handsome yearly stipend.

Another great difficulty in these cases is the trend of court decisions in the application of the law to the evidence. For instance, it is generally held by the courts that while there are crimes of perjury and subornation of perjury, a conspiracy to commit either of the crimes is not a substantive offense, and therefore evidence of the conspiracy to commit the crime of perjury is not admissible. It is also held that proof that the defendant has made a statement outside of court contradicting the one given under oath, is not evidence of perjury. In an ordinary case, however, a witness may be impeached by testimony showing that he has made contradictory statements at other times and places. A search of the digests of Oregon, Washington and California shows that in the history of all three states the number of prosecutions for perjury has been very small and the acquittals 80 per cent.

SECURING STATEMENTS FROM EVERY INJURED PERSON

BY GEORGE CARSON, GENERAL CLAIM AGENT PUGET SOUND TRACTION, LIGHT & POWER COMPANY, SEATTLE, WASH.

As a general rule, signed statements should be taken from all persons who make claims or might reasonably be expected to make claims. There are exceptions, however, to this general rule. It is not at all advisable in cases where the injury is serious to rush immediately after the accident to the injured person with a view of getting him to sign a statement. The two reasons for this are as follows:

1. Should it be decided later that the case was one the company desired to settle, it would create a suspicion in the mind of the claimant that the representative of the claim department was making an effort to tie him up in some way for the purpose of defrauding him out of what might be justly due him. The result might be that the claimant would so mistrust the representative of the claim department that he would put his case into the hands of an attorney.

2. A statement obtained under those conditions would not be of any value in court in case of suit. It would be impossible to convince a jury that it was procured in good faith by the claim department representative. In fact, the use of such a statement obtained under such conditions would, in a trial be a positive detriment to the defense. In all probability the jury would punish the company for such a method of procedure by assessing large damages.

It is well, however, for the representative of the claim department to call on the injured man soon after the accident for the purpose of sympathizing with him and assuring him that the company will deal fairly with him. Of course, during the interview, the representative of the company should carefully note what the injured party says with reference to how the accident occurred, how long he has been a resident of the city, where he formerly resided and how long, whether he had received any other injury or made a claim against any other company, etc. This, however, should be done skilfully so as to avoid antagonizing the injured person. When the injury is not serious, and the claimant calls at the office or sends for someone from the claim department to visit him, a written signed statement should always be obtained. In all such cases, however, the claimant should be made to understand thoroughly the purport of what he has signed and, if convenient, a witness to the signature should be obtained.

The value of a statement from a claimant lies particularly in the lead it gives to the claim and legal departments in the event the claimant is disposed to be unfair and suit results. There is another phase of this matter, however, which is often discussed, namely, What effect will the calling on the injured party by a representative of the claim department have upon him with regard to leading him to present a claim which he would not have presented if the call had not been made? In other words, does such a call suggest the idea of damages to the mind of the claimant? There seems nothing in this. The fact that the representative of the claim department calls on a party injured in an accident does not call for the payment of money unless the company feels justified in so doing. Furthermore, it is quite certain that before the time expires in which the injured party can sue, he will learn that he has a proper claim against the company, if such should actually be the case.

Virginia Commission Report

The eleventh annual report of the State Corporation Commission of Virginia for the calendar year 1913 is devoted in the main to the following: Formal orders and opinions of the commission, charters, amendments, mergers and revivals of charters, assessments of property and franchises of public service corporations, and classifications and rates for steam railroads, express companies and telegraph companies. In an appendix separately bound there are given reports and statistics of canals, steam and electric railways and other corporate companies for the fiscal year ended June 30, 1913. The total value of the physical property, exclusive of franchise values, of electric railways as assessed by the commission in 1913 was $8,903,055. The total State tax assessed against electric railways was $81,002. The gross transportation receipts on the steam and electric railroads in the State for 1913 amounted to $68,121,265, as compared to $60,642,118 for 1912. The total mileage of electric railways for 1913 was 639.98, an increase of 135.95 miles over 1912. The commission states that it believes "that most of the public service corporations of the State are discharging their duties to the public with reasonable diligence, and that while complaints continue to be numerous not many of them are serious in character and general conditions are good."

Co-operative Plan in Philadelphia

Abstract of Statement Made by T. E. Mitten Before Commission on Industrial Relations—Origin of Plan—Successful Results of Co-operative Committee

An extended account of the history and results of the co-operative plan in Philadelphia was recently made by T. E. Mitten, chairman of the executive committee Philadelphia Rapid Transit Company, before the United States Commission on Industrial Relations. Mr. Mitten explained that this plan was born of necessity after the extensive strikes of 1909 and 1910 on the Philadelphia Rapid Transit System. These strikes resulted in great loss on both sides, bitterness of feeling and demoralization of the service. In this emergency, E. T. Stotesbury was prevailed upon to assume, as a civic duty, the responsibility for the policy and business management of the company. The financing necessary to the buying of new cars and the general rehabilitation of the property having been accomplished, the new management undertook to build up during the five years following June, 1911, an adequate system of surface transportation.

CO-OPERATIVE PLAN

At that time the motormen and conductors were receiving in wages, pensions and death benefits approximately 21.8 per cent of the gross receipts. The management was convinced that by the introduction of larger cars and improved operating methods this percentage of gross receipts could be made to produce much higher wages to the motormen and conductors, provided co-operation and team work could be established between the men and the management. Accordingly, the co-operative plan was devised, whereby 22 per cent of the gross passenger receipts were set aside in a separate fund for use in payment of wages, pensions and death benefits to the motormen and conductors engaged in the passenger service. Furthermore, a co-operative committee composed of representatives of the men and the management was established for the consideration of ways and means for satisfying the public and the employees.

ORGANIZED LABOR

At the incoming of the Stotesbury management about one-half of the motormen and conductors were affiliated with the Amalgamated Association of Street & Electric Railway Employees of America, the remainder being divided between the local Keystone union and those not affiliated with any organization. The company stated in the co-operatve plan booklet (issued in August, 1911) that the management could not take a position either for or against organized labor. Moreover, while it could not require any of its men to belong to a labor organization it could, if as large a majority as two-thirds of its men desired that a contract be made with a labor organization, pay from the 22 per cent fund the sum of the dues of every man. A vote on this plan was taken on Nov. 2, 1911, and of the 6944 men qualified to vote, 4276 voted in favor of making a contract with the Amalgamated Association and 2366 voted in the negative, the affirmative vote being 353 short of the required two-thirds. Immediately after this vote a rupture occurred in the Amalgamated Association, the result being that those who had voted in favor of a contract became more or less evenly divided, some remaining as members of the Amalgamated Association, while others followed the leadership of C. O. Pratt. No one faction had a sufficient number to represent 25 per cent of the whole, while those who wore no union buttons whatever approximated 40 per cent.

In July, 1913, the motormen and conductors again had opportunity to vote by secret ballot upon the question of continuing the co-operative plan with the men as individuals. The result was, that of the 6805 men qualified to vote 4320 were in favor of so continuing the plan, as compared to 2028 votes in the negative.

CO-OPERATIVE COMMITTEE

The co-operative plan of August, 1911, provided for a co-operative committee composed of a representative motorman or conductor from each division, the management being represented by the superintendent of each division, together with the superintendent of transportation or his representative. At first, the division superintendents were instructed to select a representative motorman and conductor from each depot without regard to their factional affiliations. In April, 1912, each motorman and conductor had an opportunity to suggest the name of a motorman or conductor to represent his depot as a member of the co-operative committee. More than 87 per cent of the men so expressed their preference. While the original plan was to have only one motorman or conductor representing each depot, it was decided, following this election, that the co-operative committee would include two representatives from each depot, the candidate receiving the highest vote to be known as committeeman No. 1, and the candidate receiving the second highest vote to be known as committeeman No. 2. This afforded direct representation not only to the majority at each depot but also to the largest minority. In June, 1913, the plan was adopted of voting for co-operative committeemen by means of a voting machine, thus insuring a secret ballot. There was also established a vote committee consisting of three motormen or conductors, members of the co-operative committee, no one of whom shall be a representative of the depot at which the vote is taken. The vote committee counts and certifies to the returns.

To be eligible as a co-operative committeeman, the candidate must have been in the service for two years or more and assigned to a regular run. The power of recall is in the hands of the motormen and conductors, in that every twelve to fourteen months the committeemen must stand for re-election. The committee now includes twenty-eight motormen and conductors representing the fourteen operating depots. At the election of these men, approximately 95 per cent of all the motormen and conductors voted, the present members having received nearly 80 per cent of the total votes cast.

RESULTS OF PLAN

The co-operative plan has now been in effect for three years and the results have been excellent. It is generally conceded that the public is receiving a much more adequate service than formerly and that there has been an equal improvement in the courteous treatment received by the public at the hands of the motormen and conductors. The number of complaints received at the office have shown an 80 per cent decrease during the last three years.

Although nearly 20 per cent more passengers are carried to-day than at the time immediately preceding the inauguration of the co-operative plan, the number of accidents has been decreased 25 per cent and the number of fatal accidents has been decreased more than 35 per cent. While a part of this improvement is due to better and safer cars, there has also been a great improvement in the human agency and care.

INCREASED WAGES

More than 47 per cent of the employees are now receiving the maximum wage of 30 cents per hour, as shown by Table I.

TABLE I—Showing Comparative Rates of Wages for Motormen and Conductors for 1911 and 1914 and Also Employees Divided as to Time of Service

	Per Cent of Total, 1914	Rate of Wages 1914	Rate of Wages 1911	Per Cent of Wage Increase
New Men	5.42	25 cents	22 cents	13.6
After one year's service	7.04	26 cents	23 cents	13.0
After two years' service	10.09	27 cents	23 cents	17.4
After three years' service	14.34	28 cents	23 cents	21.7
After four years' service	15.70	29 cents	23 cents	25.1
After five years' service	47.41	30 cents	23 cents	30.4
Total	100.00	28.83*	22.8*	26.4*

*Average

INSURANCE AND BENEFITS

A co-operative beneficial association was established in November, 1912. The company formerly provided meeting room, light, heat, janitor service, printing and stationery for all independent sick and death benefit associations having membership among its employees. These associations, however, were found to be too limited in their scope to cover the entire force of employees. Furthermore, a large portion of their membership was composed of ex-employees. The company therefore suggested the formation of this co-operative beneficial association to include the employees of all departments. In lieu of the assistance formerly extended to the independent associations the company now contributes to the new association an amount equal to the entrance fees and dues paid in each month by the men, and it bears the expense of the management of the association.

This association provides sick benefits of $1 per day for 100 days following the first week's illness and a death benefit of $150. The entrance fee is 50 cents, with monthly dues of 25 cents. In addition to sick and death benefits the association also offers a co-operative buying plan, whereby members are enabled to make a saving of 8 per cent in the purchase of the necessaries of life. Membership is open to all male and female employees between the ages of 18 and 45 years, after a service of three months. Of the 10,000 eligible employees in all departments 9013 are now members. Whether or not employees elect to become members of this organization and enjoy its advantages rests solely with themselves. All are given to understand that any decision they may make does not affect their rights or standing with the company.

The benefits paid by the association since its organization include 99 death benefits for $14,155.65 and 1859 sick benefits for $50,740, or a total to May 31, 1914, of $64,895.65. Such benefits are in addition to the general insurance and pension plan, established in January, 1910, under which $500 is paid at the death to the actual dependents of any employee who has been in the service for two years and earns less than $200 a month. This plan also provides to employees who at the age of sixty-five years have completed twenty-five years of continuous service, a pension of $20 per month for the remainder of their lives. The benefits and pensions paid since the establishment of this insurance and pension plan have been as follows: 383 death benefits for $189,771.75, and 96 pensions for $48,375.35, or a total to May 31, 1914, of $238,147.10.

UNIFORMS

By the efforts of the co-operative committee, the motormen and conductors are now securing a higher grade of uniform at a lower price. The uniforms are purchased direct from two wholesale houses under contracts approved by the co-operative committee at the following prices:

	Stock or Ready Made	Made to Measure
Without label (non-union)	$11.75	$12.75
With label (union-made)	12.25	13.25

DISCIPLINE AND DISCHARGES

The basic principle of discipline under the co-operative plan is that the penalty for the infraction of any rule shall be no more severe than is found by experience to be necessary to insure proper service to the public and the maintenance of proper discipline. The old practice of discharging men as a punishment and thereafter reinstating them through the influence of others irrespective of the merits of their cases is not now permitted. Under the co-operative plan, discharge is used only as a last resort, the co-operative committeemen being most effective in preventing the discharge of motormen and conductors by advising them to mend their ways and by assisting in presenting all the facts to the superintendent of transportation in order to insure a thorough understanding of the true merits of the case before final action is taken.

The best evidence that the co-operative method of discipline is most effective is found in the decreased number of men discharged. In 1911, 1635 men were dismissed, or one in every five; in 1912, 855 were dismissed, or one out of eight; in 1913, 536 were dismissed, or one out of every twelve; in 1914, 334 were dismissed, or one out of twenty. Furthermore, there is a smaller number of men now resigning from the service. In 1911, 1390 men resigned; in 1912, 913; in 1913, 956 and in 1914, 337.

HOURS OF SERVICE

The management first determines the number of cars required adequately to serve the public at different hours of the day. If the total car hours required upon the street are divided so that there is the least possible wastage then the highest possible wage per hour has been accomplished. As the men are, therefore, interested in avoiding any wasting of their 22 per cent fund and also in dividing the hours of service to suit their own desires, the actual make-up of the runs and hours of service performed can be and actually is left to the decision of the men.

Upon the recommendation of the co-operative committee, the basis for the car schedules is that regular runs shall constitute from nine to eleven hours of service, all to be completed within a maximum of fourteen consecutive hours. The former practice provided for spreading runs over fifteen or more consecutive hours. Deviation from the foregoing rule is permitted only when the men so request. If the actual time for the run is below nine hours (Sunday time-tables excepted) the man is paid for nine full hours.

During the past three years under the co-operative plan the total seating capacity provided during the rush hours on all surface lines has been increased 50 per cent.

The results of the co-operative plan may perhaps be summed up in the conclusion that the increased efficiency of management, methods and men, due to co-operative effort, works directly to the advantage of the public in improved service and to the men in increased wages and improved working conditions.

After the completion of Mr. Mitten's testimony, H. G. Tulley, superintendent of transportation, was called as a witness to explain the character of the runs. He said that 23 per cent of all the runs are early straights; 34 per cent, late straights; 39 per cent, early swings, and 4 per cent, late swings. The runs are chosen by the men in the order of their depot seniority. The proportion of extra men to regular men is about 25 per cent.

M. F. Hughes, member of the co-operative committee and motorman from the Jackson Depot; Robert M. Kernaghan, conductor from the Frankford Depot, and John H. Collins, a senior conductor, testified that the co-operative plan as a whole has worked greatly to the advantage of the men. Thomas Kirrane, ex-conductor, and C. O. Pratt and William B. Fitzgerald, non-employees, also testified before the commission and criticised the co-operative plan.

Ethics of a Franchise

An official of H. M. Byllesby & Co. recently listed what he deemed the principal obligations of both parties to a franchise. As printed in one of the Chicago daily papers under the heading given above, they were as follows:

OBLIGATIONS OF A UTILITY COMPANY

1. Rendering of good, adequate and continuous service.
2. Fair and reasonable rate schedules.
3. No discrimination among customers of the same class, nor between classes of customers for like service.
4. Extension of service into all populated sections of the municipality and suburbs.
5. Earnest endeavor to market the greatest possible volume of service.
6. Adoption of approved inventions and developments in machinery and apparatus.
7. Sound financial management.
8. A high standard of physical excellence.
9. Public spirited attitude in all matters concerning the general welfare and advancement of the community.
10. Broad and liberal business administration.
11. Keeping faith with the people in all agreements, promises and announcements.
12. Strict obedience to law and no participation in politics.

OBLIGATIONS OF THE PUBLIC

1. The same degree of confidence, encouragement and respect that one business man accords to another.
2. Willingness to permit a fair profit on the capital, energy, ability and risks embodied in the undertaking, to permit a profit greater than mere interest, which could be obtained without effort or hazard.
3. Disregard of attacks by popularity seeking agitators.
4. Willingness to recognize and reward improvements in service.
5. Recognition of the fact that the operation of utilities differs fundamentally from merchandising or manufacturing.
6. Reasonableness in demanding large capital outlays for improvements not strictly necessary to the rendering of adequate service, such as placing wires underground in cities of small size.
7. To make prompt payment of bills.
8. Protection against direct competition. All authorities agree that public utilities can be conducted with greatest benefit to the public as controlled monopolies.
9. Careful consideration of legislation which would hamper and curtail the development of utilities.
10. Recognition of the fact that, starting from a given base line, which varies in different localities, reduction in rates can be obtained without financial loss only by increasing the volume of service sold.
11. Recognition that no utility can well serve a municipality if not in prosperous condition and able to obtain the investment of new capital on favorable terms.
12. Treatment of all questions affecting public utilities in a fair-minded way, looking upon them as business questions without regard to politics.

New England Street Railway Club Entertained at Bangor

The most successful outing in the history of the New England Street Railway Club was held at Bangor, Me., on July 14 and 15, about 150 members being the guests of John R. Graham, president of the Bangor Railway & Electric Company. The main party left Boston on the 13th, and upon arrival at Bangor was conveyed by a reception committee to the Conduskeag Canoe Club, where a chicken breakfast was served. Following an inspection of the local offices and plants of the company special cars were taken to the Graham farm in East Corinth, an electrically operated gravel excavator being examined en route. A Dutch lunch was served at 1 o'clock, and informal addresses were made by Governor Haines of Maine, Col. Frederick H. Parkhurst and Mayor John Q. Utterback of Bangor. Governor Haines referred in glowing terms to the work of Mr. Graham in the Pine Tree State, saying that the host of the occasion is the greatest asset of eastern Maine. Colonel Parkhurst said that Mr. Graham is doing more to build up Bangor than any other man, and the chief executive of that city praised the ability with which the company's lines have been laid out to meet the public convenience, assuring his hearers of his co-operation in relation to further extensions. After the lunch the party enjoyed a baseball game which was won by the "Operators" from the "Supplies." Later in the afternoon races, shot putting, a tug-of-war and other sports were held.

At 5.30 p. m. the party took special cars for Riverside Park, and in addition to the regular performance scheduled at the local theater, a banquet was held, at which Harry B. Ivers, of Boston, Mass., was toastmaster, the speakers being J. E. Dozier, Lynn, Mass.; Mayor Utterback; Hon. J. A. Peters, M. C.; President C. F. Bragg, of the Bangor Chamber of Commerce; C. E. Elwell, consulting engineer of the Connecticut Public Utilities Commission; Gen. Joseph Smith, Bangor; C. M. Stewart, Bangor; C. C. Peirce, Boston, and John T. Conway, president of the New England Street Railway Club. Among the guests were also Governor Haines and Railroad Commissioners F. Kiezer and George F. Giddings of Maine. Great enthusiasm was aroused by the presentation to Mr. Graham by President Conway on behalf of the club of a handsome silver service. In his response, Mr. Graham expressed his appreciation of the gift, and after sketching the development of the electric railway system under his administration, concluded with brief comments upon the car earnings on some of the lines, which, he said, exceeded those on Washington Street, Boston, when figured on a car-hour basis. The speaker said he had had many opportunities to leave Bangor at a greatly increased financial return, but that he had cast in his lot with the city and proposed to remain as long as permitted. On Wednesday morning the party enjoyed a 90-mile automobile ride and boarded the steamer for Boston at Bucksport on the Penobscot River.

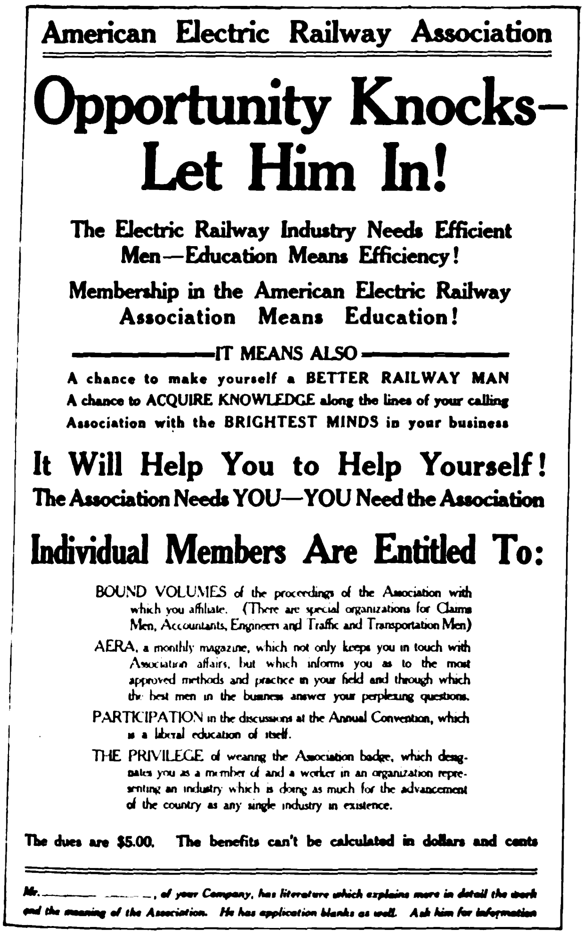
American Association News

Summer Has Not Diminished the Activities in the Several Divisions of Association Work, as is Evidenced by the Notes of Committee Meetings and Developing Plans Printed Below.

CAMPAIGN FOR MEMBERSHIP

Some of the details of the campaign for new members which the American Association has been conducting recently were made public this week through the New York headquarters of the association. The plan is explained in the following letter sent to member companies and signed by L. S. Storrs, chairman of the committee on company sections and individual membership:

"The officers of this association feel that its individual membership is one of its great sources of strength and influence. Every individual that can be impressed with the association's viewpoint in matters affecting the problems of the industry is a force acting towards the creation of better public relations.



American Electric Railway Association

Opportunity Knocks—Let Him In!

The Electric Railway Industry Needs Efficient Men—Education Means Efficiency!

Membership in the American Electric Railway Association Means Education!

—IT MEANS ALSO—

A chance to make yourself a BETTER RAILWAY MAN

A chance to ACQUIRE KNOWLEDGE along the lines of your calling

Association with the BRIGHTEST MINDS in your business

It Will Help You to Help Yourself!

The Association Needs YOU—YOU Need the Association

Individual Members Are Entitled To:

BOUND VOLUMES of the proceedings of the Association with which you affiliate. (There are special organizations for Claims Men, Accountants, Engineers and Traffic and Transportation Men)

AERA, a monthly magazine, which not only keeps you in touch with Association affairs, but which informs you as to the most approved methods and practice in your field and through which the best men in the business answer your perplexing questions.

PARTICIPATION in the discussions at the Annual Convention, which is a liberal education of itself.

THE PRIVILEGE of wearing the Association badge, which designates you as a member of and a worker in an organization representing an industry which is doing as much for the advancement of the country as any single industry in existence.

The dues are $5.00. The benefits can't be calculated in dollars and cents

Mr. ________ ______, of your Company, has literature which explains more in detail the work and the meaning of the Association. He has application blanks as well. Ask him for information

POSTER ISSUED FOR DISTRIBUTION AMONG MEMBER COMPANIES

"Every individual who can be brought under association influence receives an education that increases his value to his company and himself. An increase in individual members means for the association an increase in strength and influence. The association is far behind its sister organization, the National Electric Light Association, in the number of its individual members, and an earnest effort is being made to secure recruits.

"We solicit your assistance in this work, and with that end in view are sending you under separate cover several copies of a poster, which we would ask you to have displayed in conspicuous places so as to reach the men whom you think may be secured as individual members.

"In addition, we would ask you to designate some officer of your company to have charge of the pamphlets and application blanks which we are sending you, and who has sufficient interest in the association to answer such questions as may be asked. The name of such officer should be filled in on the blank space in the poster.

"I feel sure that your realization of the possibilities of association work and the good which is bound to come from an earnest, enthusiastic membership will lead you to assist us in the matter."

The poster to which Mr. Storrs refers is reproduced herewith. It is printed in two colors on a sheet 21 in. x 14 in.

TRANSPORTATION COMMITTEE

The following members of the transportation committee to have charge of special trains to the Atlantic City convention and of getting a good attendance there have been announced by J. K. Choate, master of transportation:

New England: H. E. Reynolds, Boston; H. C. Page, Worcester; M. S. W. Dingwall, Presque Isle; Charles C. Peirce, Boston; C. R. Edwards, Boston; W. A. Farnsworth, Boston; Charles N. Wood, Boston; Warren L. Boyer, Springfield; R. F. Gammons, West Newton.

New York State (exclusive of New York City): James F. Hamilton, Albany; E. J. Dickson, Buffalo; F. H. Hill, Elmira; James B. Strong, Rockland County; Charles R. Robinson, Buffalo; J. A. McIntyre, Albany; W. D. Brewster, Buffalo.

New York City: J. S. Doyle, New York; George Keegan, New York; William Siebert, Brooklyn; J. W. Brown, Newark, N. J.; H. W. Griffin, New York; Roy V. Collins, New York; C. G. Chamberlin, New York; Henry Lee, New York; C. B. Keyes, New York; A. G. Kingman, New York; E. R. Mason, New York; John Baird, New York; W. W. Storms, New York; Arthur Varian, New York.

Philadelphia and vicinity: H. J. Crowley, Philadelphia; J. L. Adams, Upper Darby; R. C. McCloy, Philadelphia; S. J. Cotsworth, Philadelphia; M. Alpern, Philadelphia; H. C. Bayard, Philadelphia; John Dickey, Philadelphia; William B. Goodall, Philadelphia.

Middle Atlantic States (Delaware, Maryland, Virginia and District of Columbia): T. W. Wilson, Wilmington; T. C. Cherry, Annapolis; D. S. Carll, Washington; J. N. Shannahan, Hampton; W. A. Woolford, Baltimore; Robert Burgess, Atlanta; H. H. Seabrook, Baltimore; S. K. Colby, Baltimore.

Central States (Indiana, Ohio, Michigan and western Pennsylvania): Dana Stevens, Cincinnati; G. K. Jeffries, Indianapolis; A. D. B. Van Zandt, Detroit; P. N. Jones, Pittsburgh; A. L. Johnson, Cincinnati; James H. Drew, Indianapolis; L. J. Drake, Indianapolis; D. H. Ackerson, Cincinnati; Ross Forward, Cleveland; W. McKay White, Indianapolis.

Chicago, northern Illinois and Wisconsin: G. T. Seely, Chicago; Leonard A. Busby, Chicago; H. E. Chubbuck, Peoria; R. B. Stearns, Milwaukee; C. N. Wilcoxon, Michigan City; H. J. Kenfield, Chicago; S. P. McGough, Chicago; John Benham, Chicago; L. E.

Gould, Chicago; L. E. Morier, Chicago; B. E. Bushnell, Chicago; Charles D. Jenks, Chicago.

North Central States (northwest Minnesota, North and South Dakota and Iowa): A. M. Robertson, Minneapolis; F. M. Mills, Sioux Falls; Thomas Roycraft, Grand Forks; E. L. Kirk, Sioux City; R. A. Swain, Minneapolis; W. D. McDonald, Minneapolis.

St. Louis and Kansas City and southern Illinois: Bruce Cameron, St. Louis; J. M. Egan, Kansas City; L. C. Haynes, East St. Louis; Scott H. Blewett, St. Louis; O. W. Uthoff, St. Louis; W. K. Norris, St. Louis; E. B. Meissner, St. Louis; E. J. Clark, St. Louis; H. C. Avis, St. Louis.

Southeastern States: Hardy Croom, Jacksonville; R. W. Spofford, Augusta; J. H. Sottile, Charleston; E. H. Ginn, Atlanta; G. H. Thomas, Chattahoochee; A. H. Sisson, High Point.

Southwestern States (Texas, Oklahoma, Arkansas and Louisiana): C. J. Griffith, Little Rock; David Daly, Houston; M. S. Sloan, New Orleans; R. D. Long, Muskogee; B. Willard, New Orleans; A. V. Handcock, Oklahoma City; C. W. Hobson, Dallas.

Western States (Utah, Colorado, Nebraska and Kansas): Simon Bamberger, Ogden; C. B. Wells, Denver; R. A. Leussler, Omaha; William A. Satterlee, Pittsburg; P. A. Hedendahl, Denver; H. C. Glaze, Denver; Wilson A. Austin, Omaha; Melvin D. Wells, Salt Lake City.

California: John A. Britton, San Francisco; A. W. McLimont, Oakland; J. McMillan, Los Angeles; Thomas Finigan, San Francisco; W. E. Amman, San Francisco; A. V. Thompson, San Francisco; H. S. Clark, San Francisco; Philip Dibert, San Francisco.

Northwestern States: F. W. Hild, Portland; George W. Rounds, Tacoma; A. M. Wilson, Portland.

Canada: R. J. Fleming, Toronto; A. Gaboury, Montreal; Acton Burroughs, Toronto; Richard Russell, Toronto.

COMMITTEE ON EDUCATION

The committee on education recently arranged with a well-known correspondence school to outline a set of courses for men in the several branches of electric railway work. Since that time the faculty of the school has been studying the requirements of men in this field and has completed a preliminary draft of the courses. This will be submitted to a sub-committee of the committee on education within a few days, to the entire committee soon thereafter and to the appropriate committees of the engineering association in due course.

The committee on education is also planning to secure a large attendance of representatives of technical schools at the convention with a view to interesting them and promoting a closer relation between them and the industry.

MEETING OF PASSENGER TRAFFIC COMMITTEE

The second and final meeting of the passenger traffic committee of the American Electric Railway Transportation & Traffic Association was held at the Hollenden Hotel, Cleveland, on July 10. Those in attendance were E. E. Soules, Illinois Traction System, Peoria, chairman; C. R. Gowen, New York State Railways; Richard Breckenridge, Aurora, Elgin & Chicago Railroad, and J. A. Greenland, Fort Wayne & Northern Indiana Traction Company.

A considerable part of the report, as already stated in these columns, will deal with the subject of motor buses and the trackless trolley system. The data compiled on this part of the report were gone over in detail by the committee. It will show, among other things, that there are forty-four motor bus companies in operation at the present time in the United States and that many others are contemplated. The committee has been successful in securing data on the cost of operation and the gross and net revenue of some of these lines, and every effort will be made to amplify this information so far as other motor bus companies are concerned before the report is filed for publication. The report will also contain a discussion of the duties and functions of the traffic manager under the following headings: Development of new business; distribution of traffic, especially at times of peak loads, and improvements in public relations.

MANUFACTURERS' ASSOCIATION ACTIVITIES

As a result of a meeting of the executive committee of the American Electric Railway Manufacturers' Association held on July 10, application blanks have been sent out to each manufacturer who has chosen exhibit space for the A. E. R. A. convention at Atlantic City next autumn, showing the official assignment of space for that particular manufacturer, as decided upon by the assignment committee. The committee has given considerable time to the individual applications and has tried to give each exhibitor as nearly what was asked for as conditions would permit. As the association is anxious to fulfil all of its contracts, it asks as a special favor that each exhibitor have the bill inclosed with his application blank passed for payment at once. The exhibit committee also makes a special request that nothing in connection with the exhibit shall be ordered from anyone except on the blanks which it will issue from time to time. H. G. McConnaughy, secretary of the Manufacturers' Association, will be glad to give personal advice to exhibitors who require such. The prospects are unusually good for a large attendance and exhibit, as shown by the fact that more space has been assigned this year than last year up to this time.

The membership committee has been doing good work in enlisting new members for the association. Companies which joined the association during the week ending July 14 are: the Brookfield Glass Company, New York; Independent Pneumatic Tool Company, Chicago; Federal Signal Company, New York; Universal Trolley Wheel Company, Northampton, Mass.; Sattley Manufacturing Company, Detroit, Mich.; Universal Car & Manufacturing Company, New York.

Plans have been considered for the appointment of a finance committee, and the members of this committee will probably be selected within two weeks.

The entertainment committee held its first meeting on July 10, at which tentative entertainment plans for the convention were discussed. The full list of this committee will be made public soon. An attractive program is promised.

An interesting incident of the development of the exhibit arrangement is a message received by Mr. McConnaughy by Marconi wireless from the Electro-Magnetic Brake Company, of London, England. The inquiry is for space and rates, and the method used in sending for information indicates progressiveness and urgent interest on the part of the prospective exhibitor.

The Manhattan City & Interurban Railway, Manhattan, Kan., is deviating from its policy to carry only passengers, and is now hauling wheat in that section. Arrangements have been made by the farmers with officers of the railway whereby the latter will place freight cars at switches along the road. The farmers will do the delivering and loading and the railway will run the loaded cars to Eureka Springs, where connection will be made with the Union Pacific.

COMMUNICATIONS

The Kansas City Franchise

NEW YORK, July 11, 1914.

To the Editors:

The Kansas City street railway settlement franchise, approved at the polls on July 7, easily takes a place with the Chicago settlement ordinances of 1907, the Cleveland settlement of 1910, and the New York subway contracts of 1913, in the novelty of its provisions and in the significance it may have in the development of public policy for the adjustment of the troubled relations between great cities and street railway corporations. Personally I was strongly opposed to the Kansas City franchise as I was to the New York subway contracts, for the reason that in my judgment both settlements carried the guaranty of the private investment to the point of practical certainty without securing to the cities the full measure of concessions which should be given as the price of such guaranties.

There is a general agreement, I believe, among the thoughtful students of public utility problems that the character of public utility investments in the United States should be changed and is being changed from speculative to non-speculative. I have gone so far as to say that it is almost as much of a disgrace to a city to have its public service corporations in receivers' hands as it would be for the city to default on its own bonds. For some years I have been advocating the theory that public utility investments should approximate municipal bonds in safety. I have done this as a conservative but firm believer in ultimate municipal ownership of street utilities, as well as from a recognition of the fundamental public importance of efficient and adequate service continuously rendered by modern and highly-maintained public utility plants. I even go so far as to say that cities ought to assume for the future the ultimate risk of public utility investments in so far as such risk is due to the possibility of existing structures becoming obsolete through the development of the arts and changes in the conditions of the service. Of course, I maintain that in return for making the investment safe and the annual interest payments and the ultimate return of the principal certain, the city ought to get very important advantages. From the standpoint of the cost of capital, these advantages ought to approximate the advantages of municipal ownership.

The street railway interests eagerly embrace the doctrine of a safe investment and of a guaranteed return upon it, but the safer the investment and the surer the annual return, the less they are inclined to favor the ultimate withdrawal of their capital through the process of amortization or otherwise. They are glad to accept the advantages of the proposed program but are loath to pay the price that may be reasonably expected of them. The companies balk at two points.

In the first place, the existing investment has to be measured and recognized as a sort of financial base or starting point for the readjusted financial relations of the future. The companies, even when operating under limited franchises, and even though their investments when made were highly speculative in character, seek to have included in the valuation of their existing property all of the money which may have been put in during the past, even though some of it was lost long ago. In other words, they take the position that in making a new deal the city should assume past risks as well as future risks, and include lost investments in one form or another in recognized capital value. On the other hand, if the enterprise has been profitable, that fact is not admitted to be a reason for assuming that the money invested in superseded property has been withdrawn from capital account, but rather is put forward as a reason for a further swelling of the recognized investment. Whether they have won or lost under the speculative conditions of the past, they ask the city to pay for it.

In the second place, the companies are generally unwilling to accept a rate of return hammered down to the point that the security of the investment will warrant. They cling to an element of speculation. They fail to distinguish between the return which capital as such demands on a safe investment from the speculative profits of promoters and reorganizers and from the profit-sharing regarded as necessary to induce men, not as investors, but as administrators, to do their best in the management of the property and the operation of the business.

It is at these two points that the greatest struggle inevitably comes in a readjustment of franchise relations like that which has been going on in Kansas City during the past two or three years. At these points there is a sheer conflict of interests, and how the respective parties fare will depend upon how well they are represented in the bargaining. It seems to me that in the final settlement of the Kansas City difficulties the company drove so hard a bargain and so successfully outmaneuvered the city as to make the contract distinctly disadvantageous from the public point of view.

The chief reasons why I believe that the Kansas City settlement is an improvident contract from the city's standpoint are the following:

1. The recognized capital value is too large, as it makes good the company's past losses. While the $30,000,000 valuation agreed upon does not cover nominally the entire amount of superseded and lost investments, or the entire amount of the speculative value of the unexpired portion of the life of the old franchise, the allowance of a 6 per cent preferential return instead of 5 per cent, as allowed in Chicago, makes the gross value of the securities to be issued substantially $36,000,000, as against a present physical value of about $23,000,000. What was left out in fixing the nominal valuation was put into the rate of return and the company's right of participation in the profits.

2. The forfeiture clause is a joke. It provides for pensioning the company at three-quarters salary as a result of wilful violation of contract proved in court and then persisted in, although the entire capital value, whether represented by stocks or bonds, and the 6 per cent preferential thereon, are left untouched by the forfeiture.

3. The extension clauses are totally inadequate. The minimum requirement, in regard to which the city is given authority to act, is less than the company would naturally build of its own volition if the city grows as is expected, and on other extensions by the company the impossible condition is imposed that they must be foreseen by the Board of Control to be fully self-supporting as extensions, paying full expenses of operation plus 6 per cent on cost. This is a wrong principle as to extensions, and if the city grows as rapidly as is anticipated, this franchise is bound to leave the city as powerless as it is now to secure adequate extensions from the company.

4. The system of dual control provided is without precedent and violates every principle of efficient business management. Either the city's share in the control will be a mere pretense or else the scheme will lead to perpetual wrangles and inefficiency. The provision for calling in an arbiter to settle disputes is not properly worked out, and is altogether too cumbersome as a means of settling an infinite succession of differences,

including both petty and important differences. This applies specifically to the Board of Control. The scheme for minority city directors on the company's board is crude and illogical. These directors are only remotely responsible to the city, as they are to be named by judges whose constituency extends to more than one-third of the State of Missouri with a population of which only one-fifth is in Kansas City. This joint directorate scheme overlooks almost entirely the permanent and inevitable antagonism of interest between the city and the company. The scheme destroys even the theory of public control and turns the whole business into a partnership for profit.

5. The franchise violates one of the most fundamental rules of law, accounting and public morality in making personal injury claims subordinate to the payment of a cumulative 6 per cent return on capital value. That the cost of accidents should be separated from operating expenses and put after capital charges in the disposition of the gross earnings is atrocious.

6. The franchise provides for the gradual inflation of capital value in connection with renewals to the extent of the present accrued depreciation of the property. As appraised by Mr. Arnold, the property was found to be about 79 per cent as good as new. Everybody knows that diligent maintenance and prompt renewals of worn-out or obsolete parts will never bring the property as a whole much, if any, above this average. And so, if 21 per cent of the replacement value of the renewed plant, substituted piecemeal for the depreciated plant with the result merely of maintaining present depreciated values, is added to capital account, it will represent the injection of just so much more water into capital value.

7. The franchise, while holding out the promise of municipal ownership, confuses the issue by dangling the bait of lower fares before the people's eyes. Upon analysis it is found that the utmost reduction of fares possible under the terms of the ordinance, assuming that the estimates agreed upon by the engineers prove to be correct, is a bare ½ cent off the 5-cent fare, and the effect of even that reduction would be to stop the process of amortization and thus prolong the company's right of participation, thereby adding millions of dollars to the purchase price of the property in case the city should desire to take it over the very next day after fares have been reduced.

8. The city was not in a position where it was necessary to settle on unfavorable terms. The old franchise still had eleven years to run and was in general satisfactory to the city. Though certain extensions were needed, the system as a whole was overbuilt, according to Mr. Arnold, and still a moderate amount of extensions could be demanded each year under the old contract. The street car controversy was nothing but an insistence on the company's part that the city should pull the company's financial chestnuts out of the fire. The company practically refused to live up to its franchise contracts, saying that it was financially unable to do so.

The new Kansas City franchise is complex, without being carefully worked out in detail. It is experimental to the point of being chimerical. It is full of lapses from sound reason and just bargaining, which, whether intentional or not, have the effect of "jokers" against the city's interest. It is vague and apparently inconsistent in some of its important provisions. It is a theoretical hodge-podge through which runs only a single thread of certainty, namely, the assumption by the city of the company's past losses and the guaranty by the city that the investors shall not lose in the future. Excellent things for the company—and how cheap they proved to be! DELOS F. WILCOX.

The A. S. T. M. Axle-Steel Specifications

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION

WASHINGTON, D. C., July 13, 1914.

To the Editors:

The minority report of the representatives of the American Electric Railway Engineering Association in committee A-1 of the American Society for Testing Materials, quoted on page 75 of your issue of July 11, states very completely the attitude of that association toward the proposed revision of the "standard specifications for steel forgings for heat-treated axles, shafts and similar objects." This report gives our association's objections to the proposed changes in physical requirements of heat-treated motor-car axles and needs no amplifications, particularly as the discussion has brought out no conclusive reply to their arguments. The statement that the existing standard specifications are not practicable from a manufacturing standpoint is not borne out by the fact that these specifications have been actually in use by a number of purchasers for several years.

The principal objection of the A. E. R. E. A. to the action of the A. S. T. M. is that the latter practically ignored our association's representatives in the consideration of this matter. The A. S. T. M. is an association composed of both manufacturers and consumers. In so far as the specifications in question refer to electric motor-car axles our representatives were the only consumers' representatives on the sub-committee, and any revision of a specification for motor-car axles made against their protest seems to us inconsistent. Our representative's motion to so amend the title of the proposed revised specification that motor-car axles and armature shafts would not be included, gave the committee an opportunity to have the proposed change apply to all parts in which other consumers were interested, but this motion was lost. Moreover, these particular specifications were drawn and proposed by the A. E. R. E. A. and adopted after two years' deliberation, which included consideration by a joint committee of our association and the A. S. T. M.

The A. E. R. E. A. has always recognized the great value of co-operative work with the manufacturers' and with other associations which might be interested in any particular work its committees had under way, and it has accomplished much useful work of this character. Our rules for the adoption of standards and recommendations provide, among other things, that the manufacturing and commercial interests involved must be taken into consideration and this principle has been followed invariably. The action of the A. S. T. M. in revising, against our protest, a specification covering material used almost exclusively by electric railways, which had been jointly considered and approved and which had been in satisfactory use for several years, must unquestionably retard any co-operative work between the two societies and probably makes necessary a change in our methods of procedure in connection with such work. J. H. HANNA, President.

Frank Hedley, vice-president of the Interborough Rapid Transit Company, New York, has written in response to a request from Charities Commissioner Kingsbury of New York to offer free transportation during the summer to and from Van Cortlandt Park to the women, and to children under fourteen years of age, of such charitable organizations as are recognized by the department of charities. This privilege will be granted on Tuesdays, Wednesdays, Thursdays and Fridays, but not on holidays.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Load Dispatching System of the Columbus Railway, Power & Light Company

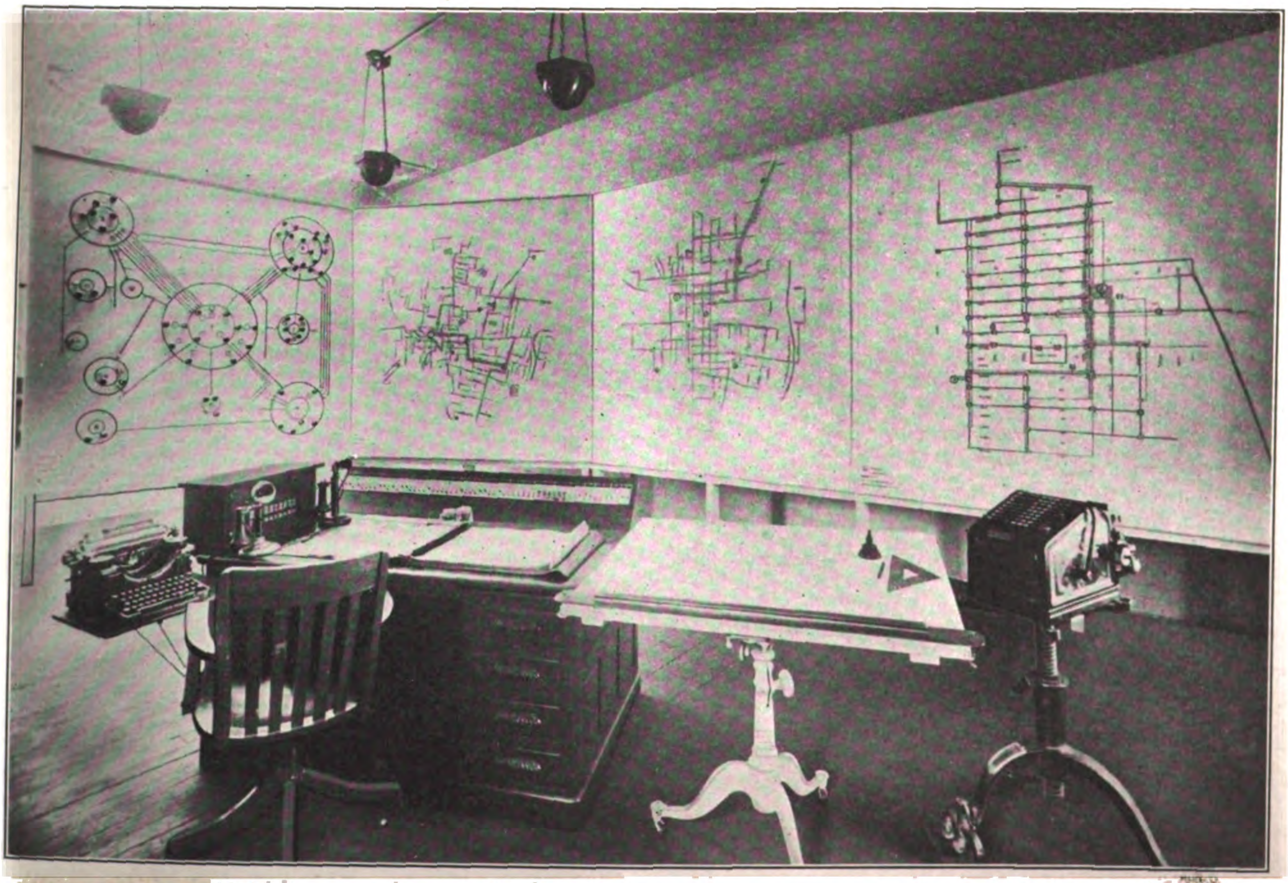
BY HAROLD W. CLAPP, GENERAL SUPERINTENDENT COLUMBUS RAILWAY, POWER & LIGHT COMPANY

The electric energy for operation of the railway system and for supplying the numerous power and light customers of the Columbus Railway, Power & Light Company, is furnished by a system of six power stations, ranging in size from 250 kw to 14,350 kw rated capacity. Current for the railway is generated at 575 volts, and for power and light at 4150 volts, while some direct current is furnished at 220 volts on the Edison three-wire system for lighting the central district of the city. The Spring Street station is the largest and contains four a.c. turbo-generators rated at 11,000 kw and four engine-driven d.c. units rated at 3350 kw. The second largest station has four 220-volt d.c. engine-driven units with a total rating of 2560 kw. The next station in size contains one turbine-driven and three engine-driven alternators, with a total rating of 2100 kw. Located at these stations are seven motor-generator sets varying in size from 300 kw to 750 kw capacity; while six other motor-generator sets and four rotary converters are located at points on the system convenient for proper distribution of energy. The other three stations are very small and are seldom used except in periods of very heavy loads in the winter season or in case of serious breakdown in the larger stations.

All the power stations and substations are tied together by transmission lines, both high and low tension, in such a manner as to make an outage on the lines for more than a very few minutes an unknown thing under all ordinary conditions.

The Spring Street station, containing the largest units, is the most economical to operate, and the rule is followed of carrying all the load possible on this one station. At times, on Sundays and during the latter part of the night, for instance, the load decreases to such a point that it is possible to cut out the prime movers in the second largest—the 220-volt—station and carry its load on its motor-generators from the alternators at the Spring Street station. The load formerly carried by the third largest station, which is also used in winter as a water-heating plant, is handled during the summer season by Spring Street.

Owing to the fact that the generating equipment was so widely scattered, and that the nature of the service required was so exacting, it was deemed advisable to place the responsibility for its proper handling in the hands of a load dispatcher. Consequently, a load dis-



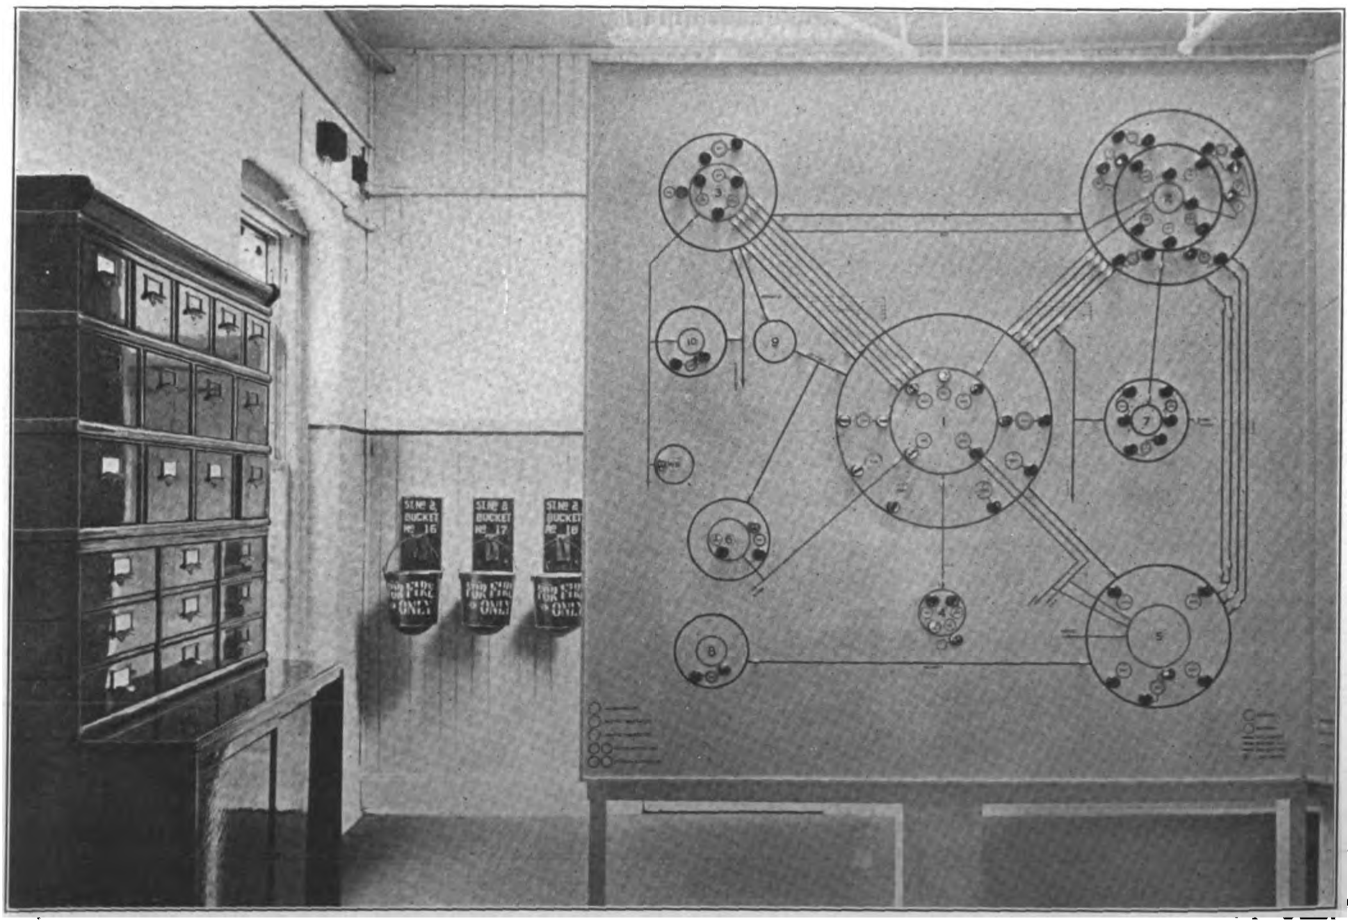
VIEW OF GRAPHIC POWER SYSTEM LAYOUT AND OTHER EQUIPMENT IN LOAD DISPATCHER'S OFFICE OF THE COLUMBUS RAILWAY, POWER & LIGHT COMPANY patching system was recently placed in operation which, it is firmly believed, will result in an increased reliability and the production of further economies in general power station load handling over the old methods. An office adjacent to the second largest station was fitted up with maps, telephones, recording barograph, recording electrical instruments and other necessary equipment for the dispatchers to supervise the load dispatching properly and from which to make out detailed daily reports covering their operations. They are kept advised from time to time through the day, by each station, of the amount of load carried and are given a daily report of the generators in service and their current output, from which the load curve for the day is made. Typewritten reports up to 6 a. m. must be in the hands of the superintendent of power by 9.30 a. m. The practice is followed of noting cases of trouble and fire alarms, received over private line, on these reports in red. This office is also supplied with daily and monthly forecasts of the weather conditions. Wireless antennæ are now being installed to give advice of approaching thunder storms.

A separate telephone system connects the dispatchers direct with all power stations and all substations except two, the latter being reached through the general office operator. The telephone system is so arranged that the load dispatcher may hold a telephone conference with the switchboard operators at all stations. This has already proved a very valuable adjunct as a time saver in connection with certain phases of daily procedure in the handling of the dispatching system.

The three load dispatchers, who work on eight-hour shifts, are switchboard operators of about ten years' experience. They have received several months of additional preparation for this work by being transferred from station to station in order to become familiar with the load conditions of each.

The view of the load dispatcher's office shows at the left a graphic outline of the power station and substation system, giving the manner in which stations are tied together. The next three boards give maps of the city, showing the distributing lines, both railway and power and light. With this information visibly at hand on the boards, the load dispatcher keeps directly in touch with the changes made at the different stations. In case of trouble on any of the lines, his maps indicate at once how he can get around such difficulties with the use of certain line switches and still make it possible to furnish current with the least possible interruption of service.

The No. 1 board shows the power generating system, each power station and substation being indicated by a large circle. The different tie lines between stations are indicated by lines drawn upon the board in the proper color, and line switches are shown by small spring buttons, which can be turned as occasion demands to indicate whether the line is in or out of service. There are sufficient tie lines between stations so that in case of trouble on any line service may still be furnished by using another line. Within the large circle and indicated by smaller circles, are shown each of the generators, motor-generators, rotaries, boosters or batteries in that station. Close to these smaller circles are placed lamps under different colored lenses, the colors indicating the class of current delivered. Railway current, for instance, is shown by a green lens, and alternating current for power and light by a red lens, other colors being used to show rotaries, boosters, etc. At the outer edge of the dispatcher's desk is placed a double row of push button switches which are connected to the lamps on the board; when he orders a certain generator placed on the line, he simply touches the proper button in the bottom row for that machine and its lamp is lighted. When this machine is cut out of service, he presses the top button and the light



GRAPHIC OUTLINE OF COLUMBUS POWER AND SUBSTATION SYSTEM is put out; the lighted lamps giving the number of machines in service and the kind of current each is delivering.

The second board shows the a.c. system, giving the station-to-station tie lines and all primary lines, whether one, two or three phase; no secondary lines are shown. The power stations, substations and the largest consumers are also located on this board. This board is used for following up troubles which may arise from time to time and gives the dispatcher a graphic outline of the means which have been provided to supply current at such cases.

The line department is required to co-operate fully with the dispatchers in handling cases of trouble arising from storms or otherwise, and must also work in conjunction with them in the proper handling of current while new installations are being made. The load dispatching system has proved its worth several times this summer during lightning and wind storms, for the reason that it has brought the dispatchers and line department closely in touch with each other.

The No. 3 board outlines the trolley and feeder system, showing in one color the railway feeders and in another color the double and single trolley lines. This board also locates section insulators, and is intended to be used in case of trouble on the lines, helping the dispatcher at such times to devise a method of supplying current sufficient to operate the cars.

The No. 4 board shows the underground system in the central district of the city. All manholes and junction boxes are located, while the underground and overhead feeders and distributing lines are shown by lines.

A great many calculations are made with the Burroughs adding machine shown in one of the views. Seven more of these machines are used in other departments, some of them being equipped with special features other than for straight addition.

Before the load dispatching system was placed in operation, the heavy peaks in the load were handled by the running engineers at the different stations as each saw fit, subject at times to the approval of the superintendent of power, advice of changes made being given from one to another by telephone. In emergencies, or in cases of breakdown especially, this system has often proved ineffective, occasionally resulting in confusion at a time when machines should have been replaced on the line promptly. This has now been avoided by making one man, the load dispatcher, responsible for getting the machines on or off the line. The load dispatcher knows the steam consumption of each of the steam units, and in most cases he can so order the plan of operation that certain units may be used in preference to those which otherwise might be operated at a greater expense. The great economy resulting from the use of the load dispatching system comes from this fact—the dispatcher can formulate in advance methods of handling the average daily load, using at all times possible those machines which are the most economical in steam consumption. In times of trouble the experience which he accumulates from day to day in handling the system makes his movements decisive and rapid, the whole tending toward a non-interruption of service plus economical generation of energy—"Never-Failing Service" being the final goal to be attained.

Plans have practically been completed for constructing an electric railway from Riga to Assern, a summer resort on the Gulf of Riga. The new line will be 19 miles in length. It will probably be built and operated under the same management as the Riga Street Railways (Aktien-Gesellschaft der Rigaer Strassenbahnen, Alexanderstrasse 171, Riga, Russia.)

Peculiar Derailments in Street Railway Special Work

BY R. P. WILLIAMS, INSPECTOR OF SPECIAL WORK BROOKLYN RAPID TRANSIT SYSTEM

The cause of every derailment should be traced and determined. Common safety demands this, but it is by no means easy always to determine the cause. Too often the record of a derailment reads: "Car No. —— derailed at —— (location). Trucks examined found O. K. Track examined: Gage and line O. K.," or, "Switches examined, found good to gage and line; cause of derailment unknown." This is the beginning of a dangerous element, and no one knows what bad results may follow.

Switch splitting, the most dangerous form of derailment, has been overcome in a large measure by the use of the "anti-straddler," but instances occur when switches equipped with the best of these devices are split. Suppose a mate is wide gage at the "toe." In this case the car wheel on straight run enters the mate groove, bearing heavily against the guard side of the same. Now as the tongue directly opposite this point is usually higher than the curve rail, the wheel will sometimes grip the tongue and pull it toward the mate, thus allowing the following truck or even the rear wheel of the same truck to enter the curve. A narrow gage wheel will often produce a split in the same manner. The cause here is easily determined by making a thorough examination of the truck and the gage of the switch.

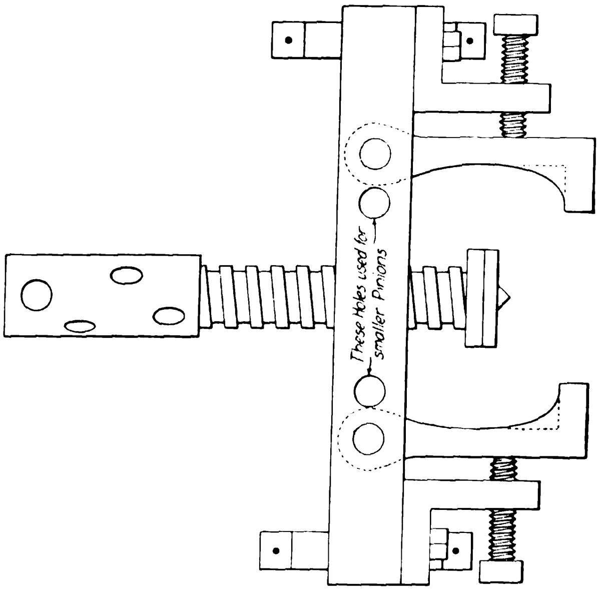
An interesting case occurred at one of our busiest points where traffic conditions are such that cars must keep moving regardless of the position of the other car, and where only extreme watchfulness prevents accident in case of derailment. Derailments (by splitting of the switch) were at first confined to one car. While this car was found in perfect condition, it was transferred to another line. The switch though quite worn was still capable of good service, and the gage at the heel and point was perfect. Trouble began again with another car of the same series. An examination showed the wheels to be new and in perfect gage. It was then thought that since the surface wear caused high guards on the switch, the filling of all the guard room in the switch and mate by the new wheels would cause enough side pull to open the tongue. Accordingly the guards were ground to normal height. As the derailments still continued, a fine line was drawn from the point to the heel of the mate. This showed that while the toe and heel of the mate were in perfect gage, the heel of the mate plate was almost ¼ in. wide gage. Although the groove at the mate point was full width according to standard, a measurement from the fine line to the guard side only showed 1 in., thus giving the same effect as though the mate was wide gage. The guard side of the mate groove was then ground and the derailments ceased.

Another case was that of a maximum traction truck with the pony wheels leading. All manner of investigation showed the existence of proper conditions. It was observed, however, that the derailments occurred about the same time every day. A watch was set, and we found that under a very heavy load the car body would sag sufficiently to allow a bolt projecting from a platform beam to strike the truck frame just as the wheel was taking the switch. When after a second derailment at a certain location an examination shows no cause for the trouble, the transfer of the car to another line makes it very hard to locate the cause of isolated cases. A good slogan for the careful operator of electric railways would be: Find the cause of the derailment at all costs.

Home-Made Pinion Pullers of Adjustable and Non-Adjustable Type

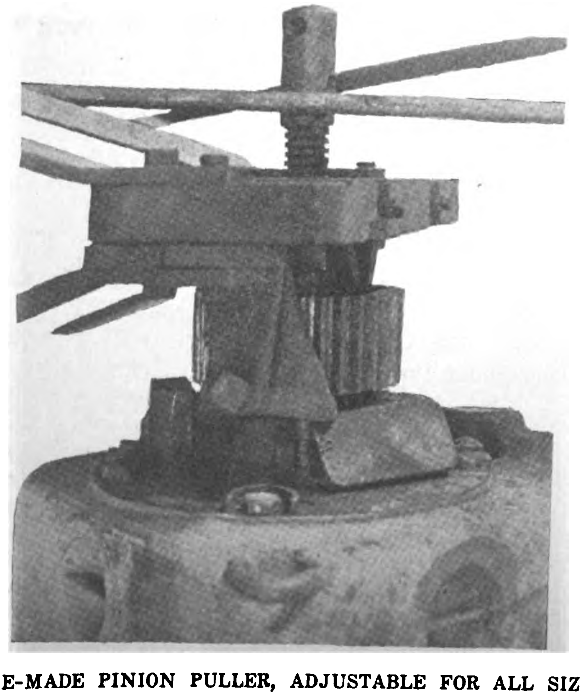
BY F. J. FOOTE, MASTER MECHANIC THE OHIO ELECTRIC RAILWAY

Among the home-made devices in our Columbus shops are two types of pinion pullers. One halftone shows our adjustable puller as used to pull a pinion off of a GE-73 motor shaft, while the drawing shows a rough outline of the device. The puller is fastened firmly to the floor at some point where it can be conveniently reached by a crane. The screw is heavy and is provided with a swivel point. The jaws of this puller are adjustable so that pinions of various sizes can be pulled off simply by pulling the pins that hold the jaws to the yoke. The jaws can be removed to place them in closer to the screw; the jaws are then in position to pull smaller pinions.

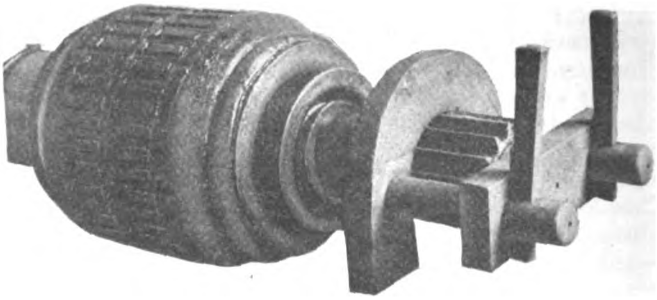


ADJUSTABLE PINION PULLER

A much simpler pinion puller also used by us is shown in the second half-tone. This consists of a heavy steel horseshoe with studs and a pulling yoke and keys. This puller has the advantage of simplicity, but the disadvantage that it can be used only for one size of pinions. However, on city lines where many cars have the same-sized motors and pinions, this style will pay for itself in a short time. Both of these pinion pullers are in successful use at our shops.



HOME-MADE PINION PULLER, ADJUSTABLE FOR ALL SIZES OF PINIONS



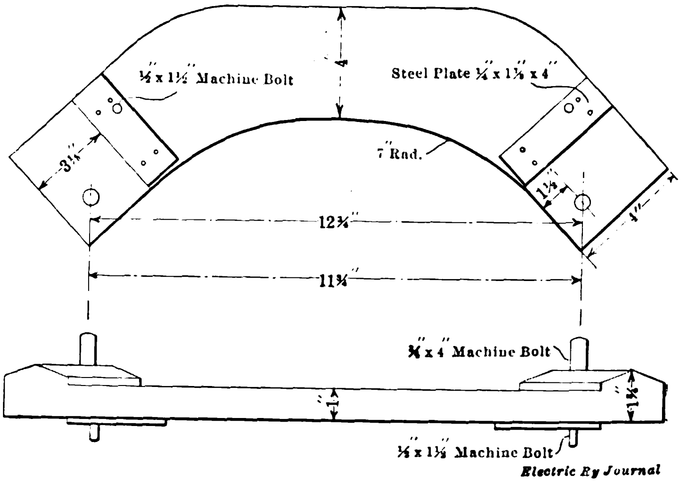
SIMPLIFIED PINION PULLER, BUT GOOD FOR ONLY ONE SIZE OF PINION

Brush-Holder Yoke for Westinghouse No. 49 Motor

BY J. N. GRAHAM, SHOP FOREMAN ROCKFORD & INTERURBAN RAILWAY

A home-made brush-holder yoke, which eliminates most of the brush-holder troubles on the Westinghouse No. 49 motor, has been in use on the Rockford & Interurban Railway's lines for several years with very good results.

The yoke is made of hard maple and is made to fit into the lead seats in the motor frame which are provided for the brush-holders. It is held in place by two ¾-in. x 4-in. machine bolts, the heads of which are cut to ¼ in. in thickness and sunk into the wood for ⅜ in. and covered with ⅛-in. x 2-in. fiber disks sunk level with the face of the yoke. Two plates of cold-rolled steel ¼ in. x 1⅞ in. x 4 in. are riveted to the face of the yoke in the position shown in the illustration. These plates have ½-in. x 1½-in. machine bolts through them to hold the brush-holders in position. The type of brush-holder is either the GE 52 or the GE 1000.



YOKE FOR BRUSH-HOLDER OF NO. 49 MOTOR

In making the yokes great care must be taken to get the plates at perfect right angles; also that they as well as the bolts, which hold the yoke in position, are at an equal distance from the center of the yoke. This will insure that the brushes assume the proper position on the commutator.

Types of Track at Richmond, Va.

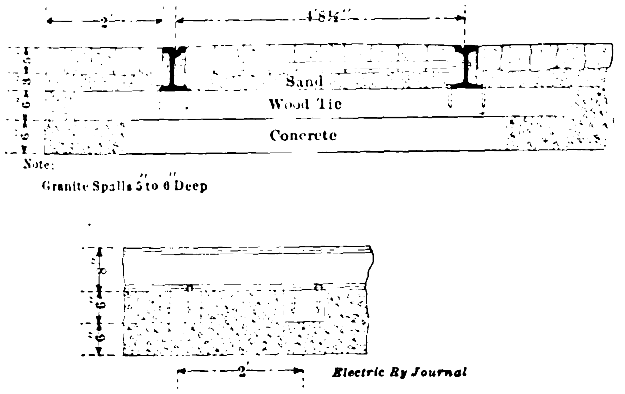
BY T. NORMAN JONES, CHIEF ENGINEER OF RAILWAYS VIRGINIA RAILWAY & POWER COMPANY

In the June 6 issue of the ELECTRIC RAILWAY JOURNAL there appeared an article by A. L. Johnston, Jr., relative to the life of concrete track on Broad Street, Richmond, Va. I should have written before for the benefit of your readers the result of our experience with this track, that those who read the article might be informed of all the facts, but pressure of work has prevented my doing so.

The track in question was constructed in 1896 with white oak ties on concrete foundation. The concrete extended up between and at the ends of ties to the top of same. The rail used weighed 95 lb. to the yard, and was 8 in. high.

We have about completed the reconstruction of approximately 5000 ft. of track constructed as above noted. Our experience with concrete track foundation has been most unsatisfactory, and the type of construction referred to above has been abandoned in Richmond.

While our records are not complete as to the dates on which the early repairs to this track were made, my investigation made about two years ago satisfied me that the first serious trouble with this track developed in 1903, about seven years after the track was laid. At that time it was found necessary to make extensive repairs at the rail joints, including renewal of some of the bonds (from 1903 to 1908 it was frequently found necessary to renew rail bonds, and in 1909 a very large portion of the bonds had to be renewed) as well as to place shims of steel and wood between the base of the rail and tie, due to the failure of the concrete foundation, although it extended 6 in. below the base of the ties. The repairs to the track grew heavier from year to year, until in 1912 the cost of maintaining about 8000 ft. of this track was about three times that of maintaining a similar length of track laid the same year on a parallel street on earth foundation without any ballast worth naming, yet the earth-supported track was subjected to traffic of very nearly the same density as the track on Broad Street.



EARLY RICHMOND TRACK ON CONCRETE FOUNDATION

I have made a careful study of this track and many other sections of track in Richmond constructed during different years on concrete and other types of foundation. During the spring of 1912 I recommended that the concrete track construction be abandoned and that the tracks in future be constructed with white oak ties on crushed stone foundation, with a concrete slab between and at the ends of the ties to support the paving. The City Council granted us permission in 1912 to change our type of track construction from concrete to crushed stone foundation. This change in type of construction was confirmed by the Administrative Board last year shortly after its organization.

Throughout the entire 5000 ft. of single track, the reconstruction of which has been about completed, we have found the concrete foundation between and below the ties broken beneath both rails. The removal of the concrete base was tedious, as the concrete had to be broken to a convenient size for handling, but the work was not difficult as the foundation was badly cracked throughout. Very few of the old rails were not corrugated and many of them were corrugated very badly.

PRESENT TRACK ON CRUSHED STONE FOUNDATION

For many years past much trouble has been experienced with this track following rainy spells and the melting of snow water would get down in the foundation through the cracked concrete under the rails, causing the concrete to work up and down under traffic. This trouble existed all along most of the rails and was not confined to joints only. Heaving, the result of freezing of the partly water-soaked foundation, was another source of trouble.

Our standard type of track construction, as illustrated, consists of crushed stone or washed gravel ballast on which rest white oak cross-ties, to which 7-in. rail is fastened. The rail section used is Lorain 116/434. Cut spikes are used in fastening the rails to the ties. A concrete paving slab (1:3:5 mixture) is placed between and at the ends of ties to support the paving.

Use of Battery Push-Button Circuit for Tail Lights

BY A MISSOURI CONTRIBUTOR

My attention has been called to a number of rear-end collisions on dark streets and alleys when the trolley wheel came off and left the car in darkness. One accident that I have in mind is where the conductor was on top of the car tying the trolley rope. There were two serious and several minor injuries because of the resulting rear-end crash. Some companies that run in the suburbs have dangerous curves with dead trolley wires therein as a warning to the motorman to slow up.

Suppose that for some unforeseen cause a car should stop in the darkness with no danger lights on the rear end. The chances are that somebody would be hurt and the car would be damaged.

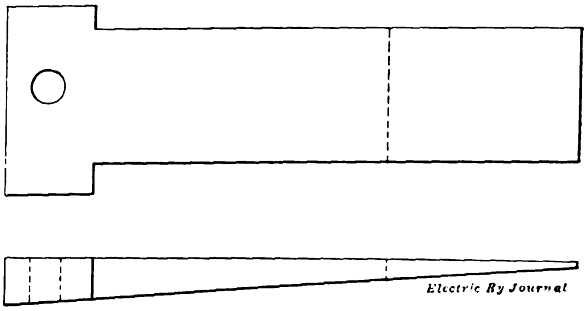
I wish to suggest a "danger signal" which would cost little, because the batteries of the passengers' push-button signal circuit would be utilized for the purpose. If four batteries are used for push buttons an 8-volt, 2-cp lamp can be used on the circuit, or some other lamp according to the number of batteries. The lamp should shine behind a pane of red glass or have a red bulb. The lamp switch should be in front of the motorman. As soon as the trolley pole comes off the motorman could cut in the switch, but as soon as the trolley pole was adjusted he could open it. A car could be equipped for less than $1. It is understood that this scheme is not intended for use when power is off on the whole division.

Hints On and Costs Of Motor Maintenance—II

BY R. H. PARSONS, ELECTRICAL FOREMAN

For a shop overhauling, the old motor should be removed from the trucks, opened and the armature removed. If the motor has once been put into good condition and has had proper carhouse care, it should not be necessary to remove the fields, providing they are tight in the shell and not baked or short-circuited. Fields in good condition, properly installed and not overloaded, should run four or five years before the insulation is baked enough to warrant their removal and reinsulation.

After the armature is removed the brush-holder should be removed for overhauling and the fields tested for short-circuits and grounds. The armature should be inspected and tested and refitted with bearings. In the meantime the shell should be scraped and blown out and treated with a good insulating paint. The dowel pins should also be tightened or renewed, the oil receptacles cleaned and the brush-holder supports inspected or renewed if necessary.



FIBER WEDGE FOR GAGING BRUSH-HOLDERS

While the shell is being overhauled, the armature should be tested for short or open circuits and grounds. This can be done best by passing a small current through the coils, and taking the drop between each bar with a millivoltmeter to detect any loose connections or short-circuits. The shaft should be examined to see if it is straight and smooth. The commutator bars should be tried to see if they are tight. Then the commutator should be turned and the mica undercut. Upon this the armature should be painted, a good oilproof varnish being used for the string band, and the shafts should be refitted with bearings.

While the undercutting of mica is a decided aid to good commutation, improper slotting is worse than none at all. Saws or slotting tools of the proper thickness to the thousandth of an inch should be used to make sure that every particle of mica is removed, for a little strip in the edge of the slot will cause jumping of the brushes and soon develop flat spots in the commutator.

Cut-out leads of armatures should not be allowed. It is the custom of many roads to cut out a grounded or open-circuited lead, using a jumper in its place and then turning the armature out for service. This practice simply adds trouble, for if it is done once it will be done again. Frequently armatures are found with a large number of the leads cut out. This is not economical practice because the added current due to lowering the resistance of the armature causes greater heating in the motor, for then the jumpered motor endeavors to do more work than its mate. Eventually the fields are roasted and the armature must be rewound. If the defective coil had been renewed or repaired when the armature first came in for trouble, the armature would have gone out practically as good as new and the motor would have taken only its proper share of the load. When a road has to go into receivership, the armatures are usually found full of jumpers. Jumpered armatures and receiverships are not necessarily Siamese twins, but the fact remains that they are often found together.

Before assembling the motor the surfaces of the shell should be thoroughly cleaned, and when the shell is tightened onto the bearings the armature should move easily enough to be turned by hand. At the same time the bearings must be tight enough in the housings to prevent the leakage of oil.

The setting of the brush-holders is as important a task as any. The man who does this must see that the brush-holders have the proper lateral position on the commutator to prevent the brushes from making a ridge; also, that they are so set that the brushes will rest squarely on the bars and that the spacing is correct for the motor in question. The tension should be adjusted, and the correct height from the bars be followed. For gaging the height of the brush-holders, a fiber wedge similar to that shown in an accompanying sketch will be found useful. This wedge can be made with a mark to show what point on it will give the clearance desired. This clearance usually is 3/16 in. Place the wedge on the commutator, set the brush-holder in position and drop it until it hits the wedge at the place marked. Then tighten the brush-holder and remove the wedge. Sometimes a man will use a screwdriver or a rule for this purpose but the wedge will be found correct and simple. Further, it will save a man from trying to hold the brush-holder to proper height with one hand and tightening it with the other. The wedge is also used to check the gage of the brush-holder when it is not necessary to remove it, and as it is of fiber it will not cut the commutator.

When brushes are placed in the holders, the advantages which are derived from fitting the brushes to the curve of the commutator by drawing a piece of sandpaper under the brush, with the brush in place and held down by the spring or hand, greatly offset the labor of doing so. While the commutator is running at a moderately high speed it should be smoothed by holding a piece of fine sandpaper on it. Then the brushes are fitted and also cleaned on the wearing surface after the sandpapering of the commutator is completed to prevent particles of copper from adhering to the brush and cutting the commutator. Finally, the motor is given a light running test to try out the bearings for heating and for commutation. It is not necessary to give each motor a load test, as one familiar with each type can quickly detect any defect by the light running test, especially since the fields and armature have been individually tested.

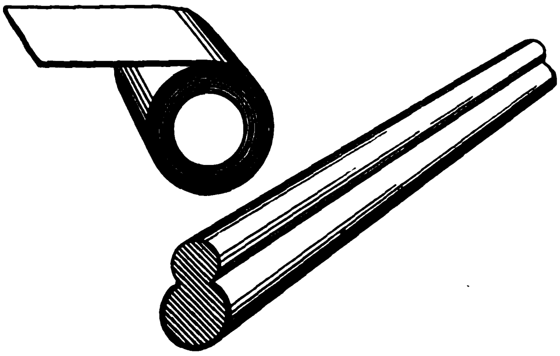
MODERN MOTORS

The maintenance and repairs of modern motors, while following the old procedure in many respects, is much easier and cheaper. It is not necessary to check the armature clearance except on a weekly inspection, nor is it necessary to oil the motors on short periods for many of them will go thirty days without replenishment. The repairs can be made more easily because the parts are more uniform and interchangeable. As the shafts are large in proportion to the armature, the bearings often will run five years, or 250,000 miles, before rebabbitting. Further, as the commutation is good the brushes will frequently last nearly as long. These improvements simplify the shop repairs to such an extent that a motor removed from the track and placed on the floor can often be passed without any repairs whatsoever after an inspection has shown its bearings to be safe for another overhauling period. In that event the brush-holders should be removed and cleaned, the fields tried for looseness and the armature and fields tested for grounds. From the appearance of the commutator it can be determined if the fields and armature are free from short-circuits, as this trouble is quickly reflected in the commutator. The slots should be cleaned by drawing a broken hack-saw blade, using the back side as the scraper, through the slot. Any little burrs should be removed from the commutator with a fine file, the hood and string band painted with an oilproof varnish, and the brush-holders and carbons replaced. The leads should then be inspected and painted. After the usual running test, the motor is again ready for service.

A Removable Conducting Jacket for Trolley Wire and Other Conductors

Louis Steinberger, president Electrose Manufacturing Company, Brooklyn, N. Y., who is well known for his inventions in the insulator field, has just secured a patent on what he terms a "flexible electric conductor," which is adapted more particularly to the trolley conductors of railways. In brief, the invention is intended to combine the high conductivity of, say, a copper jacket with the great strength of the steel around which it is wrapped. The conductor as a whole, therefore, comprises a longitudinal supporting member and a removable ribbon of metal with a low ohmic resistance and provided with a suitable contact surface.

The ribbon may be applied to the supporting wire when the latter is manufactured, or may be placed in position upon it at any time after the wire is suspended; moreover, the ribbon may be cut into any convenient lengths. A worn portion of the ribbon may be readily replaced at low cost. The ribbon carrying the contact face may be applied to compensate for the difference in the co-efficients of expansion or contraction between the body portion of the conductor and the ribbon.



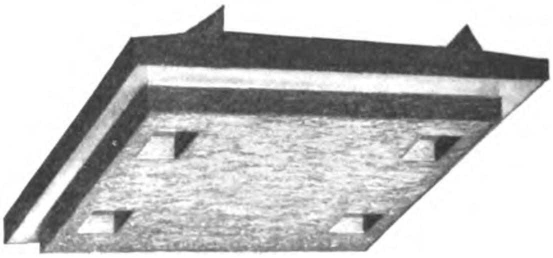
STRIP CONDUCTOR JACKET AND ITS APPLICATION TO FIG. 8 TROLLEY WIRE

One of the accompanying drawings shows the improved conductor applied to "figure eight" wire. A ribbon of copper is bent under and partially around the lower lobe to form a conducting envelope. A second view shows a roll of copper ribbon as used for splicing or patching.

The conductor is suitable for either direct or alternating currents, but for the latter it has a peculiar advantage due to the fact that the copper ribbon involves the principles of the "skin effect." This principle follows from the known fact that alternating currents, and especially currents of high frequency, seek to follow the outside rather than the inside of a conducting body; consequently if the outside is of conducting material of very low ohmic resistance, the conductivity of the conductor as a whole is greatly increased.

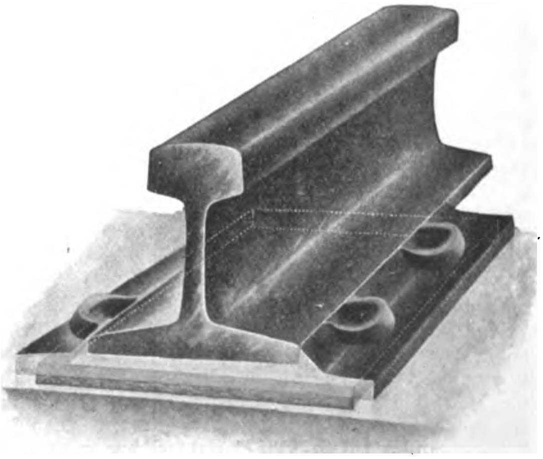
A Padded Tie Plate

On foreign railway lines the use of felt pads under metal tie plates to produce a comparatively silent roadway and decrease maintenance has met with good results, although the question of design has not been exploited to the limit. A more effective application of this principle to American conditions has recently been invented by the Track Specialties Company, New York. The new shock absorbing plate is available anywhere, but, naturally, is most useful for subway and elevated construction.



VIEW OF NOISELESS TIE PLATE WITH BOTTOM UP, SHOWING APPLICATION OF COW-HAIR FELT PAD

The means used by this company to get a noiseless roadway is to cast the tie plates of malleable iron with a bottom panel into which a cow hair felt pad 5½ in. x 8½ in. x ½ in. deep is inserted. The pad is protected against the action of the weather, and, at the same time, is held securely so as to absorb all shocks. These pads are designed not only to protect the ties, rail and tie plate, but also to take up some of the shocks now transmitted to the cars. The construction of the metal plate in malleable iron assures additional life because of the slow corrosion of this metal. It is believed that the combined plate, which has been named the "Superior," will last as long as the tie or even for the life of the rail. It should not be disturbed, unless the ties are being replaced or the rails relaid.



VIEW OF NOISELESS TIE PLATE WITH FELT PAD AS APPLIED UNDER A RAIL

News of Electric Railways

The I. C. C. New Haven Report

The report of the Interstate Commerce Commission in regard to the investigation which it conducted into the affairs of the New York, New Haven & Hartford Railroad was transmitted to the Senate on July 12. The principal findings against the management follow:

That the conduct of the financial operations of the New York, New Haven & Hartford Railroad presents "one of the most glaring instances of maladministration in all the history of American railroading."

That this maladministration resulted in an absolute loss of $65,871,299.

That the road's directors were guilty of gross dereliction of duty and of a breach of trust that was "morally wrong and criminal in its fruits."

That the downward movement of Boston & Maine stock did not begin until the Mellen-Morgan-Rockefeller management was forced upon it.

That the alleged purchase by John L. Billard of 109,948 shares of Boston & Maine stock and its resale to the New Haven was a fraudulent transaction; that Billard never bought a share of Boston & Maine stock except with money furnished by the New Haven and never sold a share except as the New Haven dictated; that the Billard Company was used by the New Haven to take over some of its own questionable assets and assets which it was desirous of concealing, and that Billard burned the company's books for the purpose of getting them out of the way.

That the New England Investment & Security Company was a device conceived to carry out the policy of the New Haven to acquire the electric railways of Massachusetts, and that it operated in violation of the Massachusetts laws and in flagrant violation of an injunction issued by the highest court of that State.

That the New England Navigation Company, after sale of its steamship properties, was utilized as a holding company for the accomplishment of irregular transactions which were indefensible under any test of sound business management.

That the practice was general of transferring funds from the New Haven back and forth to its 336 subsidiaries for the purpose of declaring dividends.

That the acquisition of the New York, Westchester & Boston Railway and the New York & Port Chester Railway was a profligate waste of corporate funds.

That the frequency with which dummy corporations and dummy directors appear in the New Haven's records leads to the conclusion that some one high in the councils of the road "had an obsession upon the subject of the utility of such sham methods."

The commission says that the standard of business ethics and the absence of financial acumen displayed in directing the destinies of the railroad and in the attempt to establish a monopoly of transportation in New England is indefensible. In characterizing the purchase of the New York, Westchester & Boston Railway as a story of profligate waste of corporate funds, the commission says that the road was not necessary as a part of the New Haven system and that the first information the board of directors had concerning the "extravagant acquisition" was on Nov. 8, 1907, when the committee which negotiated the purchase made its only report. It was then learned, says the commission, that "$11,150,000 had been expended in obtaining control of two insolvent promotion schemes and that this expenditure carried with it an obligation to construct two railroads under franchises of doubtful validity, paralleling the existing lines of the New Haven." Mr. Mellen's testimony is quoted in connection with this deal.

The commission reviews in detail the plans which were adopted for exchanging the New Haven stock for New York & Portchester and New York, Westchester & Boston securities and refers to the due bills which were issued in connection with these deals. It expresses the opinion that "it would seem that the amount legally expended could be recovered from Mr. Mellen and the directors who authorized it." According to the commission the total construction cost of the road as reported on June 30, 1913, was $22,344,165. The principal figures in this report follow: Land, $5,090,641; tangible street railway capital, $229,744; right-of-way, $9,448,649; electric line, $625,978; buildings and structures, $1,569,575; rolling stock and miscellaneous equipment, $843,169; construction expenses, including interest, $4,536,444. The commission says to this figure of $22,344,165 must be added the $14,090,008 expended before the construction began, making a total of $36,434,173, or a cost per mile of $2,020,752. It says that in providing the money for this construction bonds to the extent of $17,000,000 guaranteed by the New Haven Railroad were sold at a discount of $1,200,000. The commission says that the one accomplished result of the Westchester transaction was the stifling of possible competition into New York City from New England. It lays the blame for the Westchester transaction upon the directors of the New Haven road, saying that some are guilty of acts committed and others—the greater number—for their failure to act. It holds that all are alike culpable and responsible to the stockholders.

In connection with the taking over of the electric railways in Rhode Island the commission says that the purchase of these properties "was another instance of millions wasted in acquiring properties that bring an annual deficit instead of a surplus and constitute a liability instead of an asset in the New Haven system." The expenditures by the New Haven in money and securities in this connection are placed at $24,352,336 in acquiring a cash investment of $9,685,500. It reviews briefly the multiplicity of corporations involved in these transactions, these companies including the Rhode Island Company, New England Navigation Company, New England Investment & Security Company, Providence Securities Company and Rhode Island Securities Company. It says that the properties in Rhode Island have stood the New Haven system an average annual loss of approximately $648,680. It characterizes the Rhode Island and the Connecticut electric railway ventures of the New Haven Railroad as "further evidences of the prodigality in the expenditure of the money of the New Haven stockholders in carrying out an unlawful policy of transportation monopoly."

The report contains the correspondence between the commission and J. P. Morgan & Company regarding the proposal to have the representatives of the commission go over the books of the concern. The final paragraphs of the report deal with the legal status of the New Haven directors and contain the following comment:

"This investigation has demonstrated that the monopoly theory of those controlling the New Haven was unsound and mischievous in its effects. To achieve such monopoly meant the reckless and scandalous expenditure of money; it meant the attempt to control public opinion; corruption of government; the attempt to prevent the political and economic instincts of the people in insolent defiance of law. Through exposure of the methods of this monopoly the invisible government which has gone far in its efforts to dominate New England has been made visible.

"It has been clearly proved how public opinion was distorted; how officials who were needed and who could be bought were bought; how newspapers that could be subsidized were subsidized; how a college professor and publicists secretly accepted money from the New Haven while masking as a representative of a great American university and as the guardians of the interests of the people; how agencies of information to the public were prostituted wherever they could be prostituted in order to carry out a scheme of private transportation monopoly imperial in its scope."

The commission recommends:

Civil and criminal prosecution of the responsible directors of the New Haven.

The prosecution of John L. Billard and of all persons who were concerned with him in the purchase of the Boston & Maine stock.

That suit be brought against Marsden J. Perry and Oakleigh Thorne to recover for improper or double commissions paid in connection with the Westchester deal; also for $1,524,072 expended by Charles S. Mellen in obtaining the Westchester franchises and for the $2,748,700 paid to John L. Billard in the Boston & Maine stock transaction.

On the question of immunity the commission defends its action in compelling Charles S. Mellen and other directors of the New Haven to testify on the ground that it was better to expose wrongdoing even at the expense of giving immunity to a few witnesses than to leave the facts under cover and thereby give immunity to all, not only as to prosecution, but as to the stigma of exposure as well.

The following interesting comment on the report was made by John W. H. Crim, personal counsel of Mr. Mellen:

"Much is said about the increase in capitalization from $93,000,000 in 1903 to $417,000,000 at present. It ought to be remembered that in 1903 the New Haven owned 400 miles of road and leased 400 miles. It owns 7000 miles to-day. Hundreds of miles were taken over from bankrupt companies, the Central New England Railroad having always been a bankrupt road.

"The commission talks about the purchase of the Connecticut trolleys. They were purchasing Connecticut trolleys ten years before Mr. Mellen went to the New Haven. Of course they had to pay well for them. People foresaw their prosperity and held them for high prices. But these very electric railways earned 4 per cent dividends in 1913, and 5 per cent in 1914. And they are steadily increasing in value. It is not too much to say that the time will come when the electric railways will be the money-makers of the whole system. I had rather have the electric railways than the New Haven road itself. It would have been in the hands of receivers this year had it not been for the earnings of the electric railways. The earnings of the New Haven are eaten up by terminal charges. It costs 23 cents for every passenger who passes through the Grand Central Station. The electric railways are free from such expenses. The New Haven built many of its electric railways for this reason, recognizing that the short haul is unprofitable on a railroad line, and feeling the need of the electric railways for local business.

"I know of a case in New England. A railroad connecting two towns charged a 30-cent fare, and made about $3,000 a year. Mr. Mellen went up there, looked it over, and scrapped the railroad. He put in an electric railway and charged 10-cent fares. The following year the line showed 1500 per cent more profit.

"If the New Haven can keep its electric railways for ten years more, they will prove a wonderful source of income for the road. Indeed, if the attack on the railroad had not come when it did, it would have been shown that the road was not overcapitalized. It would soon have been in a position to show its earning power."

It was stated unofficially in Washington on July 15 that Attorney-General McReynolds had decided to file a suit for the dissolution of the company under the anti-trust law. As to possible criminal prosecution, it was said that if such prosecutions should become necessary they would naturally follow the conclusion of the civil suit.

Plans for Completing Dallas-Greenville Line

It has been announced that arrangements have been completed by which the Stone & Webster Engineering Corporation, through its district headquarters at Dallas, will complete the line of the Eastern Texas Traction Company between Dallas and Greenville. The grading and the construction of bridges, culverts, cuts and fills, which have been in progress for more than a year under the direction of Karner Brothers, has been practically completed and the roadbed is in condition for the immediate laying of the rails. The stockholders voted on July 2 to increase the number of directors of the company from three to seven, and the following new directors were elected: E. T. Moore, Richard Meriweather, Rhodes S. Baker and R. E. L. Knight. The first two mentioned are connected with the Stone & Webster Engineering Corporation, and the latter are members of the law firm of Spence, Knight, Baker & Harris, attorneys for the Eastern Texas Traction Company. The three former directors who now make up the seven are F. E. White, J. W. Crotty and T. G. Nichols, Greenville.

Proposed Draft of Des Moines Ordinance

The proposed franchise for the Des Moines City Railway which was recently submitted by the company to the city commissioners for their approval, provides for a franchise period of twenty-five years after the date of the formal adoption of the ordinance by the voters of the city. The other main provisions of the ordinance are as follows:

The company is to permit the use of its track by interurban railways, subject to the rules provided for its own cars, for a compensation to be fixed by mutual agreement or by state law. The city company is required to construct connecting tracks, overhead trolleys and adequate terminal facilities for the interurban lines. Upon the failure of the interurban railway to pay its compensation promptly its rights are to be suspended until payment, unless it gives a sufficient bond to be fixed by the railroad commissioners. The city company is given permission to use its tracks for hauling freight, baggage, mail and express matter, subject to resolution of City Council, provided this service does not obstruct regular passenger traffic.

The company is required within three years to expend $1,500,000 for the following: (1) construction of 5 miles of new lines or extensions; (2) removal of present unused tracks; (3) reconstruction of at least 20 miles of existing tracks with new rails; (4) increase of present power plant; (5) purchase of twenty-five new double-truck cars; (6) the construction of a line from the intersection of Seventh and Mulberry Streets across the viaduct on Seventh Street and over a new bridge on Seventh Street to a connection with its existing line now running to Fort Des Moines; and (7) the purchase from the Interurban Railway of the "Valley Junction Line" and the "Army Post Line" and the sale to the above company of the "Urbandale Line."

Whenever a majority of the adult residents of any district not served by the company petition the City Council for an extension, the company may be required to make the extension, provided the territory contains a sufficient population to produce a revenue equal to the cost of operating cars (including ordinary maintenance of tracks, cars and overhead trolley), together with reasonable depreciation upon the cost of the extension and the equipment used. The company is required to pay for the paving or repaving between its tracks and 1 ft. on each side of each outer rail and it must also keep in repair a similar portion of the pavement and floor of each bridge and viaduct crossed by its tracks. Without compensation it must permit its poles to be used by the city for signal, telephone and telegraph and electric light service.

The company's value is made equal to $2,754,000 for bonds, $1,305,000 for stock and $1,356,000 for bills payable, or a total of $5,415,000, to which there is added the previously mentioned $1,500,000 required for reconstruction and rehabilitation purposes. The company is to be allowed to pay dividends at the rate of 6 per cent per annum, and higher dividends according to the following: 7 per cent during any calendar year in which the company shall sell six tickets for 25 cents; 8 per cent for five tickets for 20 cents; 9 per cent for four tickets for 15 cents; 10 per cent for ten tickets for 35 cents. Out of the gross earnings the company is to pay the actual operating expenses, including ordinary maintenance, insurance premiums, injuries and damage claims not compensated by insurance; taxes of every nature, interest on bonds and other securities, depreciation not to exceed 5 per cent of the gross earnings unless the total dividends exceed 6 per cent and the dividends on stock.

Immediately upon the passage of the ordinance the City Council is to elect a city supervisor who is to hold office at its pleasure but who may be removed by a two-thirds vote. The company is to elect a company supervisor. These two supervisors shall control service, schedules, routes and terminals, character and equipment of cars, cost of service, extensions, rate of fare, the distribution of expenditures and the manner of keeping accounts. The city and the company before Dec. 15 each year are to select an engineer not a resident of the city. If the two supervisors fail to agree in any matter pertaining to the reconstruction and re-equipment of existing lines or the construction and equipment of any new line or extension, the matter must be submitted to the consulting engineer for final decision. For any differences that may not be decided by the consulting engineer the ordinance provides an impartial board of arbitration jointly chosen.

The maximum rate of fare for a single continuous ride shall be 5 cents. It is provided, however, that if on Jan. 31 of any year from the net earnings for the twelve months ended on Dec. 31 preceding there shall remain above the fixed charges an amount sufficient to have permitted the payment of dividends of 7 per cent if the company had sold six tickets for 25 cents during these twelve months, the company must sell for the ensuing twelve months six tickets for 25 cents. Similar provisions are made in regard to the other rates of return. Transfers are provided at all intersecting points and on lines within 300 ft. of the transfer line, provided the passenger is not reversing his general direction of travel. No free passengers are to be allowed except firemen and policemen in full uniform and employees of the company. The salaries paid by the company are subject to regulation by the city and to arbitration in case of disagreement. The ordinance also provides that upon six months' previous notice in writing the city may purchase the entire railway system for one of three choices of consideration. The ordinance is to go into effect sixty days after being accepted by the voters of the city.

Mr. Whitridge on Current Events

Frederick W. Whitridge, president of the Third Avenue Railway, New York, N. Y., sailed on July 14 for Liverpool after spending five weeks in New York attending to business since he arrived on the *Aquitania* on June 5. He expects to be away about three months. Mr. Whitridge is reported to have said:

"I am coming back on the crest of the Wilson boom. I cannot give the exact day, but I have booked my return passage in October so as to give the boom sufficient time to come along.

"The Interstate Commerce Commission seems to be a clumsy, inarticulate lot, with a penchant for shady lawyers. I am not subject to their jurisdiction, and cannot speak of them from experience, but I have read their maunderings about their foolish and futile valuation notions, and I was told a few months ago of the illegal and impertinent questions they sent to the railroads. Some of the railroad presidents refused to answer, but I presume many of them did, for our public is being rapidly educated to believe that an official demand for the kotow may not be refused. If it is not, however, stoutly refused, some of our officials never will learn that humility which is the beginning of wisdom.

"Many railroad men also tell me that under the system of accounts prescribed by the commission, the object, or certainly the effect, is to make net earnings loom unnaturally large by charges to capital which should be made to operation. If this be so, the ultimate consequence cannot but be disastrous. Whether it is true or not, it is evident that the commission is slower than death to recognize the necessity for increasing rates, and, therefore, however conscientious the members may be, they are afraid, though they can be brave enough over a State scandal.

"It is also evident that the commission has not got a glimmer of the truth expressed a year or so ago in England by the Prime Minister, Mr. Asquith. On the occasion of settling a strike by the increase of wages which had been awarded by arbitrators, Mr. Asquith said to the railroads that in order to help them to grant the increase he would promise legislation which would 'pass the extra charge on to the public.' That is what we must learn here. Public authorities are continually imposing charges upon the railroads, increased taxes, full crew laws, arbitrations, increasing wages, compensation acts, etc., which all in effect constitute charges prior to our mortgage bonds.

"Now that rascality and bad management are supposed to have been eliminated by State regulation, and there can be no cooking of accounts, where is the money to come from to pay these charges, except from the pockets of the public? If the railroads are to remain solvent and efficient, all such charges as these must, as Mr. Asquith said, be 'passed on to the public.' The press is beginning to perceive this. Until the Interstate Commerce Commission learns it, the gigantic boom Mr. Wilson has promised us will, notwithstanding the crops, remain stalled."

Another Franchise Proposed in Toledo

The franchise proposal of the Non-Partisan League was submitted to the franchise committee of the City Council of Toledo, Ohio, on the evening of July 14. The committee will consider an July 20 all franchise proposals made up to the present time.

The Non-Partisan League draft is intended as an alternative to the Thurstin-Campbell, or municipal ownership, plan, which will be voted upon by the people in August. The franchise covers a period of twenty-five years from the day it becomes operative and includes all the railroad property now in existence within the city limits and all extensions built in the future. It is provided that other companies may use the tracks and overhead equipment of the Toledo Railways & Light Company upon such terms as the Council may deem proper. The city is to exercise the same regulatory care over such other company as over the original holder of the franchise. The company is obligated to pave or repave between its tracks and to a distance of 12 in. outside and keep this paving in repair. Ice and snow must be taken from the tracks and during the summer months the company must keep them sprinkled.

Within eighteen months after the ordinance goes into effect the company must have all its cars equipped with pay-as-you-enter or pay-as-you-leave appliances. If possible 150 of the cars are to be so equipped within five months. This is to be done either by the replacement of the present cars with new ones or by converting the old ones. The city reserves the right to control service, fix schedules and routes, designate the character of the cars and increase service. Should the Council insist upon service that, in the opinion of the company, would impair the interest fund the company may resort to arbitration.

The right is reserved to the city to allow interurban railways to use the tracks, poles, wires and power within the city limits upon such terms as the Council may deem equitable. Interurban railways seeking entrance must each have at least 10 miles of track outside the city before they can secure the rights mentioned, and such company's tracks are to be used only to reach an interurban terminal within the city and not for local business.

A street railway commissioner is to be appointed by the Mayor with the approval of Council. His salary is not to exceed $750 a month. The expense of his department is limited to 1 per cent of the amount set apart any month as an operating fund. The company is to furnish suitable offices for the commissioner.

All questions or possible disagreements not exempted by the franchise are to be subject to arbitration. The party bringing up the question first is to select a member of a board of arbitration and notify the other party, who will then select a member and these two are to choose the third. If they fail to agree the member of the Public Utilities Commission whose term expires first is to make the appointment. Should he fail to act, the member of the commission whose term expires next is to perform this duty, and finally the third, if found necessary. Specific directions are given for the submission of questions to arbitration and the manner in which they shall be taken up and treated.

Should the city and company not agree upon a valuation for the purpose of fixing the rate of fare and the return to the company, the question is to be submitted to arbitration. No values are to be allowed for anything except the physical and tangible property.

The company is authorized to sell its capital stock at not less than par and its bonds at a price that will yield not more than 6 per cent on par. All bonds are to contain a provision making them payable at 105 and accrued interest on ninety days' notice at any interest period. The company is to provide for refunding all indebtedness or liabilities constituting a lien on the street railway property. An interest fund of $250,000 is to be created by depositing that amount from funds on hand or from the sale of stock or bonds for that purpose. Each month the amount remaining after deducting from the gross receipts for the month 11½ cents per car mile for the regular motor cars, and 60 per cent of 11½ cents per car mile made by trail cars, and sums provided for maintenance, renewal and depreciation is to be deposited and constitute the interest fund, out of which all taxes, interest, dividends and other payments are to be made.

This allowance may be increased at times if found necessary to meet extraordinary expenses.

The maintenance fund is provided by an allowance of 4 cents per car mile during January, February, March, April, May and November and 5 cents per car mile for June, July, August, September, October and December for motor cars and 60 per cent of these rates for trail cars. If found necessary an increase may also be made in the allowance for maintenance and depreciation.

The maximum rate of fare for each passenger eight years of age or over is to be 5 cents cash or six tickets for 25 cents, with transfer to any other line necessary to reach a desired point. In addition to this the following scale of fares has been established:

a. Five cents cash with free transfer, eight tickets for 25 cents, 1 cent for transfer.

b. Five cents cash with free transfer, 3 cents when exact change is tendered, five tickets for 15 cents, 1 cent for transfer.

c. Five cents cash fare, with transfer free, 3 cents when exact change is tendered, four tickets for 10 cents, 1 cent cent for transfer.

d. Five cents cash fare, with free transfer, 3 cents when exact change is tendered, four tickets for 9 cents, 1 cent for transfer.

e. Five cents cash fare, with free transfer, 2 cents when exact change is tendered, five tickets for 10 cents, 1 cent for transfer.

f. Five cents cash fare, with transfer, 2 cents when exact change is tendered, eight tickets for 14 cents, 1 cent for transfer.

Children under eight years of age, 1 cent, and children in arms, free.

The rate of fare to be put into effect when the ordinance becomes effective is that noted in paragraph *a.* This is to continue eight months if 150 of the newly equipped cars are in operation within five months from the time the ordinance becomes operative. If not then this rate is to continue three months beyond the date they are put into operation. This will constitute the trial fare. If, at the end of the period named, the interest fund is below $250,000, the next higher fare is to be installed and continue six months. Thereafter that rate is to be changed to a lower rate whenever the interest fund of $250,000 is exceeded by $100,000, or has reached $350,000.

Provision is made for the acquisition of the property by the city. The return on the capital value is to be 6 per cent from the start, but provision has been made for higher returns in proportion to possible reductions in the rate of fare.

William Barclay Parsons to Report on Detroit Transportation

William Barclay Parsons, of Barclay Parsons & Knapp, New York engineers, has been retained by the Detroit Street Railway Commission to report on Detroit's transportation needs. The total cost will be $32,000. The commission will ask the Common Council to appropriate this amount out of the remaining $50,000 at the command of the commission. The work is to begin as soon as the contract is signed and the appropriation made.

Mr. Parsons will submit to the commission six sets of plans for the relief of present crowded traffic conditions. Whether these plans will include subways will depend upon his findings regarding the advisability of the project. With each plan will be an estimate of the approximate cost, the number of passengers the system will be able to care for, and the profits likely to be derived. The plans will be of such a nature that specifications for the construction of lines can be drawn directly from them. The terms of the contract provide that Mr. Parsons is to receive $5,000 a week for five weeks and the remainder of the $32,000 when his specifications have been completed and accepted by the commission.

Corporation Counsel Lawson of Detroit has rendered an opinion to the effect that the Detroit United Railway is not obliged to render any assistance to the Street Railway Commission in the appraisal which is now being made by Prof. E. W. Bemis, and that any assistance so given by the company is purely in the nature of courtesy. The company has arranged to give full access to representatives of the appraisers to all of the company's property within the city and to provide such other data as they may desire.

The Kansas City Aftermath

Shortly after the ordinance extending the franchise of the Metropolitan Street Railway, Kansas City, to thirty years, was passed, Philip J. Kealy, the company's representative on the board of control, left for Chicago, with Robert P. Woods, the city's representative. The two members plan to spend about ten days inspecting railway systems in the East and Middle West.

The company has ordered the half-fare tickets for children between the ages of eight and twelve. They will be distributed as soon as the printer delivers them. Half-fare tickets will be carried by conductors and will be sold at various stations.

Indications are that little other action will be taken until Judge Hook, of the federal court, outlines a plan for the reorganization of the company and the clearing of the receivership. Officers of the company stated that their efforts would be devoted to the reorganization for the present, and that other matters would be taken up later.

The company has not yet named its six directors, though the two receivers were selected as members. Frank Hagerman, temporary president of the Kansas City Railways Company, left on a short vacation following the election.

The salaries of the two members of the board of control were fixed at $7,500 a year. The board will care for all duties heretofore handled by the receivers.

The Nelson papers in Kansas City continued their attacks on the company following the election, alleging unfair tactics at the polls. Joseph Siegel was arrested on the day of the election and pleaded guilty to voting twice, once for and once against the franchise. He was sentenced to two years in the penitentiary.

Elsewhere in this issue extended reference is made to the means adopted by the company to ascertain the attitude of the voters in advance of the election, and an abstract is published of the new franchise grant.

Rapid Transit Construction Progress in New York

Alfred Craven, chief engineer of the Public Service Commission for the First District of New York, has notified the commission that the Terry & Tench Company, Inc., the contractor for the construction of additional tracks of the Fulton Street elevated line in Brooklyn, for operation under the dual system agreements by the New York Municipal Railway Corporation, had, on June 25 begun work on its contract by delivering its plant on the line at Fulton Street near Troy Avenue. The Fulton Street line is now a two-track railroad, but under the dual system plan a third track will be added to provide express service in the rush hours.

The commission adopted the form of contract for the construction of Section No. 2 of Route No. 48, which is a part of the William Street branch of the Seventh Avenue subway in Manhattan, for operation by the Interborough Rapid Transit Company, and has transmitted it to the Interborough Company for its criticisms and suggestions. As soon as the contract is returned by the company the commission will put it in permanent form and advertise for bids.

The Board of Estimate & Apportionment has approved of the award of the contract for the construction of Section No. 1-A of Routes Nos. 4 and 38, part of the Seventh Avenue subway in Manhattan, to the Rapid Transit Subway Construction Company, the lowest bidder, for $474,244.

The commission has received bids for the supply of special work for the Fourth Avenue subway in Brooklyn. The Indianapolis Switch & Frog Company, Springfield, Ohio, was the lowest bidder for this work.

During the week Chairman Edward E. McCall and Commissioner Milo R. Maltbie held an informal hearing in regard to the construction of a subway up Central Park West, Manhattan. Suggestions were made that this line could be connected either with the new Broadway subway, for operation by the New York Municipal Railway Corporation, or with the existing subway at Columbus Circle. Chairman McCall made the statement that the commission was in favor of the construction of such a line, but did not have sufficient funds to carry it out. He promised his audience that if they would wait on the Board of Estimate and Apportionment and secure its promise of an appropriation for the line, the commission would act on it favorably.

Centralized Control in Chicago

In a report made public by Montague Ferry, Chicago commissioner of public service, he suggests that the close relationship shown among public service corporations in that city may constitute a grave menace to the public, and urges a further investigation by the State Public Service Commission to determine whether the city suffers by reason of the centralized control. Named in particular in the report are Samuel Insull, John J. Mitchell, James A. Patten, Henry A. Blair and Ira M. Cobe, who, according to Mr. Ferry, exercise control over the Commonwealth Edison Company, the People's Gaslight & Coke Company, the Chicago Elevated Railways, the Chicago Surface Lines and numerous utility companies in surrounding towns. A chart, which accompanied the report, was said by Mr. Ferry to show that "three men constitute a majority of the executive committee of five which directs the business of the Commonwealth Edison Company; that the same three constitute a majority of the board of directors of the gas company; that Mr. Insull and Mr. Blair, who is also a director in the Commonwealth, are a majority of the executive committee of three which controls the elevated lines; that Mr. Blair, as chairman of the board, is the controlling factor in the Chicago Railways; that Samuel Insull, with men holding salaried positions in the Commonwealth Edison Company, controls the Public Service Company of Northern Illinois and the Middle West Utilities Company."

Mr. Ferry said:

"No facts are in the possession of the department of public service which would justify the statement that the prices paid for current by the several transportation companies is excessive. But the circumstances under which these contracts were made, with substantially the same men as buyers and sellers, suggest inquiry."

The report was asked for by the City Council and will be considered by the committee on gas, oil and electric light.

Samuel Insull has answered Mr. Ferry in part as follows:

"The stockholders of each of the companies are thousands in number. None of the directors could hold their positions unless they had the confidence of the security holders. So far as the public is interested, for years the prices paid for electricity, and for gas, too, were regulated by the City Council. Now such prices are regulated by the Public Service Commission. We cannot issue any securities, we cannot take any step without going to that body.

"All of these enterprises are monopolies in their separate fields, and rightly so. The city has been trying for years to get a unified transportation service, with universal transfers. I do not see how it is possible to get one system, a single fare and universal transfers except by having all the lines controlled by one set of men. The way to run the business of electrical production most economically is to run it as a monopoly. The same thing is true of gas. If the electrical company sells electrical energy to the transportation company the price the latter pays cannot be covered up. The Public Service Commission knows that price and passes on it.

"The best reply to Mr. Ferry is, that whenever Chicago has investigated prices in other cities for electricity furnished for transportation and other purposes, it has been proved that in Chicago electrical current is sold at a lower price than it is in any other large city in the world. Of course, we do not pretend to compete with hydraulically generated power.

"The only general reply I can make is that experience shows—and the statement is provable by figures—that electricity can be sold to the consumer at the lowest price when all the electrical energy of the community is produced under one system of generation and distribution. What is true of electricity is true of gas and of transportation."

Plans for a new audit of financial dealings of the surface railways with the city were outlined at the meeting of the Council committee on local transportation on July 7. It was decided that the new audit should take into consideration the 1907 and subsequent traction ordinances, including the 1913 unification measure, and should show what has been done under both the corporation counsel's interpretation of the ordinances and that of the board of supervising engineers. It was agreed that the audit should be done by Nov. 1.

The Hazleton Strike

The Lehigh Traction Company, Hazelton, Pa., is reported to have defaulted in the payment of the interest due on June 1 on its $500,000 of first mortgage 5 per cent gold bonds. A committee has been appointed to investigate the affairs of the company, and the Northern Trust Company, Philadelphia, Pa., has been designated as depositor for the bonds. The investigation into the affairs of the company will be conducted by W. F. Snyder, president of the Northern Trust Company, and W. H. Watts and G. P. Bursell of Robert Glendenning & Company, bankers, Philadelphia. George W. Pepper has been retained as attorney.

The Wilkes-Barre & Hazelton Railroad, which controls the Lehigh Traction Company, defaulted in the payment of the interest on its $1,900,000 of collateral trust 5 per cent bonds due on May 15. As stated previously in the ELECTRIC RAILWAY JOURNAL this company requested bondholders to accept in return for their May 15 certificates and all other certificates up to and including Nov. 15, 1916, non-interest-bearing certificates as the different coupons become due.

The financial difficulties of the Lehigh Traction Company are attributed in part to the strike of its employees which has been in progress for more than six months. Organized labor is particularly strong in the territory in which the company operates, and while full service has been in force for months the patronage of the company has suffered severely. Efforts made by the United States Government, the Pennsylvania State Department of Labor and Industry and the municipality to bring about a settlement of the differences between the company and the men have proved unavailing.

The strike resulted through the failure of the effort made to arrange a new agreement between the company and the men in December last. The company agreed to advance the wages of first-year men from 22 cents to 23 3/9 cents an hour; second-year men, from 23 cents to 24 4/9 cents; third-year men, from 24 cents to 25 5/9 cents. It insisted, however, that the clause be stricken from the proposed agreement which stated that all cases of discharged men should be submitted to arbitration. The men demanded $3.15 for a nine-hour day, with 52½ cents an hour for overtime. They promised not to go out on strike without giving the company notice in advance. On Jan. 1 the strike was declared without any notification to the company. Representatives of the company declare that they will not re-employ the five men who broke their word. The racial question has also injected itself into the siuation.

The present strike is believed to have an important bearing on the question of trade unionism in the coal fields. Several factories in Hazelton have recently declared for the open shop and organized labor is said to feel that the Markle interests, mine operators who are identified with the railway, hope through continuing the present strike, further to disrupt the unions.

Statements from the company giving the facts in connection with the strike were referred to in the ELECTRIC RAILWAY JOURNAL of Jan. 24, page 201, and April 18, page 894.

Low Suburban Fares On Southern Pacific

The California Commission has recently been conducting another hearing on the passenger rates in effect on the ferry and electric lines of the Southern Pacific Railroad between San Francisco and Oakland. The hearing was begun because of a complaint by residents of the San Francisco peninsula on the ground of discrimination. Certain of the transbay fares were lowered in October, 1913, from 15 cents one-way fare to 10 cents, after a hearing by the commission as mentioned in the ELECTRIC RAILWAY JOURNAL, Dec. 13, 1913. In answer to the present complaint, the company has requested the commission to raise the transbay rates from 10 cents to 12½ cents for the one-way fare. After a hearing in San Francisco on June 16, 17 and 18, the case was adjourned for sixty days to allow attorneys for the transbay cities to digest the data submitted by the company.

The Southern Pacific Company submitted an expert valuation report on the property involved in the suburban service in question, showing that the revenue from the ferries and the electric system or from any one individual line of the system was not sufficient to meet the cost of operation, plus interest and taxes. It was asserted that only three of the best lines paid even the bare operating expenses. J. B. Pope, valuation engineer for the company, testified that the property used in the suburban service had a total value of $25,553,667. This sum included one-half of the value of the Oakland pier, which is used jointly by steam and electric trains, and also the values of other property used jointly, apportioned according to the comparative number of passengers handled by each kind of motive power.

According to the testimony of F. L. McCaffery, auditor of disbursements for the company, the total deficit on the suburban system for the first four months of 1914 with interest at 7 per cent on the investment was $686,515. If the ferry system were also considered, the total deficit for the four months would be $752,754. During this four-month period the company carried more than 6,400,000 passengers on the ferry system, so that the loss per passenger is claimed to be 11.81 cents, making an annual deficit of $2,258,263 against the suburban electric system. The following table is a brief summary of the figures presented by Mr. McCaffery:

JANUARY TO APRIL, 1914, INCLUSIVE

	Electric	Ferry
Gross operating revenue	$298,538	$228,383
Operating expenses	354,294	234,719
Deficit	$55,756	$6,336
Other expenses, taxes, etc	60,228	10,848
Deficit	$115,984	$17,184
Interest on investment for four months	570,531	49,054
Total deficit	$686,515	$66,238
Total ferry and electric		$752,754
Average annual deficit		$2,258,262
Capital investment—ferry		$2,102,324
Capital investment—electric		24,451,343
Total investment		$26,553,667

At the previous hearing on this subject the California Commission declared that the apportionment of expenses of maintaining and operating the ferry boats on the basis of the number of passengers carried by the steam lines and by the electric lines was erroneous and unfair to the suburban lines. Just what different allocations of expenses have been made between steam and electric traffic in the present case cannot be determined until the commission makes its final report on the hearing.

Progress in Extending the Municipal Railway in San Francisco

Rapid progress on all three of the new municipal railway lines now under construction in San Francisco is reported by the city engineer's office in that city. The work on the Van Ness Avenue line, which will be the main route for the entire city system to the exposition grounds, is 75 per cent completed and there is every indication that the work will be delivered to the city by Aug. 4, thereby earning for the contractor the maximum bonus of $15,000 at the rate of $30 per day. It is expected that this line will be operating by Aug. 15.

On the Stockton Street and the Potrero Avenue lines large forces are at work. It is expected that the full amount of bonus will be earned in each case. This means that the Stockton Street contract must be completed by Aug. 1 and the Potrero Avenue line, which is now 60 per cent finished, by Aug. 23.

Advices from the Jewett Car Company early in July stated that four of the new cars on order had already been shipped from the factory, and that others would follow in time to make a total delivery in San Francisco of twenty-five cars before July 14. Other deliveries are to be made before the fourteenth of each succeding month until all of the 125 cars contracted for are in the possession of the city. This will entitle the car company to the bonus of $5 on each car delivered thirty days ahead of the time specified in the contract. The new cars, while of the same length as those now in use on the Geary Street line, will be 8½ in. wider, will seat fifty persons as compared with forty-four on the old cars, and will weigh 4000 lb. less. The cost of the new cars is to be $7,038 each as compared with $7,700 for those now in use. It is estimated that the weight reduction will effect an annual saving of $200 per car in operating costs. The new trucks and motors are already in San Francisco, and as soon as the car bodies are received the cars will be assembled and put in commission on the Geary Street line replacing the old cars, which will not be again in use until the rush of exposition traffic begins.

Municipal Ownership Results in Edmonton

The financial difficulties which have been met in the operation of the municipal electric railway at Edmonton, Alberta, were reviewed in the ELECTRIC RAILWAY JOURNAL of June 13, page 1334, as they had been set down in the Edmonton *Official Gazette*. W. J. McNamara, who took office as Mayor of Edmonton in January, was in New York recently. He seemed to feel that the statements made in the official organ of the Municipal Council had been misinterpreted. In further explanation of them he said:

"Notwithstanding the reports to the effect that municipal ownership has fallen down in Edmonton, the premier city of Alberta, the plan has worked out successfully, and those reports are absolutely false, and our city affords a splendid vindication of the doctrine. When I went into office we found that the street railway was not paying. The reason was that we were selling transportation below cost, and I started a fight to raise the rates. I was not backed up by members of the Council, but the fight was won, and the fare was raised to a straight 5 cents. Immediately the street railways were put into good shape. Not only did we pay expenses and add to the sinking fund, but we were able to start wiping out the deficit. One reason for the loss had been the cost of materials, construction, and operation, which were far in excess of the figures for New York. For instance, we had to pay $60 a ton for steel rails—more than double what they would have cost in New York. We had the long haul and the tariff against us. As a matter of fact, the cost of materials was fully 100 per cent greater than what it would be here. Another thing, the maintenance and operation cost 35 per cent more than here. As for the price of transportation, tickets were sold at six for 25 cents, and at certain hours eight could be had for that sum, while children were carried at half fare. As a result of charging a fair price we have turned a utility running at a loss into a splendidly paying concern. There was another thing that added to our expenses. The railway had been extended out far into unoccupied territory, where land owners hoped some day the population would come."

Right of Ohio Commission to Order Valuation Questioned

The committee appointed by the Central Electric Railway Association some time ago to determine ways and means for valuing the electric railways in Ohio, as directed by the Public Utilities Commission of that State, now reports that it has grave doubts of the legality of the commission's order. In this connection the committee propounds for the consideration of the commission the following problem:

"Can this commission arbitrarily abrogate such contracts or set aside the statutes of the State when it is a fact that the present maximum rate of 2 cents a mile is, in many instances, inadequate to produce the income necessary to pay the everyday operating expenses, much less set aside a sum to take care of the deferred maintenance and afford any return on any kind of value?

"In complying with the order the public utilities and electric roads of Ohio will have to spend an enormous amount of money and a great deal of the time of their officers and other employees that can be ill afforded from their other duties. As it is likely that in the majority, if not in all, cases this order will be wholly unjust by reason of any results which may be produced as affecting the reasonableness of the present legal rates and charges, should not the legality of the order by the commission be ascertained before any such expense is incurred?"

The commission requested that the schedules of value asked by it be filed by the companies by Jan. 1, 1915.

Injunction in Ohio Fare Case

In the injunction case of the Ohio Traction Company and the Cincinnati & Hamilton Traction Company against the city of Cincinnati, Judge John E. Sater of the United States District Court on July 9 overruled the contention of attorneys for the city that the Federal Court has no jurisdiction in the case and granted the plaintiffs a perpetual injunction, preventing the city from putting in force an ordinance to reduce the fare on the Millcreek Valley line between the city and Carthage and Hartwell from 10 to 5 cents.

The court also held that all the franchises under which this line is being operated between Fifth and Walnut Streets and the present north corporation line of the city are valid and have not expired and that the enforcement of the ordinance would wrongfully impair the property rights of the companies and would operate to the detriment of the stockholders and creditors.

The court held that the failure of the city in former cases to attack the validity of the grant of the Zoological Land Syndicate covering the portion of the line over Erkenbrecher Avenue, between the southern boundary of the syndicate's land and the Carthage pike and 241 ft. between Vine Street and the southern boundary of the syndicate's land, to which the city claims the syndicate has no right of ownership, estopped the city from coming into court at this time with such contentions. Each of the other contentions of the city was decided adversely. City Solicitor Walter Schoenle announced that the case would be appealed to the United States Circuit Court of Appeals.

Kansas Strikers Return.—The strike of employees of the Union Traction Company, Coffeyville, Kan., which began on March 31, was called off on July 8 by the car men. Practically all of the employees have been taken back by the company.

Westinghouse Strike Called Off.—The strike of the workmen of the Westinghouse Electric & Manufacturing Company at East Pittsburgh, Pa., was called off by the men on July 9. While the day set for the men to return to work was July 13 many men reported on July 10 and 11. The works are now running on full time.

State's Attorney's Action Ruled Out.—State's Attorney Maclay Hoyne, of Illinois, has been prevented from proceeding against the Union Consolidated Elevated Railway for overcapitalization by Circuit Court Judge Windes. In rendering his decision Judge Windes said: "The state's attorney is acting too late. An action against the company for overcapitalization, if there is cause for it, should have been brought many years ago. By inaction the people have acquiesced in the actions of the company."

The Pittsburgh Wage Arbitration.—Judge Joseph Buffington, Attorney James H. Gray and Representative Stephen C. Porter have been chosen to arbitrate the differences regarding wages and working conditions between the Pittsburgh (Pa.) Railways and its employees. They have been holding sessions and hearing evidence from both sides since July 10. Many of the employees have been called to testify. Expert testimony as to the cost of living and the sufficiency of wages was given by J. Scott Nearing, professor of political economy at the University of Pittsburgh, and by others. Witnesses were still being heard on July 14.

Utility Legislation in Colorado.—Application for a writ of injunction was filed in the District Court at Denver, Col., on July 3 by Attorney General Fred Farrar to restrain the Secretary of State from referring to referendum the bill creating the public utilities commission passed at the last regular session of the Legislature, and upon which corporation interests filed a petition for referendum. If the contention of the attorney general is sustained and the bill is ordered off the official ballot for the November election, the law will become effective and the State Railroad Commission will be replaced by the Public Utilities Commission.

The Philadelphia Conference of Mayors.—It has been decided to hold the conference of Mayors, proposed by Mayor Blankenburg of Philadelphia, in that city on Nov. 12, 13 and 14. As announced in the ELECTRIC RAILWAY JOURNAL of July 4, page 43, the plan is to establish a bureau of public utility research in the interest of the cities. Invitations were sent to more than 100 mayors to participate in the conference and on July 13 it was reported that acceptances had been received from more than fifty. Mayor Blankenburg has asked that suggestions regarding the convention he addressed to M. L. Cooke, director of public works, Philadelphia.

The Cleveland Schedule Question.—George R. Davies, president of the local branch of the Amalgamated Association of Street & Electric Railway Employees at Cleveland, stated recently that an attempt would be made to have the old schedules restored by the Cleveland Railway. He alleged that Section 8 of the contract with the company fixed the order in which the runs shall be completed and sets the number of hours for the completion of the runs. He said the matter had been appealed to the international union. Many motormen and conductors are said to have expressed the opinion that the company's offer would have carried in a referendum vote if the men had understood it clearly.

Philadelphia Co-operative Plan to Continue.—The co-operative plan under which the Philadelphia (Pa.) Rapid Transit Company deals with its motormen and conductors as individuals rather than as an organization, will be continued in force for another year. The result of the vote on July 14 was 3406 in favor of continuing the arrangement and 2801 against it. As 6522 men qualified to vote the vote against the plan was 1547 short of the two-thirds negative vote required to interfere with the continuation of the plan as now in effect. This is the third time the men by secret ballot have endorsed the method of conducting the co-operative plan with the men as individuals instead of entering into a contract with organized labor.

The Strike on the Joplin & Pittsburg Railway.—No indications were in evidence on July 11 that the strike of the 149 employees of the Joplin & Pittsburg Railway, Pittsburg, Kan., which began on July 6, would be ended shortly. The strike took place when negotiations following the expiration of the old agreement on June 21 were unsuccessful. The agreement was continued temporarily by mutual consent until July 6, when the strike order was issued. The men demand an increase from 26 to 40 cents an hour, with stipulations regarding the company's right to discharge employees. The strike has seriously crippled business in the territory touched by the road, the coal and metal mining industry being particularly affected. Steam roads have put on special service.

The Detroit Running Inventory.—In commenting in the issue of July 10 on the proposed appraisal of the property of the Detroit (Mich.) United Railway within the city the *Electric Railway Service* said: "We name a few of the developments as indicating that the inventory of 1909 cannot under any possible viewpoint be taken as the inventory of 1914. During all this intervening time the inventory has been kept up to the minute. The cost of all this inventory from 1909 to June 1, 1914, has reached the total of $147,991. This represents the wages of the men working upon the inventory directly and does not include any portion of cost of the executive department of the company or the services of the large number of regular employees whose time was partly employed in this work."

Chicago Terminal Committee Off for Europe.—The members of the committee from the Chicago City Council and the engineers in charge of the terminal plans in that city arrived in New York on July 14 and sailed for Europe on July 15. At the head of the commission is John F. Wallace, formerly chief engineer of the Panama Canal. The other members of the commission are Walter L. Fisher, ex-secretary of the interior; Bion J. Arnold, chairman of the Board of Supervising Engineers, Chicago Traction; Edward H. Bennett, consulting architect of the Chicago plan commission; Lawrence E. McGann, commissioner of public works of Chicago; John W. Beckwith, first assistant corporation counsel of the city, and Ellis Geiger, chairman of the Aldermanic committee on railway terminals. To assist the seven members of the railway commission and to gather ideas about other things of importance in the Government of big cities, five Aldermen and the secretary of the City Council committees were appointed by Mayor Harrison to accompany the committee. The commission visited Toronto, Montreal and Boston on the way to New York, and spent July 14 examining New York terminals. The party is due in Liverpool on July 20. After an inspection of the docks there the members will go to London, thence to Paris, Frankfort, Vienna, Budapest, Dresden, Berlin, Leipsic, Hamburg, Kiel, Copenhagen and Stockholm. They will sail from Liverpool on Aug. 22.

Financial and Corporate

Stock and Money Markets

July 15, 1914.

In the trading on the New York Stock Exchange to-day the prices of many issues were carried to the lowest levels reached in years. New Haven made a new low record, 49¾. The railroad issues particularly were hard hit. Only brisk short covering toward the close prevented many sharp net declines. As a matter of fact there was a fair volume of business, with a distinct two sidedness to the course of quoted values. Rates in the money market to-day were: Call, 2 per cent; sixty days, 2½ @ 3 per cent; four months, 3¼ @ 3½ per cent; six months, 3¾ @ 4 per cent.

The trading in Philadelphia to-day was apparently not influenced much by the trend in New York. The tone was firm and the market ended strong.

The Chicago market was weak to-day. Bonds, however, held firm.

Under the lead of New Haven, sharp declines were recorded in Boston to-day. The selling was heavy and the lowest levels were established at the end.

In Baltimore business on the Stock Exchange was fairly active to-day. The sales of stock totaled 2,537 shares, while the bond transactions amounted to $34,400, par value.

ANNUAL REPORTS

The Duluth-Superior Traction Company

The comparative statement of income, profit and loss of the Duluth-Superior Traction Company, Duluth, Minn., for the calendar years 1913 and 1912 follows:

	1913	1912
Revenue from transportation	$1,260,061	$1,060,937
Other revenue	23,853	22,322
Total revenue	$1,283,914	$1,083,259
Way and structures	$52,627	$38,205
Equipment	65,577	49,868
Traffic	655	618
Conducting transportation	463,266	414,886
General and miscellaneous	166,039	126,610
Total operating expenses	$748,164	$630,187
Net operating revenue	$535,750	$453,072
Taxes	$66,537	$61,001
Depreciation	74,100	70,114
Total taxes and depreciation	$140,637	$131,115
Surplus available for fixed charges and dividends	$395,113	$321,957
Fixed charges	$179,526	$158,294
Dividends, preferred stock	60,000	60,000
Dividend, common stock	148,750	175,000
Total fixed charges and dividends	$388,276	$393,294
Net income to surplus account	$6,837	*$71,337

*Deficit.

The above report shows a general increase in the revenues and expenses of the Duluth-Superior Traction Company during the calendar year 1913. The revenue from transportation increased 18.8 per cent; maintenance of way and structures, 37.7 per cent; maintenance of equipment, 31.5 per cent; total operating expenses, 18.7 per cent; net operating revenue, 18.2 per cent; taxes, 9.7 per cent; depreciation, 5.7 per cent, and surplus available for fixed charges and dividends, 22.9 per cent. The total charges and dividends decreased 1.3 per cent, giving a net income of $6,837, as compared to a deficit of $71,337 the year previous. The percentage of operating expenses (including taxes and depreciation) to gross revenues was 69.23 in 1913, as compared to 70.28 in 1912.

There was expended for renewals and charged against depreciation reserve during the year $33,076, and the appropriation to the depreciation reserve for the year was $74,100. In addition to this appropriation the sum of $18,900 was expended to meet the sinking fund requirements of the mortgage securing the general mortgage twenty-year 5 per cent gold bonds, $21,000 par value of these bonds being retired. Expenditures aggregating $63,067 were made during the year for new construction and extensions, including as the principal items $7,948 for new cars and equipment, $19,175 for new track, $10,305 for conduit and feed wires and $21,331 for substations. The total miles of single track operated by the company amounted to 82.47. The gross passenger earnings per mile of single track were $15,262 and the gross passenger earnings $1,258,638.

American Power & Light Company

According to the annual report of the American Power & Light Company, New York, N. Y., for the year ended Dec. 31, 1913, the combined earnings of its four controlled companies, the Kansas Gas & Electric Company, Portland Gas & Coke Company, Pacific Power & Light Company and the Southwestern Power & Light Company, were $5,864,165, an increase of 9.7 per cent over those of 1912. The total net earnings were $2,678,831, an increase of 12.6 per cent over those of 1912. The earnings for the year from electric light and power constituted 55 per cent of the gross earnings; artificial gas, 30 per cent; natural gas, 8 per cent; railway, 4 per cent, and water 3 per cent.

The Pacific Power & Light Company, Portland, Ore., which, with its street railway service in Astoria, Ore., Walla Walla, Wash., and Milton, Wash., covers all the electric railway service of the American Power & Light Company except that offered by the Paris Transit Company, Dallas, Tex., reports gross earnings for 1913 of $1,288,059, as compared to $1,257,364 in 1912. Other income items were as follows: Operating expenses and taxes in 1913, $663,674; in 1912, $648,037; net earnings in 1913, $624,385; in 1912, $609,327; interest charges in 1913, $341,656; in 1912, $288,070; net income in 1913, $282,729; in 1912, $321,257; balance after dividends in 1913, $40,229; in 1912, $106,257. The gross earnings for the twelve months were divided as follows for the various classes of business: electric light and power, 66 per cent; railway, 13 per cent; artificial gas, 13 per cent, and water, 8 per cent.

The gross earnings of all the properties controlled by the Southwestern Power & Light Company, Dallas, Tex., which include the Paris Transit Company, for the twelve months ended Dec. 31, 1913, were $2,267,091, as compared to $1,927,127 in 1912. Operating expenses and net earnings in 1913 were $1,240,326 and $1,026,765, as compared to $1,076,550 and $850,577 in 1912, respectively. The gross earnings for this company were divided 80 per cent to electric light and power, 14 per cent to artificial gas, 4 per cent to water and 2 per cent to railway business.

Seattle Municipal Railway

The operation of the Seattle (Wash.) Municipal Railway for the month of June showed a loss for Division "A" of $380.73, and for Division "C" of $25.65. The revenues from Division "A" were $1,362.68, and the expenses, operating and construction, $1,743.41. For Division "C" the revenues from passenger and freight business were $1,652.84, and expenses, operating and construction, $1,678.49. These figures do not include the rate for power purchased from the municipal plant, as this has not yet been determined by the council. Another item to be considered in this connection is the interest for one month on $300,000 of bonded indebtedness of the line, Division "A."

The complete report for June, 1914, submitted by Superintendent A. T. Valentine of the Public Utilities Department follows:

Division "A"	
Revenues	$1,346.02
Operating expenses:	
Maintenance, roadway and track	$123.82
Superintendence of equipment	62.50
Superintendence of transportation	62.50
Passenger conductors and motormen	985.59
Carhouse employees	425.25
Total	$1,659.66
Division "C"	
Revenues:	
Passenger revenue	$1,611.18
Freight revenue	25.00
	$1,636.18
Operating expenses:	
Superintendence of transportation	$30.88
Passenger conductors and motormen	873.17
Freight conductor and motormen	17.18
Miscellaneous car service employees	104.06
Carhouse employees	18.29
Total	$1,044.21
Construction expenses:	
Division "A":	
Distribution system	$18.06
Carhouse construction	35.68
Cars	30.00
Total	$83.75
Division "C":	
Track laying and surfacing	$578.03
Distribution system	22.50
Lighting department	33.75
Total	$634.28
Advertising revenue:	
Division "A"	$16.66
Division "C"	16.66

It is reported that regardless of the action of the Federal Court, it is the intention of the city of Seattle to make physical connections between the tracks of city line and those of the Seattle, Renton & Southern Railway on Stewart Street between Third and Fourth Avenues. Under the terms of the common user agreement between the Puget Sound Traction, Light & Power Company, and the Seattle, Renton & Southern Railway on Fourth Avenue South, which it is expected will fix the terms of payment to be made by the city in the event all of the litigation is decided in the city's favor, the cost of the privilege will amount to about $7,800. Whenever common user rights are granted the receivers of the Seattle, Renton & Southern Railway will insist that the city general fund guarantee the payment of this amount annually.

Philadelphia & Western Railway

The gross earnings of the Philadelphia & Western Railway, Upper Darby, Pa., for the eleven months ended May 31, 1914, were $338,281. The operating expenses were $191,089, leaving net earnings of $147,192. After deductions of $10,400 for taxes, $125,228 for interest and $956 for miscellaneous items, there remained a surplus for the period of $10,608. According to the balance sheet of the company the road and equipment value was $8,476,943 and its treasury stock value $970,000, against which stand $6,000,000 of capital stock and $3,000,000 of first mortgage 5 per cent bonds.

According to a recent summary of its history issued by the company, the Philadelphia & Western Railway operates by third-rail a high-speed double-track railway between Philadelphia and Stratford entirely on private right-of-way, connecting with the subway system of the Philadelphia Rapid Transit Company and with the Pennsylvania Railroad at Stratford. It also operates a double track extension from Villa Nova to Norristown on private right-of-way, and maintains through service between Allentown and Philadelphia by means of the Lehigh Valley Transit Company's lines at Norristown via the Norristown Transit Company. Express cars are operated from Philadelphia to Allentown under an arrangement with the Adams Express Company, and direct connections for interchange of carload freight with the Pennsylvania Railroad are made at Philadelphia and Stratford and near Norristown.

The authorized and outstanding capital stock of the company amounts to $4,000,000 of common and $2,000,000 of 5 per cent preferred, cumulative after Jan. 1, 1916, par $50. Of an authorized bonded debt of $4,000,000, there is issued $3,000,000 of first mortgage fifty-year gold 5's, dated July 1, 1910. Of this amount $2,030,000 is in the hands of the public. The old mortgage of the Trust Company of America, New York, covering an authorized issue of $20,000,000, is cancelled.

Alton, Jacksonville & Peoria Railway, Alton, Ill.—H. A. Strauss, consulting engineer, Chicago, has been retained by the bondholders' committee of the Alton, Jacksonville & Peoria Railway to prepare a complete valuation of the company's property. This valuation report is to be submitted to the Illinois State Public Utilities Commission in connection with the application for the authorization of the reorganization of the company and the issuance of stocks and bonds thereunder.

Buffalo & Williamsville Electric Railway, Williamsville, N. Y.—After hearings before Public Service Commissioner Hodson, the purchase of the property of the Buffalo & Williamsville Electric Railway in Batavia, N. Y., by the Batavia Traction Company has been authorized by the commission. This proposed purchase was referred to in the ELECTRIC RAILWAY JOURNAL of Jan. 31 and May 9.

Chicago (Ill.) Railways.—The directors of the Chicago Railways have declared a dividend of $8 on Series 1 participating certificates, payable on Aug. 1 to holders of record of July 20. No action has been taken as to the second dividend on Series 2 participating certificates, the initial distribution of $2 on which was made in February last.

Columbus Railway, Power & Light Company, Columbus, Ohio.—E. W. Clark & Company, Philadelphia, announce dividend declarations of 1¼ per cent on the preferred stock, series B, and on the common stock of the Columbus Railway, Power & Light Company, payable on Aug. 1 to shareholders of record of July 15. The stockholders of the Columbus Railway, Power & Light Company will hold an adjourned meeting at Columbus on July 29, at which action will be taken on matters of new financing in connection with the company. It is planned to issue $3,145,000 of prior preference stock to retire a similar amount of first consolidated mortgage forty-year 4 per cent gold bonds of the Columbus Railway, which mature on Oct. 1, 1939, this stock to be limited to 4 per cent dividends and to have preference over all other classes of stock; and to provide for an issue of $450,-

000 of 6 per cent Series A preferred stock, with which to retire a similar amount of outstanding first mortgage 6 per cent twenty-five-year gold bonds of the Columbus Electric Company, maturing in November, 1922. To provide for these issues the shareholders will take action on a proposition to increase the capital stock of the Columbus Railway, Power & Light Company from $11,550,000 to $15,145,000. They will also vote on a proposed issue of bonds of the Columbus Railway, Power & Light Company, to be known as first and refunding sinking fund mortgage 5 per cent gold bonds to an amount not exceeding $25,000,000 and to be secured by mortgage on the property of the company. The plan is to issue the bonds from time to time to pay for such additions, betterments and improvements as may be made by the company.

Detroit & Port Huron Short Line Railway, Detroit, Mich.—The Railroad Commission of Michigan has authorized the Detroit & Port Huron Short Line Railway to issue $603,000 of first mortgage 5 per cent bonds of 1900 for the retirement of $600,000 of bonds of the Rapid Railway due on May 1, 1915 and 1916, and $3,000 of bonds of the Port Huron, St. Clair & Marine City Railway due in 1920.

Hagerstown & Frederick Railway, Frederick, Md.—The Maryland Public Service Commission has approved the sale of the property of the Frostburg Illuminating & Manufacturing Company to the Hagerstown & Frederick Railway. The railway company has also been authorized to issue $50,000 of 6 per cent bonds with which to pay the purchase price of $35,000 for the property of the Frostburg Illuminating & Manufacturing Company and improve its plant. The bonds are to be sold to net the railway company not less than $45,000.

Joliet & Southern Railroad, Joliet, Ill.—The Continental & Commercial Trust & Savings Bank, Chicago, Ill., as trustee, has asked the Illinois Public Utilities Commission to sanction an issue of $1,500,000 of bonds by the Joliet & Southern Railroad.

Medway & Dedham Street Railway, Westwood, Mass.—The Medway & Dedham Street Railway, the successor to the Dedham & Franklin Street Railway, has petitioned the Public Service Commission for approval of an increase in its authorized capital from $35,000 to $58,000, the proceeds to be used for equipment and extension of lines.

Northern Illinois Electric Railway, Amboy, Ill.—The Northern Illinois Electric Railway has been sold under foreclosure to H. W. Hillison, S. L. Shaw and Reinhart Aschenbrenner, representing the bondholders. The sale was made under court orders in the office of Special Master in Chancery M. C. Keller of Dixon, Ill.

Ocean Shore Railroad, San Francisco, Cal.—The Railroad Commission of California has authorized the Ocean Shore Railroad to issue promissory notes as follows: Twelve notes totaling $6,365, thirty-two drafts amounting to $4,368 and eight notes totaling $21,552. They are to be used for the purchase of equipment. The railroad company does not expect to pay these obligations as they become due from earnings, but from the proceeds of an assessment recently levied on the stockholders. Of a total of $192,000 assessed the sum of $100,000 has already been collected.

Point Pleasant (N. J.) Traction Company.—New officers have been elected as follows for the Point Pleasant Traction Company: Carroll P. Bassett, president; H. M. Whitehead, vice-president; Frank C. Kimball, secretary and treasurer; Arthur Tepper, auditor, and H. E. Fenner, superintendent.

Port Jervis (N. Y.) Traction Company.—New officers have been elected as follows for the Port Jervis Traction Company: D. E. Mandeville, president; M. F. Maury, secretary and treasurer; W. E. Guthrie, general manager; William Rice, superintendent.

Springfield (Ohio) Railroad.—E. H. Rollins & Sons, Boston, Mass., are offering for sale at prices depending on maturities, to yield 5.4 per cent, $100.000 of Springfield Railway first mortgage 5 per cent serial bonds, dated May 1, 1914, and due Sept. 1, 1922 to 1935. Payment is optional on any interest date at 102 and interest. The bonds are in denominations of $100, $500 and $1,000 and are secured by first mortgage on the property of the Springfield Railway, the replacement value of which is appraised at $1,422,000.

Third Avenue Railway, New York, N. Y.—The Third Avenue Railway has made all preliminary arrangements for the purchase of the Pelham Park & City Island Railway from the Interborough Rapid Transit Company. It is understood that F. W. Whitridge, president of the Third Avenue Railway, will apply at once to the Public Service Commission of the First District for permission to reconstruct the line as far as the Bartow station. The line will also be extended to connect with the system of the Union Railway, which is one of the companies owned by the Third Avenue Railway.

United Railroads, San Francisco, Cal.—The date set for the first hearing in connection with the inquiry into the finances of the United Railroads by the Railroad Commission of California has been postponed from July 17 to July 20.

United Railways & Electric Company, Baltimore, Md.—The United Railways & Electric Company announced that the outstanding 5 per cent three-year collateral trust notes of the company, which matured on July 15, would be paid on maturity on presentation at the banking house of Alexander Brown & Sons, Baltimore.

Dividends Declared

Brooklyn (N. Y.) City Railroad, quarterly, 2 per cent.

Chicago (Ill.) Railways, $8, participating certificates, Series 1.

Lewiston, Augusta & Waterville Street Railway, Lewiston, Me., quarterly, 1½ per cent, preferred.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., quarterly, 1½ per cent, preferred.

Railway & Light Securities Company, Boston, Mass., 3 per cent, common and preferred.

Rio de Janeiro Tramway, Light & Power Company, Rio de Janeiro, Brazil, quarterly, 1¼ per cent.

Sao Paulo Tramway, Light & Power Company, Sao Paulo, Brazil, quarterly, 2½ per cent.

United Traction Company, Pittsburgh, Pa., 2½ per cent, preferred.

York (Pa.) Railways, $1.25, preferred.

Traffic and Transportation

United Traction Company Replies to Service Recommendations

The United Traction Company, Albany, N. Y., has filed its answer to the report and recommendations regarding service in Albany as made to the Public Service Commission of the Second District of New York by C. R. Barnes, electric railway inspector of the commission. The company denies that 13.26 miles of track mentioned in the report are in need of reconstruction or repair. With respect to points where cars will not pass at ordinary operating speed the company says that the installation of special work will do away with this difficulty.

In the matter of extensions the company says that the one on Arbor Hill to Watervliet Avenue and that through New Scotland Avenue are not justified. The Arbor Hill extension is regarded as impractical by the company until the ravine west of Quail Street is filled in. The New Scotland Avenue-Woodlawn extension is in controversy on account of the fact that a route has not been agreed upon. The company, however, says that both extensions will in all probability be made in time. The proposed extension to connect tracks in Trinity Place with those in Hamilton Street is one the company has had in mind itself for some time. The construction of curves in both directions on the east side of Pearl Street to connect with tracks in State Street is regarded as unnecessary because they could not be used to advantage.

The company denies that it has inadequate snow fighting equipment. It has a snow plow for each 5½ miles of track and a sweeper for each 9 miles of track, all in proper working order. The company also declares the motor equipment of the snow plows and sweepers to be adequate.

Criticisms of additional service are dealt with under the heads of West Albany, Delaware Avenue, A Belt line, North Albany, Arbor Hill-Kenwood, Rensselaer, Troy. The company claims that from inspectors' counts it is already providing many more seats than there are passengers during the rush hours and during the non-rush hours about three seats to every passenger. In the matter of its service for church and theater patrons the company says that inspectors count the number of persons who get off cars at such places and an adequate return service is arranged accordingly.

The recommendation of Mr. Barnes that a transfer be issued upon a transfer to persons going to and from West Albany from points in Pine Hills does not meet with the approval of the company on the ground that to issue a transfer upon a transfer would lead to abuses of the system. The recommendation that transfers to and from cars of the Schenectady Railway Company operating within the city limits be issued, is also objected to by the company, which says that such transfer would interfere with interurban traffic. Plans under way for an improved terminal at the foot of State Street, will do away with all need of suggestions for rerouting the Albany-Troy red line cars.

In regard to the rearrangement of passenger stops suggested by Mr. Barnes the company says that in 1911 it discontinued 187 stops with a view of quickening the service. The plan met with so much disapproval that most of the stops had to be restored.

The company says that the recommendations to replace the 18 ft. and 20 ft. cars with more modern equipment and to retire open cars are unreasonable. The criticism that the 800 type of car run on the A belt line is too heavy, the company thinks is trivial because the type of car is modern and well adapted to the service it renders. During the last three years the company has improved its equipment through the installation in the city of twelve cars that seat fifty-four passengers; twelve cars that seat forty-four; five cars that seat thirty; has rebuilt forty-one cars to seat twenty-eight; rebuilt six cars that now seat thirty. The company contends that its night service is more liberal than in most other cities.

The company has under way the construction of a new high tension transmission line between Watervliet and Mechanicville and is making arrangements to build a new transformer station on land recently purchased at Sheridan Avenue and Chapel Street.

The company denies the need of an additional braking system upon single truck cars which remain in operation after Nov. 15 next, says it will look into the need to install a telephone system along the various routes, and that the recommendation of illuminated signs for all cars is being complied with.

The recommendations of Mr. Barnes were published in the ELECTRIC RAILWAY JOURNAL of June 27, page 1478.

The hearing before the commission in regard to the report of Mr. Barnes was opened on the morning of July 15. After the preliminaries incident to the opening Mr. Barnes was cross-examined by Lewis E. Carr of counsel for the company. Mr. Carr characterized the report as a "grossly unfair one." In opening the hearing Chairman Van Santvoord of the commission said:

"We accept the inspector's report for what it is worth at this time. If his recommendations are not proper, if they are wrong in any instance we would like to have it pointed out to us. We stand by our inspector's report until it is pointed out that he is wrong. In regard to certain of these recommendations we infer from your answers to the commission that you propose to do some of the things that have been recommended."

Recommendations from Mayor Regarding Service in Pittsburgh

The resolution offered recently to the Pittsburgh Council by Councilman Dillinger to force the Pittsburgh (Pa.) Railways into receivership has been laid on the table indefinitely by a vote of six to three. Before leaving for a European trip on July 8, Mayor Joseph G. Armstrong sent the company a letter in which he set forth the policy of the city administration and its requirements for the betterment of passenger transportation. In the letter a number of suggestions are made to the company for improving service. An answer to this communication is expected from the company when the Mayor returns from his trip early in August.

J. R. Bibbins, engineer, Chicago, has been engaged by the law department of the city of Pittsburgh in an advisory capacity in connection with proceedings for the improvement of local transportation conditions in that city. This work has the support of the city administration, and through co-operative study of the various phases of the problem with the company an attempt will be made for an operative service standard for scientific rerouting in the terminal district and for the progressive rehabilitation of the property until an adequate physical condition is reached. Mr. Bibbins is associated with Bion J. Arnold, and participated in a previous Arnold investigation in Pittsburgh. He also was resident engineer for the Arnold investigation of transit problems in Providence and San Francisco and of steam railroad terminal development in Chicago.

Notice of Increase in Fare by Massachusetts Line

The Middlesex & Boston Street Railway, Newtonville, Mass., has given notice to the Public Service Commission of Massachusetts of a proposed increase in rate of fare, effective on Aug. 3, 1914, to 6 cents for every ride between any two fare limits, wherever situated, with an additional charge of 1 cent for every transfer issued. The commission has ordered the railway to give public notice of the increase ten days prior to July 20 by publication.

At present the company charges 5 cents for all rides between fare limits within Newton and Waltham, except that within limits of these two cities an additional charge of 1 cent is made for every transfer issued. The rate has been 6 cents upon the lines previously operated by the Newton & Boston Street Railway, without charge for transfers. The rate is 6 cents upon all other lines, except that the company issues for $2.50 each books containing fifty tickets, each ticket good in lieu of a cash fare of 6 cents between any two fare limits west of Newton Lower Falls.

The request by the company to be allowed to raise its tariff comes as a result of the recent dispute between the line and its employees, and the decision of a board of arbitration that the carmen are entitled to a 15 per cent raise and back pay from June 1, 1913. It is estimated that the award will cost the company about $25,000 for back pay and about the same amount each year in addition to the amount heretofore paid for wages.

The award of the wage arbitration board was referred to in the ELECTRIC RAILWAY JOURNAL of June 27, page 1472.

Newly Organized Employees' Mutual Benefit Association at Rockford

On May 8, 1914, the officers and employees of the Rockford & Interurban Railway and the Rockford City Traction Company, Rockford, Ill., met at the club rooms of the trainmen for the purpose of organizing the employees' mutual benefit association. A. G. Snell, superintendent of transportation of the companies, submitted data from other similar associations and outlined a plan of organization. The object of the association is to promote good fellowship among the employees and to aid its members while they are disabled by reason of sickness or injury, and at their death to contribute aid to their designated beneficiaries.

At the conclusion of these meetings a joint committee of twelve employees representing all departments, with Mr. Snell as chairman, was appointed to draft a set of by-laws and constitution and to arrange all details for a permanent organization. On June 22, at a meeting of all employees, this joint committee outlined the forms and blanks to be used, and submitted a set of by-laws and constitution, which was accepted. The committee was instructed to have these printed.

On July 6 a permanent organization was perfected. W. C. Sparks, general manager of the companies, will be permanent chairman of the board of trustees. The officers elected are as follows: President, A. G. Snell; vice-president, C. R. Simcox; treasurer, W. H. Lemons; secretary, H. D. Hollenbeck; trustees: transportation department, J. R. Wolf, A. G. Andrews and E. Furman; auditing department, H. D. Hollenbeck; electrical department, J. Kingsley; roadway department, B. T. Feeley and D. Lacey; electrical department, J. M. Quaintance and Ralph Short. All the officers are elected for a term of one year except the chairman of the board of trustees and the treasurer, who are to hold their respective offices as long as they continue with the railways.

Any regular employee of the Rockford & Interurban Railway or the Rockford City Traction Company more than twenty-one years of age and under fifty years of age (charter members excepted) who has been in the service for a period of at least thirty days is eligible to membership in the association, upon approval as to his physical condition by the authorized medical examiner of the association. There are to be two classes of members—A and B. Class A members will pay dues of $1 a month and Class B members 50 cents a month. Should the funds of the association ever be insufficient to meet its obligations the trustees are authorized to levy not more than three $1 assessments on Class A members in any one year and not more than three 50-cent assessments on Class B members. The sick benefits paid to the members of the two classes vary, as do also the death benefit. These payments are described in detail in the by-laws. The trustees are to invest the funds of the association in such securities as they may deem advisable.

The charter membership consisted of 145 out of a total of 250 employees. Applications are being made for membership daily. At the next meeting of the board of trustees plans for raising funds other than by dues will be considered.

Freight Franchise in West Chester.—The Philadelphia & West Chester Traction Company, Upper Darby, Pa., has received permission to haul freight in West Chester.

Accident on Minnesota Line.—Fifteen persons were injured on July 8 when a car of the Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company collided with a steam freight train near the northern limits of Faribault.

Disagreement on Illinois Traction Mail Contract.—The negotiations have been abandoned in connection with the contract which it seemed likely would be arranged between the post-office department and the Illinois Traction System for handling mail.

Firemen Debarred from Inside Running Boards.—Chief McDonough of the Boston (Mass.) Fire Department has issued an order commanding fire department members to refrain from riding on the left-hand running boards of open cars in violation of an operating regulation of the Boston Elevated Railway.

Joint Steam and Illinois Traction Freight Tariff.—The Louisville & Nashville Railroad has issued a joint and proportional freight tariff on classes and commodities between Mt. Vernon, Ind., Evansville, Ind., Henderson, Ky., Owensboro, Ky., and Louisville, Ky., and all stations on the Illinois Traction System. This was effective on July 16.

Coney Island Traffic Interrupted.—An accident in the substation of the Brooklyn (N. Y.) Rapid Transit Company at Sheepshead Bay Road and Van Sicklen Avenue resulted in the suspension of traffic over the principal lines of the company to Coney Island on July 12 at 10 p. m., lasting two hours. It is estimated that more than 100,000 people were inconvenienced.

Special Evening Rates.—The Southwestern Traction Company, Temple, Tex., has put in effect a schedule of reduced rates applying between Temple and Belton and intermediate points for all travel occurring after 6 p. m. The through rate from Temple to Belton and vice versa has been reduced from 25 cents to 15 cents. Reductions between other points are made accordingly.

Ohio Electric Railway Submits New Milk Schedule.—For the second time within a short period the Ohio Electric Railway has submitted a milk schedule for the approval of the Public Utilities Commission. The classifications in the first one were objectionable. The second contains an increase of about 10 per cent over the rate for handling ten-gallon cans, when five-gallon cans are used.

The Connecticut Mail Controversy.—Second Assistant Postmaster-General Stewart was quoted as follows on July 15 in regard to the discontinuance of the mail service by the Connecticut Company. "When the railroad is ready to reopen negotiations on the department's plans the matter may be taken up again, but the next move must come from the railroad. The department here is doing nothing in the matter."

Stopping Places Designated in Pittsburgh.—On account of complaints from automobile drivers, who claim that street cars often block their paths at cross streets, the Pittsburgh (Pa.) Railways has ordered white signs to be painted at each corner one car length from the corner and another for the trailer. In this way the public will know the proper place to stand in order to board cars and the front of the cars will not block passage at a cross street.

Increase of Wages on Illinois Road.—An agreement has been reached by which a 15 per cent increase will be made in the wages of trainmen on the Chicago, Ottawa & Peoria Railway. The men asked for a 20 per cent increase. L. E. Fischer, representing the company, and A. D. Burbank, of the Brotherhood of Interurban Trainmen, met in Joliet and with a third party, chosen by them, arbitrated the wage question. The increase dates back to Jan. 1, 1914.

Forgetful Excursionists.—On July 4 ninety-six parcels were lost by absent-minded patrons of the Detroit (Mich.) United Lines upon the city and interurban cars. Fifteen people left their coats behind. There were ten who did not remember their umbrellas. One mother left her baby's carriage behind. A boy forgot his ball and bat. Some man remembered the saloons were closed on the holiday, but left his bottle behind him. Another excursionist left the family lunch basket on a car.

New Fort Wayne & Northern Indiana Traction Time-table.—A new time-table has been issued by the Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind. It shows not only the complete passenger and freight train schedules, but also gives the steam and electric connections at all junction points and contains complete information regarding the through interline service between Ft. Wayne and Indianapolis. A notable feature of this time-table is an interurban map showing in detail nearly all of the lines in Indiana, Ohio and southern Michigan.

Electric Freight Service for Springfield Arsenal.—Electric freight service will soon be provided for the United States Arsenal at Springfield, Mass., over the tracks of the Springfield Street Railway, in place of present methods of shipping by teams and trucks. The connecting link between the armory and the Highland Division of the New York, New Haven & Hartford Railroad will be provided by the Springfield Street Railway, the service being made possible by recent track re-laying on State Street and the installation of special work with facilities for electric switch operation at various points. Coal, ordnance and other freight will be handled at a substantial saving in cost over present methods.

New Commutation at Ticket Rates at Rochester.—The New York State Railways filed with the Public Service Commission of the Second District of New York new rates effective on July 10. Ticket books each containing 600 coupons, each of a face value of 1 cent good for transportation (within one year from date of sale) between all points on Rochester lines, except between points within the city limits of Rochester, will be sold for $5 per book. This is a reduction. The time limit of fifty-four trip commutation tickets has been changed from the calendar month for which purchased to the date of the following month corresponding to that on which purchased. If there be no corresponding date in the month next following, the limit will be thirty days from and including date of sale.

Refrigerator Cars in Louisville.—The Louisville & Interurban Railroad, Louisville, Ky., gets its "refrigerator" cars iced for nothing, or, rather, gets paid for permitting them to be iced. Ice this summer is exceedingly cheap at Louisville in view of an ice war in that city and the people on the country lines are buying it in quantities. The company hauls great quantities of ice out early in the morning on what it calls its ice cars, which on the way back bring the milk from the surrounding country to the city. Going out, loaded with from seventy-five to 200 300-lb. blocks of ice, the cars are kept tightly closed and are therefore thoroughly chilled before they start on the return trip. Thus the produce and milk which are brought back to the city, a great deal of it iced at its point of origin, virtually has refrigerated cars.

New Uniforms on Illinois Interurban Line.—The Rockford & Interurban Railway and the Rockford (Ill.) City Traction Company have adopted a summer uniform for the trainmen, said to be unlike those used by other companies. The interurban motormen wore a striped blue and white over-all blouse and trousers similar to those used by other interurban lines, but the new uniform consists of a gray flannel shirt with soft collar and cuffs and the regular blue serge trousers. Trainmen are permitted to go without their coats provided they wear invisible suspenders. This uniform is neat, can be washed and kept clean, and is very cool during the daytime and warm at night, absorbing perspiration readily. The shirt is worn in blouse fashion. The trainmen wear a silk cap. Conductors have two bands of gold braid around the cap and motormen two bands of silver braid. The caps have a visor to shade the eyes.

"Safety First" Campaign Succeeding at Boston.—The first week of the "safety first" campaign at Boston, which is to extend throughout the present month, shows a marked diminution in the number and severity of accidents on the streets as compared with the first week of July in 1913. The Boston Elevated Railway reports that from the beginning of the month to midnight on July 8 the number of accidents of all kinds on the system was only 52 per cent of the number during the corresponding period of 1913. Most of the accidents resulted either in no injury or in minor physical damage, and only one fatality occurred. There has been only one collision of cars in which passengers were injured. Police department records show that this year there were only forty-three street accidents in the week compared with sixty-three a year ago, and of these two were fatal compared with nine in the 1913 period. The Boston City Hospital reports eighty-four accidents compared with 136 a year ago.

Transfer Inquiry in Brooklyn.—The Public Service Commission for the First District has ordered that a hearing be held to determine whether transfers shall be ordered between the Van Brunt Street & Erie Basin Railroad, 3 miles long, and the Coney Island & Brooklyn Railroad, the Coney Island & Gravesend Railway, the Brooklyn, Queens County & Suburban Railroad, the Nassau Electric Railroad and the Brooklyn Heights Railroad, or any two or more of them. According to the report of Joseph Johnson, chief of the transit bureau of the commission, transfers between the Van Brunt Street line and the Hamilton Ferry line of the Coney Island & Brooklyn Railroad were exchanged prior to June 10, 1914. The Brooklyn Rapid Transit interests, after acquiring the Coney Island & Brooklyn Railroad, suspended the exchange of transfers, on the ground that the territory was amply provided for by the Crosstown and Hicks Street lines. The company refused to restore the transfer privileges, and now the commission will inquire into the situation.

Personal Mention

Mr. W. W. Martin has been appointed secretary and treasurer of the Amarillo (Tex.) Street Railway to succeed Mr. Guy W. Fellar, who has been made second vice-president and purchasing agent.

Mr. L. R. Little, who has been master mechanic of the Dayton & Troy Electric Railway, Dayton, Ohio, has been appointed chief engineer of the power station of the company, to succeed Mr. Waldo Weaver.

Mr. H. F. Ferguson has been appointed master mechanic of the Dayton & Troy Electric Railway, Dayton, Ohio, to succeed Mr. L. R. Little, who has been placed in charge of the power station of the company.

Mr. R. J. Pike, who was purchasing agent of the Lehigh Valley Transit Company, Allentown, Pa., has become connected with the Mahoning & Shenango Railway & Light Company as secretary to Mr. R. P. Stevens, president of the company.

Mr. L. W. Johnson has been appointed superintendent of the Texarkana (Ark.) Division of the Southwestern Gas & Electric Company, to succeed Mr. C. H. Kretz. Mr. Johnson was formerly assistant superintendent at Texarkana. Before that he was connected with the New Orleans Railway & Light Company.

Mr. E. H. Rowell has been appointed claim agent of the Topeka (Kan.) Railway, to succeed Mr. M. F. Cosgrove. For the last two years Mr. Rowell has been secretary to Mr. W. C. Cartlidge, claim agent of the Rock Island System at Topeka. He was also with the Santa Fe Railroad for a year as stenographer and clerk.

Mr. E. C. Deal, whose appointment to N. W. Coler & Company, New York, N. Y., was noted in the ELECTRIC RAILWAY JOURNAL of Feb. 28, has been elected vice-president and general manager of the North Carolina Public Service Company and the Salisbury & Spencer Railway, Greensboro, N. C., to succeed Mr. J. P. Clark. Both of these properties are controlled by N. W. Coler & Company.

Mr. Thomas Gibson has been appointed purchasing agent of the Lehigh Valley Transit Company, Allentown, Pa., to succeed Mr. R. J. Pike. Mr. Gibson has been connected with railway work for the last twenty-two years. He served as master mechanic of the Philadelphia & Chester Railway for eleven years, as superintendent of transportation with the Montgomery Traction Company, West Point, Pa., for eight years, and was in charge of the real estate department of the Lehigh Valley Transit Company for three years.

C. F. COLE

Mr. Cornelius F. Cole, auditor of the Metropolitan Street Railway, Kansas City, Mo., who devised the method used by the company for cataloging the voters in the Kansas City franchise election, as described elsewhere in this issue, was born at Chanute, Kan., on July 21, 1874. He was educated in the city schools of that place and in the Chanute High School. After leaving school he taught in the district school in Neosho County in 1891 and 1892. In 1892 he entered the employ of the Cherokee Bank at Cherokee, Kan., as assistant cashier. In 1894 he was appointed to the position of secretary of the Mine Creek Coal Company at Pleasanton, Kan., a position which he held until 1896, when he resigned to enter the coal department of the Missouri, Kansas & Texas Railway. In 1900 he was promoted to assistant to the superintendent of construction, with headquarters at St. Louis, Mo. In 1907 he went to Kansas City where he was engaged as accountant by several large concerns. In April, 1909, Mr. Cole entered the auditing department of the Metropolitan Street Railway and was soon advanced to chief clerk. In 1910 he was made auditor of the company, which position he holds at the present time.

Mr. Thomas Hawken has resigned as general manager of the Rockland, Thomaston & Camden Street Railway, Rockland, Maine. Mr. Hawken has been with the company nearly twenty-two years under the presidency of Mr. George E. Macomber. He has built up the company into one of the most prosperous public service corporations of its kind in Maine. The system includes railway, electric and gas properties. Mr. Hawken began his career in 1880 on telephone line construction at Salem, Mass. In 1890 he entered electric railway construction work for the Edison General Electric Company. Mr. Hawken intends to take up active work again after a vacation. The Rockland, Thomaston & Camden Street Railway operates 28.5 miles of line between Rockland, Thomaston, Camden, Rockport and Warren. Included in the system of the company is a park of which Mr. Hawken has been in charge.

THOMAS HAWKEN

Mr. Phillip D. Laird has resigned as chairman of the Maryland Public Service Commission, the resignation to take effect on Aug. 1.

Mr. Phillip J. Kealy, accountant, engineer and appraiser, who in conjunction with Mr. L. R. Ash, city engineer for Kansas City, Mo., drafted the franchise ordinance known as the "Kealy-Ash plan," will become the representative of the company on the board of control of the Kansas City Railways. The Kealy-Ash plan was advanced as a substitute for the Jost administration draft providing for the extension of the franchises of the Metropolitan Street Railway for nineteen years, and the "Kansas City plan," which is in reality the "Kealy-Ash plan," went into effect in part on July 8, following the franchise election in Kansas City. Mr. Kealy was born in Bloomington, Ill., on July 2, 1884. He was educated at the Chicago High School, Lewis Institute and the University of Illinois. He entered the service of Mr. Bion J. Arnold, Chicago, in 1907 and continued with Mr. Arnold until Feb. 1, 1914. He then resigned to become the personal representative of Mr. Robert J. Dunham as special adviser to the receivers of the Metropolitan Street Railway, in which position he remained until with the acceptance of the Kealy-Ash plan by the voters of Kansas City he automatically became representative of the company on the board of control of the new company. Mr. Kealy assisted in the valuation of the property of the Consolidated Traction Company, Chicago; Chicago Suburban Railway; Southern Street Railway, Chicago; International Traction Company, Buffalo; Seattle (Wash.) Electric Company; Toronto (Ont.) Railway and the Chicago Telephone Company. He went to Kansas City on June 2, 1912, as the representative of the Arnold Company to appraise the street-railway property, and so satisfactory was his work that he was directed to value the property of the Kansas City Electric Light Company. During the recent franchise negotiations in Kansas City he acted as campaign manager and adviser to the workers in the field. As previously stated Mr. Kealy becomes by the terms of the franchise the company representative of the board of control of the Kansas City Railways, but pending the discharge of the receivers he will serve together with Mr. Robert P. Woods, the city's representative, as an arm of the federal court.

P. J. KEALY

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Coal Belt Traction Company, Linton, Ind.**—Incorporated in Indiana to build electric railways in Linton. Capital stock, $10,000. Directors: Joseph Moss, D. R. Scott and George A. Baughman.

***Lansing Connecting Railroad, Lansing, Mich.**—Incorporated in Michigan to build electric railways in Lansing. Capital stock, $50,000. George E. Hutchinson, secretary.

FRANCHISES

Benicia, Cal.—A. K. Bowen, president of the Benicia Land & Terminal Company, has asked the Council for a franchise to build an electric railway in Benicia. Application will soon be made to the Board of Supervisors to build an electric line over certain county roads. This is part of a plan to build an electric line to connect Vallejo, Benicia and Winters, via the Berryessa Valley. [E. R. J., July 11, '14.]

***Lindsay, Cal.**—J. R. Hayden, Lindsay, has received a fifty-year franchise from the Council to build an electric railway in Lindsay.

San José, Cal.—The San José Terminal Railway has received an extension of time until April 15, 1915, on its franchise in which to begin work on the line the company proposes to build from San José to a point near Port San José. Financial arrangements have been made whereby work on the extension will be begun soon.

San Diego, Cal.—The Bay Shore Railroad has received a franchise to build an electric railway from Ocean Beach across the channel of False Bay and along the Strand to Bird Rock Beach in San Diego. Work will be begun at once.

Pomona, Cal.—The Pacific Electric Railway has received a franchise from the Council for a line from Lordsburg to North Pomona to connect with the line to San Bernardino.

Stockton, Cal.—The Stockton Electric Railroad has asked the Board of Supervisors for a fifty-year franchise to extend its lines in San Joaquin County.

Carbondale, Ill.—The Murphysboro & Southern Illinois Railway has asked the Council for a franchise in Carbondale. This 7-mile line will connect Murphysboro and Carbondale. A. B. Minton, Murphysboro, is interested. [E. R. J., July 4, '14.]

Chicago, Ill.—The Chicago & Northern Interurban Railway will ask the Council for a franchise in Chicago and it will ask for a certificate of necessity and convenience from the Illinois Utilities Commission in Chicago.

Dixon, Ill.—The citizens of Dixon will on Aug. 11 vote on a proposition to give the Illinois Northern Utilities Company a franchise to build and operate an electric railway on North Crawford Avenue in Dixon from its present line to the city limits. The election was ordered by a recent ordinance passed by the City Council.

Hopkinsville, Ky.—The City Council and the Fiscal court of Christian County have been asked to offer for sale electric railway franchises, providing for a city system and interurban lines in the county. The leaders of the group of local capitalists back of the project are R. E. Cooper and John B. Bell, who will ask for no bonus.

Columbia, Mo.—F. S. Mordaunt, Chicago, has received a fifty-year franchise from the Council in Columbia and is negotiating with the Chicago & Alton Railway for a ninety-nine-year lease on the 50-mile branch of the Chicago & Alton Railroad which connects Mexico and Jefferson. It is proposed to transform the branch into an interurban line and make it the nucleus of a railway which will connect Jefferson City, Mexico, Fulton, Montgomery City, Columbia, Fayette and Glasgow. [E. R. J., July 11, '14.]

Kansas City, Mo.—The Metropolitan Street Railway has received a nineteen-year extension of time on its franchise in Kansas City.

Billings, Mont.—The Billings Traction Company has received a thirty-day extension of time on its franchise from the Council to improve its lines in Billings.

***Toledo, Ohio.**—Philip S. Willis, Toledo, and Charles Newell, Sandusky, have received a franchise from the County Commissioners to build a 2-mile electric railway from Auburn Avenue to Willis Avenue in Toledo. This line will not connect with the lines of the Toledo Railways & Light Company. It is expected that this company will at first furnish the new line with light and power.

Astoria, Ore.—The Pacific Power & Light Company has received a franchise from the Council to extend its lines in the east and west sections of Astoria.

Portland, Ore.—Owing to changes made in the proposed route of the Portland & Oregon City Railway Company's urban and interurban line, application has been made to the Council for an entirely new franchise which will allow the cars of the company to run on the downtown streets and north on the East Side to the city limits. The company has already been granted a franchise allowing it to enter the city on the southeast.

New Castle, Pa.—The New Castle Electric Street Railway has received a franchise from the Council to extend some of its lines in New Castle.

***Mitchell, S. D.**—O. E. Cassem, Mitchell, has asked the Council for a franchise to build a 4-mile electric railway in the northwest section of Mitchell.

Nashville, Tenn.—The Nashville Traction Company has presented to the Board of City Commissioners a schedule of the new lines it proposes to lay under the terms of its recently granted franchise and has asked for the Board's approval. Rails to the amount of 250 tons are on the way for use in the construction.

Fort Worth, Tex.—The Northern Texas Traction Company has received a franchise from the Council to extend the Summit Avenue line in Fort Worth about 1 mile.

Blacksville, W. Va.—The Morgantown & Wheeling Railway has asked the Council for a franchise to extend its line through Blacksville.

TRACK AND ROADWAY

Helena Street & Interurban Railway, Helena, Ark.—An extension on Porter Street to the city limits of Helena is being built by this company.

Fresno (Cal.) Interurban Railway.—Surveys have been completed between Fresno and Clovis, 10 miles, and about 2 miles of track has been laid from Fresno to Esmeralda Vineyard. J. B. Rogers, Merchants National Bank Building, San Francisco, president. [E. R. J., June 6, '14.]

Pacific Electric Railway, Los Angeles, Cal.—An agreement was signed recently between this company and the El Segundo Land & Improvement Company whereby the railway company obligates itself to complete the line from Hawthorne to El Segundo and have it in operation by Aug. 2.

San Francisco, (Cal.) Municipal Railway.—The Mission District Promotion Association's committee on streets, railroads and railway transportation, has formulated a plan to afford transportation facilities to the easterly slopes of the Potrero Nuevo hills and the surrounding district. It is proposed to build an extension of the Potrero Avenue branch line of the Municipal Railway, which will serve this entire section and act as a feeder for the main branches of the municipal system in San Francisco.

Connecticut Company, New Haven, Conn.—The Public Utilities Commission has granted this company permission to relocate its tracks in Derby Avenue from Ellsworth Avenue to the town limits in New Haven.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—An extension of the Washington Street line to Concord Avenue, thence to the Boulevard and back to Twenty-second Street in Wilmington is being planned by this company.

Chicago & Northern Interurban Railroad, Chicago, Ill.—Plans are being contemplated by this company for a line to connect the Fox Lake district with Chicago at Elston, Belmont and California Avenues in the northwest section of Chicago. [E. R. J., July 11, '14.]

Peoria (Ill.) Railway.—Plans are being made by this company to double-track Frye Avenue through the East Bluff section.

Manhattan City & Interurban Railway, Manhattan, Kan.—During the next six weeks this company will award contracts to build 2 miles of new track in Manhattan.

Southern Traction Company, Bowling Green, Ky.—It is reported that this company has ordered 15,000 tons of rails preparatory for the extension of the Bowling Green Street Railway.

Orleans-Kenner Electric Railway, New Orleans, La.—Right-of-way is being secured by this company between New Orleans and St. Charles. This 110-mile line will connect Kenner, New Orleans, Hanson City, Harriban and Shrewsbury. J. A. Bowman, New Orleans, president. [E. R. J., May 9, '14.]

North Louisiana Electric Railway, Shreveport, La.—Preliminary arrangements are being made by this company for the early construction of its 120-mile line to connect Monroe and Shreveport via Ruston and Minden. A. B. Blevins, Shreveport, president. [E. R. J., Jan. 17, '14.]

Lewiston, Augusta & Waterville Street Railway, Lewiston, Maine.—Plans are being considered by this company to extend its lines in Augusta.

Portland, Gray & Lewiston Railroad, Portland, Maine.—This company has placed in operation its 10-mile line between Portland and Lewiston.

Frederick & Brunswick Railroad, Frederick, Md.—Plans are being considered by this company to begin work in the fall on this line between Brunswick, Frederick and Jefferson. Oscar B. Coblentz, Frederick, chief engineer. [E. R. J., April 25, '14.]

Bay State Street Railway, Boston, Mass.—Work of laying double tracks from Cliftondale Square to Morton Avenue and Central Street in Cliftondale has been begun by this company.

Worcester (Mass.) Consolidated Street Railway.—This company is asked to consider plans to extend its June Street line and relay its tracks from Abbott Street to Newton Square on Pleasant Street in Worcester.

Detroit, Almont & Northern Railway, Detroit, Mich.—Nearly 11 miles of track has been completed by this company on the section of its line between Romeo and Almont, and surveys have been completed from Almont to Imlay City. F. W. Brooks, 12 Woodward Avenue, Detroit, Mich., president. [E. R. J., Dec. 6, '13.]

Grand Rapids (Mich.) Railway.—Work has been begun on the Madison Square railway extension from Hall Street south to Burton Street in Grand Rapids.

Mississippi Electric Railway, Columbus, Miss.—Preliminary arrangements are being made by this company to build an electric railway from Memphis, Tenn., to Columbus, Miss., and eventually extend it into Alabama through Pickens County, with Aliceville as the terminus. Headquarters: Columbus. F. W. Crisby, Columbus, is interested. [E. R. J., March 28, '14.]

Union Railway, New York, N. Y.—This company has bought the existing franchises for an electric railway from City Island Station to Belden Point, City Island, and work will be begun at once on the construction of the line. As soon as the consent of the property owners can be secured this company will extend its Willis Avenue line into Harlem.

Tri-State Railways, Toledo, Ohio.—This company has awarded a contract to A. C. Lingebach & Company, Chicago, for the construction of its proposed line between Hillsdale, Mich., and Pioneer, Ohio. Surveys have been completed on the line between Hillsdale and Pioneer and are now under way on the branch from Adrian to Jackson. Charles H. Heller, Hillsdale, is interested. [E. R. J., June 20, '14.]

Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.—An extension of the Mahoning Valley line to West Austintown, a distance of 5 miles, is being considered by this company.

Oil Belt Traction Company, Oklahoma City, Okla.—This company has sent representatives to recent meetings of commercial organizations along the proposed route to ascertain what action will be taken. Many favorable replies have been received. A meeting of secretaries of commercial organizations along the route was held in Oklahoma City on July 9. This railway will connect Fort Smith, Ark., and Shawnee, Okla., via Blackwell, Nowata, Newkirk, Miami, Grove, Tulsa, Westville, Stilwell, Muskogee, Henryetta, Okemah and Checotah. [E. R. J., June 13, '14.]

Toronto (Ont.) Railway.—This company has been ordered by the Ontario Railway Board to extend its line from Agnes Street to College Street in Toronto.

Pittsburgh, Harmony, Butler & New Castle Railway, Pittsburgh, Pa.—Plans are being contemplated by this company for an extension from Butler to Youngstown. It is planned to bring the line into Youngstown over the proposed viaduct at Lincoln Park, to follow Ook Street and cross the proposed Oak Street viaduct to Summit Avenue and reach Youngstown this way.

Chattanooga Railway & Light Company, Chattanooga, Tenn.—Right-of-way is being secured for a 2-mile extension from the Missionary Ridge to the Rossville short line.

Nashville (Tenn.) Traction Company.—Work has been begun by this company on Fifth Avenue in Nashville. G. B. Howard & Company, Nashville, engineers. [E. R. J., May 9, '14.]

Bryan & Central Texas Interurban Railroad, Bryan, Tex.—All necessary material has been purchased by this company for the electrification of the line from Bryan to College. It is planned to have this line in operation by Sept. 1.

Corpus Christi Street & Interurban Railway, Corpus Christi, Tex.—An amendment to its charter has been filed by this company in Corpus Christi, changing its name to the Corpus Christi Railway & Light Company.

Eastern Texas Traction Company, Dallas, Tex.—At a recent meeting of stockholders of this company a contract was agreed upon with the Stone & Webster Engineering Corporation to complete the construction of the Dallas-Greenville Interurban line. Under the terms of the contract the Stone & Webster company agrees to complete the entire line, including the laying and ballasting of tracks, erection of electric lines, construction of power stations and depots and to put the new line in condition for operation. The work is to begin at once under the direction of L. C. Bradley, assistant district manager of the Stone & Webster interests.

Fort Worth & Denton Interurban Railway, Fort Worth, Tex.—A meeting of the stockholders of this company will be held July 24 to formally transfer the right-of-way and other holdings to the Stone & Webster Engineering Corporation which will build and operate the line. As soon as the formal transfer has been made the company will begin building the railway and it is expected to have cars in operation in about a year. [E. R. J., May 30, '14.]

San Antonio, San José & Medina Interurban Railway, San Antonio, Tex.—Work on the interurban line between San Antonio and Medina Dam will be begun within the next few weeks. The company expects to complete the first section to Kirk before the new year. The line will extend from Kirk to Castroville, via Lacoste, thence to the division dam. J. G. Miller, San Antonio, general manager. [E. R. J., June 27, '14.]

Washington Electric Railway, Chehalis, Wash.—Three condemnation suits were recently filed in the Lewis County superior court by this company to secure the right-of-way for the extension of the old Chehalis & Cowlitz Railroad, recently taken over by the Washington Electric Railway Company, from Newaukum to Randle, which is now under construction. To date 1½ miles of the line has been graded and the laying of rails will begin shortly. A bridge is being built across the Newaukum River. The route of the extension is up the south fork of the Newaukum River.

Willapa Electric Company, Raymond, Wash.—Plans are being considered by this company to rebuild its tracks in South Bend from Water Street to the Kleeb Mill. The entire right-of-way has been secured for the new route.

South Morgantown Traction Company, Morgantown, W. Va.—A 16-mile extension to Fairmont is being considered by this company.

Morgantown & Wheeling Railway, Wheeling, W. Va.—A 55-mile extension is being contemplated by this company from Blacksville to Wheeling.

SHOPS AND BUILDINGS

Lethbridge (Alta.) Municipal Railway.—Plans are being considered by this company for improvements at its carhouses in Lethbridge.

Helena Street & Interurban Railway, Helena, Ark.—A new freight station is being built by this company at Pecan and York Streets in Helena.

Pacific Electric Railway, Los Angeles, Cal.—Plans are being made by this company to build at once a new passenger station at El Segundo.

Bristol & Plainville Tramway Company, Bristol, Conn.—C. H. Tenny & Company, Springfield, Mass., engineers, have prepared plans and specifications for an addition to this railway company's carhouses located on Riverside Avenue in Bristol. The addition will be 50 ft. x 90 ft., one-story with slag roof. It will contain concrete pits and other conveniences. The addition is being erected anticipatory to the purchase of new equipment of double truck cars.

City Railroad, Mount Vernon, Ill.—Work will be begun at once by this company on its carhouses in Mount Vernon. The structure will be 35 ft. x 70 ft.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—Plans are being made by this company to begin work soon on the construction of a new interurban depot at Ninth and Ferry Streets in Lafayette. The company also plans to build during the year new repair shops east of Lafayette. The Terre Haute, Indianapolis & Eastern Traction Company will use the new depot and pay a rental to the Fort Wayne & Northern Indiana Traction Company.

Mesaba Electric Railway, Virginia, Minn.—Work has been begun on the construction of this company's new carhouses in Virginia to replace the structure destroyed by fire last winter. The building will be one-story in height and have a capacity of twenty cars. It is estimated to cost about $20,000.

POWER HOUSES AND SUBSTATIONS

Fresno (Cal.) Interurban Railway.—This company has placed in operation its temporary power station in Fresno where the line branches off Fresno Avenue into the Esmeralda Vineyard. This temporary plant will serve until the new company concludes its contract with the San Joaquin Light & Power Company. J. B. Rogers, president.

Pacific Gas & Electric Company, San Francisco, Cal.—This company will install at its power house in San Francisco one 100-kw, 650-volt, six-phase, sixty-cycle, 600-r.p.m. rotary converter. This appratus was ordered quite recently from the Westinghouse Electric & Manufacturing Company.

Public Service Company of Northern Illinois, Streator, Ill.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for one 300-kw, three bearing synchronous motor generator set, consisting of one 300-kw 600-volt generator on common base and shaft with one 450-hp, two-phase, sixty-cycle, 2400-volt, 900 r.p.m. synchronous motor with one 7½-kw, 125-volt direct connected exciter.

Manhattan City & Interurban Railway, Manhattan, Kan.—During the next six weeks this company expects to build a new power house in Manhattan.

Meridian Light & Railway Company, Meridian, Miss.—Extensive improvements are being made at this company's power plant and new machinery is being installed. Two new boilers, one a 750-hp and another 1500-hp, will be added to the equipment of the plant. The new machinery and other improvements are estimated to cost about $50,000.

Pacific Power & Light Company, Astoria, Ore.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for two 500-kw, two-bearing synchronous motor generator sets consisting of two 500-kw 225-112 ½-volt three wire commutating pole generators, 500 r.p.m., mounted on common base and shaft with two 720-hp, three-phase, fifty-cycle, 2400-volt, 500 r.p.m. synchronous motors.

Bryan & Central Texas Interurban Railroad, Bryan, Tex.—New engines and generators have been purchased by this company and will soon be installed in the power house at Bryan.

Manufactures and Supplies

ROLLING STOCK

Greeley & Denver Railroad, Greeley, Col., expects to purchase two single-truck motor cars.

Rhode Island Company, Providence, R. I., has ordered fifty cars from the Laconia Car Company.

Toledo, Ann Arbor & Jackson Railway, Toledo, Ohio, has leased one 40-ft. Edison storage-battery passenger car from the Railway Storage Battery Car Company.

Central Vermont Railway has leased one 40-ft. Edison storage-battery passenger car from the Railway Storage Battery Car Company, to operate between Brattleboro and Millers Falls, Vt.

New Jersey & Pennsylvania Traction Company, Trenton, N. J., has ordered four 49 ft. 6 in. center-entrance, all-steel, interurban, arched-roof passenger cars from the Cincinnati Car Company, through W. R. Kerschner, its Eastern representative.

Chicago (Ill.) Surface Lines, noted in the ELECTRIC RAILWAY JOURNAL of July 4, 1914, as having issued specifications for 228 semi-steel, double-end motor cars, has ordered these cars, together with trucks and seats, from The J. G. Brill Company. The General Electric Company has received the order for motor, control and brake equipment, which includes 456 type GE-242 tap field motors with K-51 control and CP-27 air brakes.

TRADE NOTES

Curtain Supply Company, Chicago, Ill., has received an order to equip with Ring No. 88 curtain fixtures and Rex all-metal rollers the 100 cars which were recently ordered by the Pittsburgh (Pa.) Railways.

Diamond State Fibre Company, Elsmere, Del., has recently started making Disfico white board at its West Conshohocken Mill. This is an insulating board which will bend but not crack, and is manufactured in thicknesses up to ⅛ in.

Electric Storage Battery Company, Philadelphia, Pa., has received an order from the Puget Sound Traction, Light & Power Company for thirty-four "Ironclad-Exide" batteries of three cells each. These batteries are to be used for lighting the cable cars operated by the traction company.

ADVERTISING LITERATURE

Chicago Pneumatic Tool Company, Chicago, Ill., has issued Bulletin 34-N describing and illustrating its Class N pneumatic steam and power driven enclosed compressors.

Whiting Foundry Equipment Company, Harvey, Ill., has issued Catalog No. 110 describing in detail its various types of cranes. Among numerous illustrations shown of these cranes in actual service are views of electric work car trains employed by the Northern Ohio Traction & Light Company; New York, Westchester & Boston Railway; Los Angeles (Cal.) Street Railway and of an electric locomotive train used by the Union Carbide Company, Niagara Falls, N. Y.

Salomon Brothers & Hutzler, New York, N. Y., have issued a 46-page pamphlet dealing with the subject of short-term securities. The book contains a list of securities arranged according to their maturities so that if the investor has surplus funds to invest for a stated period he can readily find the securities best suited for his purposes. Among some of the public utility issues included in the list are the following: Brooklyn Rapid Transit Company 5's, Chicago Elevated Railway 5's, City Service Company 7's, Denver City Tramways 5's, Delaware & Hudson Company 4's, General Electric Company 5's, Montreal Tramways & Power Company 6's, Pacific Gas & Electric Company 5's, Portland Railway, Light & Power Company 5's, Public Service Corporation of New Jersey 5's, Puget Sound Traction, Light & Power Company 6's, Republic Railway & Light Company 5's, United Gas & Electric Corporation 5's, West Penn Traction Company 6's and Westinghouse Electric & Manufacturing Company 5's and 6's.

NEW PUBLICATIONS

Trolley Wayfinder. Published by the New England Street Railway Club, Boston, Mass. 151 pages; price, 10 cents.

This is the official guide to the electric railways of New England published by the New England Street Railway Club. The information is most conveniently arranged and is supplemented by many maps of the individual systems and group maps which show the possibilities of long excursion tours.

So the People May Know. Published by the Blade Printing & Paper Company, Toledo, Ohio. Fifty-two pages and cover; price, $2, postpaid.

This is a reprint of a series of advertisements written by Henry L. Doherty, of H. L. Doherty & Company, New York, N. Y., for the Toledo Railways & Light Company in connection with the negotiations for the extension of the franchise of that company, and published in the newspapers of Toledo. The advertisements deal with the general franchise situation in Toledo and contain the answers prepared by Mr. Doherty to the criticism leveled at the company from various sources.

Workmen's Compensation. By James Harrington Boyd, A. M., Sc. D. The Bobbs-Merrill Company, Indianapolis, Ind. Two volumes, 995 pages, $7.50.

These volumes are a complete presentation of the subject of workmen's compensation and industrial insurance, setting forth the methods, procedure and results in actual practice and including the full text of the statutes in force Jan. 1, 1913, in Germany, England and the several states in this country. The author points out in a clear-cut manner the distinctive characteristics of the different remedies for the relief of injured workmen—that is, the common law remedy, employers' liability laws, workmen's compensation laws and industrial insurance acts. He presents the economic effects of the operation of these laws from a social, political and ethical point of view, shows their historical evolution in this country and abroad and analyzes their constituent elements. He also devotes considerable space to a discussion of the fundamental legal principles that form a basis of the various kinds of laws and describes in detail the administrative machinery that has been developed to operate these laws in this country.

Volume 1 is taken up with a presentation of the distinctions between compensation remedies, a history of the development of workmen's compensation laws in Germany and the United States and an analysis of the compensation acts in New York, Montana, Washington, Ohio, Wisconsin, New Jersey, California, Nevada, Kansas, New Hampshire and Massachusetts. In discussing the acts of these states the author gives the construction and annotations of the state board or commission which has in charge the administration or execution of the law. This volume also contains a discussion of the legal principles underlying compensation laws and a summary of all foreign compensation laws.

The first part of Volume 2 presents an analysis of the acts for Illinois, Minnesota, Rhode Island, Arizona, Missouri and the federal government. The treatment of the subject thus far has generally been confined to separate compensation acts, but at this point the author groups all the laws and begins to consider matters and constructions common to them all. He discusses the character of workmen included under the laws, the injuries for which compensation is allowed, the question of whether the employee was injured in the course of his employment, the time when injuries were received, dependence of deceased workmen and amount of compensation. The minuteness with which this examination is made is evidenced by the fact that cases are cited on almost every page of this section to prove such statements as these—that compensation allowed for engineers who work "on, in or about" a railway does not cover injuries received in a refreshment room, for this is not used for the purpose of public traffic within the meaning of the law, and that an employee of contractors to build a railway station does not come within the purview of the law, as this work is merely ancillary to the operation of the railroad. In the last portion of Volume 2 there is an account of the procedure under the British compensation act and also the only complete translation of the German industrial insurance code, which is the parent law upon which American legislation is based. The book is not written primarily for electric railways, but it is an exhaustive mine of information for every employer concerning a movement that is becoming daily of greater importance in this country.

KEEPING TRACK OF GOOD DATA

Those who consult the page containing the table of contents of this paper, the page just inside the front cover, will have noticed a change in arrangement beginning with this volume. Heretofore this page has been purely a list of the articles in each issue. It is now not only a table of contents but also can be used as a basis for a card catalogue of the leading articles and so serve for the temporary convenience of the reader until the semi-annual index is published. Before the change was made a number of librarians and others were consulted, and it is at their request that it was done. No attempt is made on this page to arrange the titles so as to bring the keyword first in each case. This, it was thought, would confuse the reader who wished to use the page as a table of contents. Moreover, some readers will wish to use one keyword and some will prefer another. The present plan permits the keyword under which the card index is to be alphabetized to be underscored easily when the clipping is filed. A list of a number of the standard keywords used in the regular indexes of this paper was published on the inside of the first page of the semi-annual index. All who wish to follow our general plan of keywords will find this list useful.

MAKING USE OF THE ANNUAL REPORT

Annual reports of public service corporations and, in fact, corporations in general, are usually sad affairs. They appear to be compiled with a view to communicating such information as is given in the least interesting form. This is not only an example of unwisdom but of throwing away an opportunity for effective educational work. An annual report need not consist merely of pages of figures representing more or less understandable accounts. It may, with good effect, tell in an interesting way a year's history of a corporation, what it has been doing and what it has accomplished. In most cases the report can be effectively illustrated. It also affords an excellent opportunity for the discussion of public relations. Statements in annual reports on such subjects carry more weight and make more impression than ordinary declarations on the subject. At the present time the press has no reason to pay much attention to corporation annual reports, but if these reports were prepared as they might easily be with a view to making them interesting and informing along general lines, not only the stockholders but the press and the public generally would pay attention to them, and they would become a useful medium for public education.

VALUE OF CONVENTION EXHIBITS

At this season plans are being made by manufacturers for the exhibits to be made at the Atlantic City convention. Each exhibitor has his own idea as to what constitutes a satisfactory presentation of his product. At the same time there are certain fundamental requirements which it is well to keep in mind. There must be something about the exhibit which attracts visitors to it, not because of some irrelevant "stunt" which is being "pulled off" but because it offers a chance to teach something. The exhibit must be of an instructive character so that the visitor leaves with a feeling that he has been put upon the right track on some matter vital to his welfare. Such exhibits require effort, especially in formulating the original, basic idea. The most original, studious and resourceful man in each business organization should be assigned to this part of the work. Visitors to former conventions could do good service to exhibitors by stating in our "Communications" column some of the exhibit features which impressed them.

THE DAYLIGHT SHOP

Some recent designs of electric railway shops and carhouses show a commendable appreciation of the value of daylight. The old-time buildings were usually constructed with massive brick walls and heavy wooden roof timbers, and for these wide areas of glass were often impracticable. Modern steel and reinforced concrete construction has made it feasible to put up structures which from the glazing standpoint may be likened to exaggerated hothouses. At the same time the manufacture of sash-operating devices and fire and shock-resisting glass have been brought to such a high stage of development that daylight construction is both convenient and safe. Perhaps the most striking of late electric railway installations is the new machine shop of the Detroit United Railway, which was described in our issue of June 13. It appears that the exterior construction of this building was influenced very largely by the designs of the structures put up for the great automobile companies of the City of the Straits. Certainly if manufacturers who require buildings several stories in height can find ways of obtaining ample light, the electric railway company, which rarely requires more than a one-story building, should not be backward in securing the same advantages. Unless a shop or carhouse is of extraordinary breadth with narrow devil-strips there is no excuse for dark pits in the daytime. A well-lighted building also means greater safety for the employees and more effective, even if unconscious, attention to keeping the floors clear of debris and fire-breeding waste and oil. The latest carhouses built in Germany are noteworthy models in this respect. Although they are not generally designed with large glazed areas in the walls, they do have very liberal skylights and the ends, including a large portion of area of the track doors, are usually of glass.

ABSORBING FRESH BLOOD

This is the season when there is a large accession from the schools to the ranks of the workers. Within the past few weeks several hundred thousand young people have been "graduated" from schools and colleges and must now be absorbed by the industries. A considerable number will naturally enter electric railway work. The problem of assimilating a reasonable share of the best available young blood is a serious one, because on its solution depends the future of the industry. There are two aspects of this situation which demand attention. The recruit must begin his work with the determination to make the most of it and of himself. On the other hand, the employer must see to it that the youth has a fair opportunity to make good. It is this second point that appeals to us as particularly important at this time.

The process of adapting young people to their proper places in many of the industries is more complicated now than formerly. Then the demands on the school were few and simple and the learning of a trade was a natural step, as apprentice systems of one kind or another were more generally in vogue and effective. A mechanic, for example, complied with more or less definite specifications and occupied a recognized position in the community. In contrast with former conditions we have at present a complicated school curriculum, which is the subject of much criticism, and a general lack of provision for systematic training in the industries, especially on the part of operating companies. There is for these reasons a new responsibility laid upon the management of such companies to study the "new blood" problem. The fundamentals of this study appear to us to be as follows:

The educational and industrial facts cited above must be recognized. Each applicant for a position must be considered as an individual, not simply as "help," and his qualifications must be studied to enable him to be fitted to the proper task. When set to work he must not be left to his own devices but must have some guidance so that he will develop properly and can utilize all present agencies for his improvement. Original devices must be used as necessary to bring out the latent ability of the neophyte. We can imagine that we hear our older friends, brought up under the good, old-fashioned but now obsolete methods, throwing down the paper at this point, exclaiming, "Bosh! throw the youngster in and let him learn to swim by swimming. This new-fangled coddling business doesn't go with me." We urge these friends to be patient with us. Times have changed. We must have something to do for the boy what the old apprentice system did. We do not advocate coddling but we do deplore neglect.

MAKING THE "SAFETY FIRST" MOVEMENT PERMANENT

Accident prevention campaigns are so much in vogue to-day that they present little novelty to the progressive electric railway man. Nevertheless, every carefully planned campaign in the interests of "safety first" deserves commendation, for such efforts are honest endeavors to cut down the waste, losses and suffering of humanity in a field very much within the control of each individual. The Boston campaign, described elsewhere in this issue, is one of the most thoroughgoing of its kind. The division of the work into six periods, each of which was featured by a keynote poster for dasher service, amplified by signs within cars, stations and elsewhere, unquestionably served to retain public interest in the campaign during its continuance. The figures at its end will be highly instructive as indices of the degree to which the public and the railway employees concerned manifested a real interest in their own welfare and co-operated with the company in its efforts to impress them.

It is of very great importance, once a "safety first" campaign has been waged in a city, that all the lessons shall not be forgotten when the period of publicity is over. As in many other reforms, the avenue of approach most likely to lead to success is the child. Within the Boy Scout movement, in the public schools, in the Y. M. C. A. organization, accident prevention finds a naturally cordial reception, and the idea of making children think of themselves as "street scouts," looking out for the safety of others, is an excellent one. We are inclined to think that if "safety first" work is to continue in any community, the subject must constantly be kept in sight, although revivals of interest in it must be stimulated from time to time by special efforts on a striking scale. The subject is not unlike that of modern advertising, which, to be most effective, calls for varied displays and fresh copy no less than for regular, steady insertions of the appeal.

It is not difficult to keep employees in touch with safety work, but it is far from easy to keep the public from dropping back into the old, careless ways, once a campaign is past. On every large and on most small systems, there is ample material upon which to draw in seeking to show the public what to avoid. That is to say, every accident has a lesson of its own, and so great is the variety of ways in which accidents can happen that special features of the safety movement can be emphasized for many months without giving the people monotonous repetitions of the subject. Out of the daily experience of every representative operating company may be drawn lessons which, when pressed home in the sign racks and elsewhere, should yield much good fruit in the way of individual care to avoid danger. But in the long run, the physical salvation of the individual in relation to the safe use of the streets depends upon himself, and accident prevention from the street railway point of view is in no small degree a matter of supplying the public with the right kind of impressions, appealing to it in English and other languages with statements and arguments of real, human significance, practical, concrete and pithy, and with fresh angles of attack on the inertia and mental conservatism from which we all suffer in varying degree. The material is at hand and its successful use depends upon the operating man, the claim department and upon every employee authorized to devote a part or all of his time to this worthy cause.

COMPARATIVE MAINTENANCE COSTS FOR CAR EQUIPMENT

The maintenance costs on the Hudson & Manhattan Railroad, which appear on another page of this issue, possess a feature of interest beyond the fact that they establish the best record of operating cost yet published. This is because the figures are, in a way, generally comparable to those of the New York, Westchester & Boston Railway which were published in our issue of March 21, and in consequence they serve as an indication of the relative operating results that can be obtained from efficiently operated single-phase and direct-current railways. On the Hudson & Manhattan, the service, with 1.6 stops per mile and heavy grades, is somewhat more severe than on the Westchester road, but to offset this the latter's cars are heavier and a car mile involves the transportation of a greater tonnage. Other conditions, however, display a striking similarity, both roads having been equipped by the firm of L. B. Stillwell, which acted as consulting engineers, and this is reflected in the almost exact agreement of many of the items in a comparison of the subdivided operating costs.

Such agreements will be found in the cost per mile of the control equipment, the trucks, wheels and axles, and the brake equipment when the cost of material, which is not subdivided by the Hudson & Manhattan, is prorated among the various items. Approximately speaking, the cost of maintenance on the Westchester is 2.3 cents per mile and on the Hudson & Manhattan 1.5 cents per mile. Leaving out of consideration the irregularly charged cost of painting, one-third of the total difference of 0.8 cent per car mile is involved in the maintenance of the single-phase motors. However, the Westchester motor costs were increased by the repairs on motors damaged in the early days of operation which were not charged until January, 1913, and if these charges are omitted the cost of motor maintenance is reduced to 0.11 cent per car mile. It will be noted that the main motors on the Hudson & Manhattan cars cost almost nothing for repairs, so that, on account of this unusual condition, practically all of the expense goes against the record of the single-phase equipment. The difference in the cost of maintaining the auxiliaries amounts, roughly, to 0.15 cent, and this, of course, is easily traceable to the fact that on the Hudson & Manhattan cars only the air compressor and governor are included in this item, whereas on the Westchester cars there is, in addition to the air compressor, a blower, a transformer and a motor-generator set for charging the control batteries. Besides these items there is a cost for maintaining pantographs on the Westchester, amounting to about 0.15 cent per car mile, which is not offset by any corresponding charge on the Hudson & Manhattan where the cost of third-rail shoes, since the adoption of the present spring-held type, has become too small to be recorded. In the same way gears and pinions, under the vibrating torque of single-phase motors, cost about 0.05 cent per car mile on the Westchester while those on the Hudson & Manhattan cost practically nothing.

So far as reliability of the two forms of equipment goes, there appears to be little to choose. On the Hudson & Manhattan, leaving aside the record of the exceptional year 1911, when the miles per detention rose to the extraordinary figure of 160,000, the average delay record is very close to 55,000 miles per detention or 22,000 miles per minute of detention. On the Westchester the corresponding figures are respectively 41,000 miles and 13,000 miles, the difference being easily accounted for by the fact that the latter line runs almost entirely in the open, whereas the former is mainly operated in a tunnel.

The mileages obtained from main motor brushes are respectively 26,000 and 21,000, showing that there is little to choose between the two types of motor in this regard. Indeed, this would indicate that the wear upon the commutators is approximately the same in both cases, although judging by the appearance of the commutators at the present time the Hudson & Manhattan seems to have a considerable advantage in this respect. The cost of lubricant on the Hudson & Manhattan averages but 14 cents per thousand car miles as against 21 cents on the Westchester. Probably a considerable part of this is due to the increased amount of equipment on the single-phase cars, and there is no doubt but that some portion is due to the difficulty of oiling bearings and gears that are under the vibrating strains inherent in single-phase equipment, but in the end the item is one of small relative importance, and it is unquestionably affected to a large extent by the number of cars cared for.

This matter, of course, must be admitted as a factor of considerable influence in every item where irregularity of work is inevitable, such, for instance, as terminal inspection, and as the Hudson & Manhattan is operating 286 cars as opposed to thirty on the Westchester the advantage is all with the former road. Of course, this comparison of the costs of maintenance on the two roads in question is not intended to extend beyond consideration of the two radically different types of equipment which are involved, and it should not be construed in any way as criticism of the methods employed or the results obtained by P. V. See and R. R. Potter, the superintendents of equipment on the two roads respectively. Indeed, opportunity for a comparison of costs on the two types of equipment has been made possible by the highly efficient manner in which the cars on both roads have been maintained, and our comments are congratulatory rather than critical in view of the excellent results that have been accomplished.

Open Cars Changed to Closed Center-Entrance

The Portland Railway, Light & Power Company Has Rebuilt a Number of Open Cars to a Center-Entrance Type with Folding Double Step—Among the Most Striking Features Are the Swinging End Seats and In-Sweeping Side Doors

The Portland (Ore.) Railway, Light & Power Company has converted a number of its open-type cars to the center-entrance closed-body design shown in the accompanying half-tones and drawings. Several of these cars are already in service on the Hawthorne line. The rebuilt cars are 42 ft. 7 in. over all and 7 ft. 6 in. wide with a 47½-in. center opening. Separate doors and single folding steps are provided for the motorman.

The accompanying plan shows that cross seats are used to the largest extent consistent with freedom of passenger movement. The end seat which occupies the space otherwise used by the motorman is of special interest. It is suspended on levers at either end, thus forming a swing. As the seat is journaled to rotate, it may be rolled over automatically by means of corner rollers. The slotted guides in which these rollers travel are fastened to the sides of the car and serve to support the seat in its lowered position. To clear the motorman's cab the front edge of this seat is raised, thus allowing it to swing in and also allowing a pendent intermediate seat to drop over the aisle in direct line with the first pair of permanent cross seats. This pendent seat and the regular cross seats then form a

PORTLAND CONVERTED CAR—WIRING FOR STEP AND DOOR SIGNALS barrier between the operative cab and the rest of the car. To bring the seat into use at the rear idle cab, the front edge of the aisle seat is raised slightly and started back, the seat continuing to fall by gravity as it is slightly out of balance. Other temporary seating is used at the center opening alongside the non-operated doors. The total seating capacity of the car is fifty-seven.

A double step, involving the easy successive elevations of 14 in., 13 in. and 12 in., is used between the street paving and the car-body floor. This double step is arranged to fold under the side sill to avoid fouling vehicles or other obstructions. It is of unusual construction in that one riser serves for both steps. Hence the riser folds over just as if a single step was used.

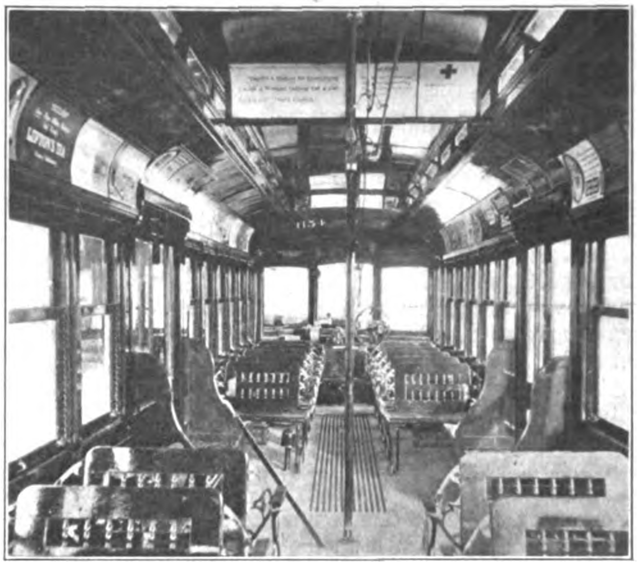
PORTLAND CONVERTED CAR—SWING SEAT USED AT END OF CAR—DOOR AND STEP MECHANISM

The inter-operative door and step mechanism is controlled by the conductor. Owing to the use of a spring on each side of the center balance of the double step, the only friction which resists the movement of the lever amounts to but 7½ lb. at the conductor's grip.

Unlike most folding doors, those used on these cars are not hinged to swing in or out. At its center each door hangs from an arm which extends from a vertical shaft, a screw on this arm serving for ready adjustment. The movement of the door is governed at the outer edge by means of a roller which runs in a slotted guideway over the door. This guideway is so shaped that the door in closing must pass behind any passenger who may be standing within the doorway. Should the passenger be within the sweep of the door, the movement of the latter would force him in and not out, contrary to the action of a hinged door. This action is represented in an accompanying drawing, which shows that a passenger who may be leaning against the center grab post would not block the movement of the Portland door, whereas he would interfere with a hinged door if he was standing 2 ft. within the car. For practical purposes the new door takes less than one-half the room of a swing door.



PORTLAND COVERTED CAR—INTERIOR VIEW, WITH TEMPORARY AISLE SEAT IN BACKGROUND

Another drawing shows a wiring diagram of the signal system, illustrating the connections to the motorman's pilot signal light, the conductor's signal, the switches for breaking the circuit if either door is opened and the bank of dash sign lights. This bank is incased in a box-like reflector to which a "car full" sign is hinged. When this sign is "down" it is brightly illuminated, while the dash sign is kept in shadow; when this sign is "up" its legend is invisible but the light from the bank is reflected downward to illuminate the dash sign.

The technical changes in the cars, as described, are being made under the direction of F. W. Hild, general manager, and F. P. Maize, master mechanic.

Maintenance Costs on Hudson & Manhattan Railroad

Detailed Figures Are Published to Show Costs and Other Operating Records on This Rapid Transit Line—The Average Cost of Maintaining 35-Ton Cars for the Past Four Years Has Been Less than 1.5 Cents Per Car Mile

As frequent comparisons of detailed costs of operation on railroads of similar character must ultimately lead to the adoption of apparatus, methods, shop facilities and policies which will produce the maximum reliability of service with the minimum of expense, the following costs of maintenance of car equipment on the Hudson & Manhattan Railroad have been obtained for publication by the ELECTRIC RAILWAY JOURNAL. In presenting these figures an effort has been made to set forth briefly, but as clearly as possible, the actual detailed costs incurred and the operating conditions affecting them.

The Hudson & Manhattan Railroad equipment is operated almost entirely in the Hudson Tunnel system, carrying the heavy commuting service of the Erie, the Delaware, Lackawanna & Western and the Pennsylvania Railroads under the Hudson River to and from New York City. The system comprises 16.9 miles of single-track tunnel. The average distance covered by each car in one day is 118 miles. In making this daily mileage each car encounters curves equal to about 42 complete round turns, the minimum radius of curves being 90 ft., and it ascends grades equivalent to a total elevation of 4685 ft., the maximum grade being 5 per cent. The brakes are used to control the speed in descending the corresponding down grades. The average schedule speed, including 1.6 stops per mile, is 17.32 m.p.h. Trains consists of from two to six cars as required.

The service in the tunnel itself, while free from extremes of temperature, subjects the cars to a humid atmosphere at about 65 deg. Fahr., and on account of the close clearances in the tube the cars always operate against the equivalent of a heavy head wind which has, at times, a pressure equal to 2 in. of water. This causes a considerable amount of dirt to be deposited in and on exposed apparatus, and it also requires the interiors of the cars to be kept unusually clean, as the dust raised by the drafts that are caused by the opening of a door would otherwise be annoying to passengers. As the yards and part of the service are in the open air the low temperatures experienced in winter when the cars are outside involve the same attention to prevent the freezing of the air-operated apparatus as if the service was constantly in the open.

The rolling stock in service consists of 173 motor cars. No trailers are used. All cars are steel, 48 ft. over all, 8 ft. 6 in. wide, 12 ft. high from rail to top of roof. The cars average 70,000 lb. in weight and seat forty-four passengers. Each car is fitted with two GE-76 d.c. motors, each rated at 170 hp at a line voltage of 600. The control equipment is General Electric, Type M, and the air brake is of the Westinghouse, A.M.L.E. type.

The Hudson & Manhattan Railroad was opened for regular operation in February, 1908. For the first three years the inspection of equipment was accomplished on an eight-car length of track, with a pit, at the Hoboken terminal station platform. All inspection was done by artificial light and in very cramped quarters. Necessary repairs during these years were done in the small shop on the surface at Hoboken, reached by raising one car at a time on an elevator. During the year 1910, 140 cars were thus cared for. However, a completely equipped repair shop was built at Jersey City and placed in service in December, 1910, by the firm of L. B. Stillwell, consulting engineers for the Hudson & Manhattan Railroad. This shop was specially planned to provide for the peculiarities of the equipment which it served, the cars having been designed by F. M. Brinckerhoff, a member of the same firm, so that an exceptional opportunity has existed for economical maintenance since the shop has been in use.

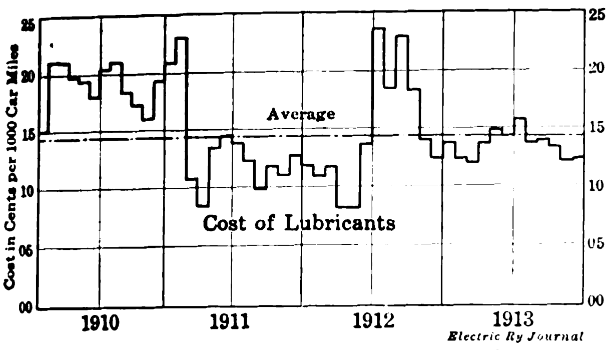
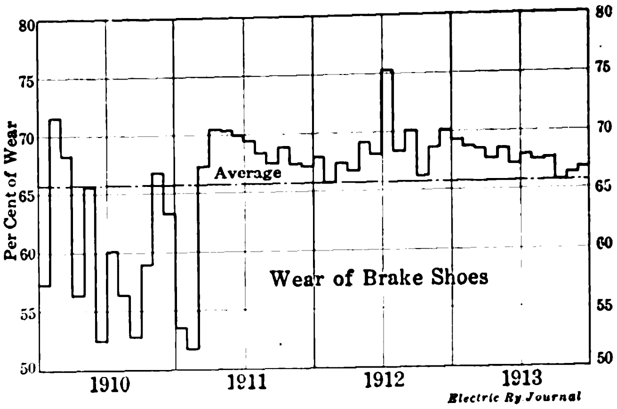
HUDSON & MANHATTAN MAINTENANCE—FIG. 1—CURVE SHOWING COSTS OF MAINTENANCE OF CAR EQUIPMENT DURING A FOUR-YEAR PERIOD



HUDSON & MANHATTAN MAINTENANCE—FIG. 2—COST OF MATERIAL FOR LUBRICATION



HUDSON & MANHATTAN MAINTENANCE—FIG. 3—BRAKE-SHOE MATERIAL UTILIZED IN SERVICE, EXPRESSED IN PERCENTAGE OF TOTAL WEIGHT OF METAL WORN FROM SHOES

As the repair work during the first three years was done under abnormal conditions, the cost of maintenance for only the last one of these years is included in the accompanying tables. However, during the four years for which records are given all of the work of maintenance has been continuously in the charge of P. V. See, superintendent of car equipment, Hudson & Manhattan Railroad.

HUDSON & MANHATTAN MAINTENANCE—MOTORMAN'S DEFECT REPORT CARD

In the accompanying Table I is shown the total costs of maintenance per car mile for four years, including supervision, repair, car painting, inspection, car cleaning and all shop tools and expenses, the average cost being 1.48 cents per car mile. In Fig. 1 is shown the plotting of the same total figures, a subdivision being made between inspection and repairs. The first heavy peak in the curve of Fig. 1 may be accounted for by changes made in the equipment and by the execution of certain repair work and painting which had been deferred until the new shops were occupied. The peak near the end of the curve is due to a very extensive painting of cars.

Table II is a subdivision of costs for six months, to show in detail how the money is spent. It will be noticed that the labor spent on inspection is comparatively high—over 0.5 cent per car mile, notwithstanding the remarkably low total costs. This is due to the fact that Mr. See believes in doing as much repair work as possible when inspections are made, so that the inspection costs cover all overhauling of brakes and contactors, and other light repair work.

Running inspections are made on all cars at intervals that average 1150 miles, or approximately ten days' service. Every fifth inspection is called a general inspection, and at this time the car is not only given a thorough examination but has all repair work done that may be required to put the equipment in first-class condition. These general inspections are carried on in the inspection shed. Only when heavy work, such as wheel turning or truck repairs, is required are cars brought into the repair shop. Painting is done at such times as cars can be spared from service.

The inspectors are made responsible for finding all defective apparatus, the motormen on trains being required only to report defects that may develop upon the road or may cause train detentions. These detention reports as made by the motormen take the form shown in the accompanying cut. The form is made up in triplicate, and the backs of the upper two of each set of three blanks are covered with carbon copy material. This

provides the triplicate reports, avoiding the necessity for them to be written out three times. One copy of the detention report is sent to the dispatcher, another to the superintendent of car equipment and the third to the inspection shop foreman. It will be noticed from the reproduction that the indication for the car number has been made in very large letters, as it has been found difficult to get the motorman to enter the car numbers in every case—an absolute necessity if the trouble is to be successfully traced. It will also be noticed that, contrary to the usual custom, no form for explanation of the defect has been used. Instead, a blank space is left and the motorman fills this in by describing the defect or cause of detention in his own language.

Table III gives the cost of oiling, brakeshoes and car cleaning. Table IV gives the average life of brakeshoes, carbon brushes and lamps. The low life of compressor brushes is due to constant pumping that is required to maintain the air pressure with six air-operated doors and frequent use of the brakes. Fig. 2 gives the cost of material for lubrication, the labor being included in the cost of inspection. Fig. 3 gives the percentage of brakeshoe wear.

Table V gives the detentions chargeable to equipment trouble and percentage of trains late, regardless of cause of delay. This shows that the equipment has not been allowed to deteriorate, notwithstanding the low maintenance costs that have been attained and the severe operating conditions to which the cars have been subjected.

In conclusion, it should be said that the low costs of maintenance have been obtained by careful supervision, a liberal use of bonus and piece-work methods, and a systematic employment of the efforts of highly-paid, picked men. That the low costs were not obtained by underpaying the employees is shown by the average daily pay of $2.29 for all classes of labor, including car cleaners and laborers. In addition, of course, the low cost of maintenance and the reliability of service of the rolling stock on the road are to a considerable measure attributable to the special facilities provided for inspection and repair work. Not only were the construction and arrangement of the shop buildings carefully planned to promote rapid and thorough work but the motors and other apparatus on the cars which might require inspection or repair were installed with full regard to the consideration of accessibility by the inspectors. The repair shop is, of course, completely equipped with electric cranes and other devices suitable for handling all heavy material. The energy of the employees is reserved for productive effort, and consequently high-grade workmen are easy to retain. The arrangement and equipment of this inspection shed and repair shop were described in detail in the ELECTRIC RAILWAY JOURNAL of May 6, 1911.

TABLE III—MISCELLANEOUS COSTS AND MILEAGE, HUDSON & MANHATTAN RAILROAD

	Lubricant Cost in Cents per 1000 Car Miles	Brakeshoe Cost in Cents per 1000 Car Miles	Car Cleaning Cost per Car per Month	Annual Car Mileage
1910	15.77	84.15	$4.96	6,288,778
1911	13.66	50.67	$4.85	6,705,780
1912	14.33	42.70	$4.57	6,675,777
1913	13.66	45.99	$5.66	6,543,817
Average	14.36	55.88	$5.01	....

TABLE IV—MISCELLANEOUS DATA, HUDSON & MANHATTAN RAILROAD

	Mileage per Brakeshoe	Percentage of Wear of Brakeshoe	Mileage of Motor Brush	Mileage of Compressor Brush	Life of Lamp, Hours
1910	7,710	....	33,700	8,820	775
1911	10,780	68.0	26,400	8,910	965
1912	12,870	69.1	24,600	5,770	621
1913	11,800	68.8	26,800	5,660	686

One of the features of the cost records on the Hudson & Manhattan Railroad is found in the co-operation of the auditing department with the car department in the matter of charging material during the month in which it is used. This has been found to be a distinct aid in analyzing the relative costs of maintenance each month. Under this system brakeshoes, oil, etc., are charged for when they are drawn and not when they are received in carload lots from the manufacturers. The effect of the introduction of this system is shown by the comparative regularity of the curve in Fig. 3 after 1911, the new brakeshoes having been charged against the car department in carload lots prior to that time in much the same way. The cost of tire and wheel renewals is provided for in advance by charging against the shop, and crediting to a tire reserve fund, an amount equal to the estimated tire and wheel wear during each month, the amount having, of course, a certain relation to the car mileage made. This tire "reserve fund" is, therefore, a sinking fund against the purchase of new tires, when needed, and has, of course, been included in the maintenance costs above given.

All of the foregoing costs and records have been taken direct from the reports made to the Interstate Commerce Commission by the Hudson & Manhattan Railroad, of which W. C. Fisk is president. The subdivisions of the general accounts are those which are kept in the offices of the superintendent of car equipment, P. V. See, for making monthly cost comparisons on the various parts of equipment.

A. B. Slater, Burton, England, in his annual report on the working of Burton Corporation tramways, mentions that a return from thirty-one municipal undertakings of an average age of twelve years was last year published by the Newport tramways manager, and from this it appeared that the average cost of repairs and maintenance was $355 per car per annum, compared with $370 per car per annum in Burton-on-Trent.

"Safety First" Campaign at Boston

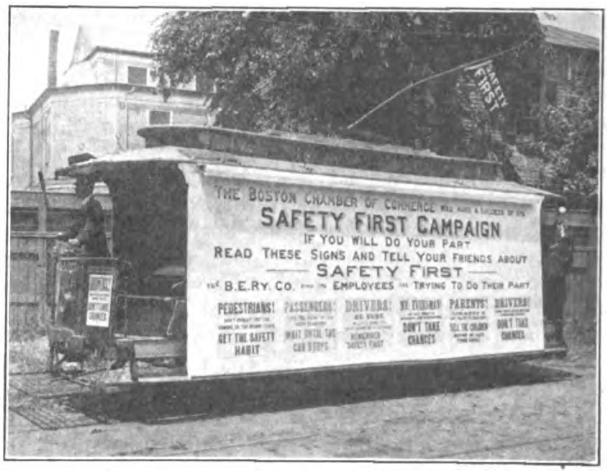
During the Present Month a Comprehensive Campaign Was Inaugurated Under the Auspices of All Interests Concerned and a Definite Impression Made—The Chamber of Commerce Co-operated with the Local Electric Railway Companies

One of the most carefully planned safety campaigns ever inaugurated in this country was begun on July 1 at Boston, Mass., under the co-operative efforts of the Boston Chamber of Commerce, the Boston Elevated Railway, the Bay State Street Railway, the Middlesex & Boston Street Railway and other organizations of semi-public and private character. The campaign is to extend through the entire month and is designed to appeal to the entire population of the Boston and eastern Massachusetts districts. An initial campaign for the safety of school children during the vacation season was waged by the Boston Chamber of Commerce in the middle of June, this being in a sense preliminary to the present extended effort on the part of all interested in safety on highways, to awaken popular appreciation of the problems of modern travel on thoroughfares occupied by the public. An outline of the June campaign and various details of the present one, with particular reference to street railways, is given in the following paragraphs.

"SAFETY FIRST" FOR SCHOOL CHILDREN

The school campaign was opened with a letter from Superintendent F. B. Dyer of the Boston public schools to principals and teachers, the letter being an indorsement of the work of the Boston Chamber of Commerce in sending printed suggestions for teachers and an open letter to parents giving advice to prevent accidents to children. The suggestions for teachers were in the form of an outline of a talk by teachers to their scholars at the close of school. This outline emphasized the increased danger of accidents to children during the vacation season, touching upon the greater use of the streets in summer, the large use of cars when patrons are in holiday mood, the absence of school discipline and the importance of taking care to avoid accidents between the close and the opening of school. The suggestions included a discussion of accident prevention points for both young and old children, with hints as to the creation of vivid mental pictures leading to safety precautions, blackboard mottoes emphasizing the need of personal care, appeals to the sense of prowess in encouraging older children to act as "street scouts" for the younger ones, calls upon the sense of responsibility for others, and appeals to the children's pride as young citizens in trying to make Boston the safest city for children.

The open letter from the Chamber to fathers and mothers pointed out that in the last twenty years, 25,000 children have been killed by trespassing on railroad tracks in this country and that in the last four years more than 30,700 accidents occurred on the lines of a single street railway company, many of these involving injuries to children and almost all arising from carelessness on the part of the persons injured. The letter contained several pithy suggestions regarding the use of streets and street cars, emphasizing the functions of public playgrounds and parks and including tersely worded advice in connection with crossing streets, avoidance of vehicles, waiting for cars to stop before getting on or off, looking both ways and keeping heads, legs and arms inside cars. At the bottom of each of these circular letters was a receipt to be torn off and signed by each child after the circular had been read by its parents, the receipt being returned to the teacher. About 200,000 of these bulletins have been sent by the Chamber to children in the schools of Boston, Brookline, Cambridge, Somerville, Newton and Chelsea, and approximately 7000 circular letters to teachers were sent.



BOSTON SAFETY CAMPAIGN—"SAFETY FIRST" ADVERTISING CAR

THE MAIN CAMPAIGN AT BOSTON

On the Boston Elevated, Bay State and Middlesex & Boston systems the campaign which was started on

SAFETY FIRST

IF YOU DRIVE A VEHICLE You owe it to yourself and everyone else to USE THE GREATEST CARE in crossing or driving on the car tracks.

IF YOU EMPLOY DRIVERS OF VEHICLES you owe it to them and to the community to instruct them carefully and to INSIST UPON THEIR CARE while driving in the streets.

IT PAYS TO BE CAREFUL

DRIVERS!

LOOK BOTH WAYS BEFORE CROSSING TRACKS.

DON'T TAKE CHANCES

Safety First Campaign Committee, Boston Chamber of Commerce.

PEDESTRIANS!

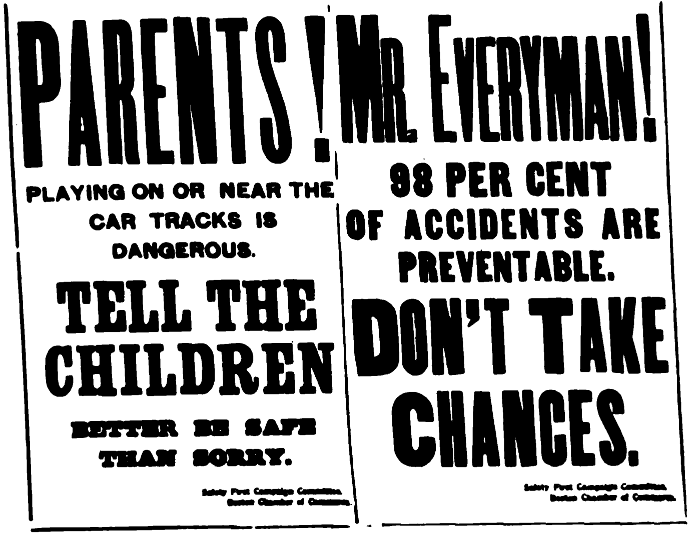
DON'T FORGET THE CAR COMING ON THE OTHER TRACK.

GET THE SAFETY HABIT

Safety First Campaign Committee, Boston Chamber of Commerce.

BOSTON SAFETY CAMPAIGN—SAMPLES OF DASHER POSTERS

July 1 was divided into six stages. In these some particular feature of accident prevention was emphasized for a few days as a keynote to the work as a whole; a few days later another feature was emphasized, and so on. The publicity matter of the campaign is being displayed in dasher signs, clerestory signs, subway and rapid transit line station signs, posters at carhouses, and stickers and bulletins carried on car windows, automobiles, teams, in stores and many other places. The Boston dailies co-operated liberally in the work, much space in the reading columns and a considerable number of editorials being devoted to accident prevention during the month. Every employee of the Boston Elevated Railway received a "safety first" leaflet issued by Second Vice-President M. C. Brush, outlining the accident prevention campaign launched by the Chamber of Commerce and asking for co-operation on the part of all those in the company's service. The Boston Elevated Company fitted up two eight-bench open cars with canvas signs occupying the entire side, the signs calling attention to the six salient features of the campaign periods, and being illuminated at night by ten 23-watt lamps, installed in a reflector trough which cut off all glare from the eyes of persons on the street. These cars were operated eighteen hours per day on the Boston system, and their routes were laid out to cover all quarters of the metropolitan district. The north and west sides of the city were covered from the Salem Street carhouse, in Medford, as a terminal, and the south and east sides from Grove Hall carhouse, in Roxbury. The cars each made a round trip in about seven hours, and attracted much attention on the streets. The local dailies showed views of them in service and gave descriptions of their work.



PARENTS!

PLAYING ON OR NEAR THE CAR TRACKS IS DANGEROUS.

TELL THE CHILDREN

BETTER BE SAFE THAN SORRY.

Safety First Campaign Committee, Boston Chamber of Commerce.

MR. EVERYMAN!

98 PER CENT OF ACCIDENTS ARE PREVENTABLE.

DON'T TAKE CHANCES.

Safety First Campaign Committee, Boston Chamber of Commerce.

BOSTON SAFETY CAMPAIGN—ADDITIONAL SAMPLES OF DASHER POSTERS

KEYNOTES OF THE CAMPAIGN

The Boston campaign was planned after a careful and extended study of safety work in many parts of the country, and the main features as presented to public attention on the various types of signs are given below, with the dates scheduled for their display.

(July 1 Display)

Dasher Signs.

DRIVERS

Look Both Ways Before Crossing Tracks.

DON'T TAKE CHANCES

Clerestory Signs.

SAFETY FIRST

If you drive a vehicle, you owe it to yourself and everyone else to use the greatest care in crossing or driving on the car tracks.

If you employ drivers of vehicles, you owe it to them and to the community to instruct them carefully and to insist upon their exercising care while driving in the streets.

IT PAYS TO BE CAREFUL

(July 7 Display.)

Dasher Signs.

PEDESTRIANS

Don't Forget the Car Crossing on the Other Track.

GET THE SAFETY HABIT

Clerestory Signs.

SAFETY FIRST

Before crossing the street look both ways. Get the Safety Habit. When passing behind a car remember that cars are running in the other direction.

Keep calm. Avoid hasty movements. Watch out.

BETTER BE SAFE THAN SORRY

(July 13 Display.)

Dasher Signs.

PASSENGERS

Face the front of car when alighting.

Wait until the car stops.

Clerestory Signs.

SAFETY FIRST

Statistics show that 75 per cent of the street car accidents are caused by passengers getting on or off while car is in motion.

Don't take chances. Watch your step.

Always face the front of the car in alighting. Help to prevent accident by waiting until the car stops.

SAFETY FIRST

(July 18 Display.)

Dasher Signs.

MR. EVERYMAN

Ninety-eight per cent of accidents are preventable.

DON'T TAKE CHANCES

Clerestory Signs.

SAFETY FIRST

Do you know that ninety-eight per cent of accidents are avoidable? You should do your share towards helping reduce accidents. By using caution in getting on or off cars and in crossing the streets you CAN and WILL prevent injury. Injuries are wasteful, costly and sometimes fatal.

IT PAYS TO BE CAREFUL

(July 23 Display.)

Dasher Signs.

PARENTS

Playing on or near the car tracks is

Dangerous

TELL THE CHILDREN

Clerestory Signs.

SAFETY FIRST

Fathers, Mothers, Relatives, School Teachers, Everyone: Teach the children not to play on or near the car tracks. They do not appreciate the dangers. The motorman will do his level best to prevent injuring them. Won't you do YOUR PART? You are the nearest and closest to them.

(July 28 Display.)

Dasher Signs.

DRIVERS

Be sure no car is behind you when turning on to the tracks.

Remember

SAFETY FIRST

Clerestory Signs.

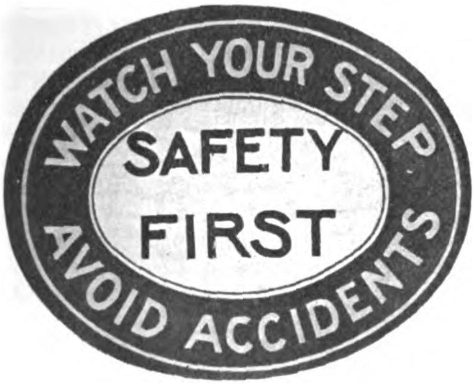
DRIVERS OF VEHICLES

If you are careful not to drive on the car tracks unless necessary, and then only with care, it will mean a great saving in life and limb to drivers and increased safety and promptness in service to the public. Don't take chances.

SAFETY FIRST

In each case the dasher signs and clerestory signs are signed by the "safety first" committee of the Chamber of Commerce. At the rapid transit line terminals the illuminated signs of the company reading "Safety First" are equipped with 5-watt, 55-volt tungsten lamps connected eleven in series and supplied with energy from the local third-rail feeders, the usual size of the sign being 3 ft. x 5 ft. The dasher signs are 14 in. x 21 in., printed on poster paper, and at least 30,000 of these were used. The company also ordered 50,000 oval stickers for use on car windows, doors and walls.

Just before the campaign opened the company's superintendent of inspection wrote a letter to the chief of police and to the chief engineer of the fire department in each of the municipalities served by the Boston Elevated Railway, outlining the proposed program and requesting the co-operation of their departments. In a circular letter to division superintendents at the outset of the campaign Mr. Brush pointed out that an important feature of the preventive work would be the reporting by street inspectors and by superintendents of all instances of flagrant chance-taking on the part of vehicles coming under their personal observation. In each of these instances the inspector made a note of the number of the automobile or the license number of the team, the name of its owner, etc., and the report was forwarded to the claim department. Officials of the company and members of the claim department were also expected to send in reports of this kind. The information thus gained was transmitted by the company to the Highway Safety League of Massachusetts, which then wrote a courteous letter to the vehicle owner cautioning him against a repetition of the act, in the interests of safer travel. During the campaign charts of accidents occurring daily were posted in all car stations on the surface system, and a record of accidents classified by their character and arranged according to rating stations was sent by division superintendents to the Superintendent of the Day at the company's main office for each day. The superintendents had been provided with posters issued by the Chamber of Commerce showing pictures of accidents along the lines as utilized in the San Francisco campaign, and these were freely offered to factory managers, garage owners, etc., in each division. Each superintendent was requested to obtain a list of employment offices in his territory, arranging to supply bulletins and circulars as needed, with special reference to offices where green girls apply for work. Only one accident to a passenger, and that one of the most insignificant character, occurred on the entire Boston Elevated system on the opening day of the campaign.



BOSTON SAFETY CAMPAIGN—STICKER FOR USE ON CAR WINDOWS, DOORS AND WALLS

Arguments on Municipal Ownership at Washington

The Bureau of Public Service Economics, 17 East Thirty-eighth Street, New York, has issued in pamphlet form an abstract of the arguments presented by representatives of the American Electric Railway Association and others at the recent hearing in Washington on the Crosser bill. These hearings were reported in recent issues of this paper. The pamphlet is 6 in. x 9¼ in., contains seventy-two pages and is an excellent summary of the situation compiled from the official stenographic report. It contains abstracts of the arguments presented at the Washington hearing in favor of municipal ownership as well as those against the plan, and the various paragraphs are marked by the page number in which the testimony appears in the official report, so that it is possible for the reader easily to refer from one to the other. In addition, the pamphlet contains a three-page index so that any subject discussed by those who gave testimony can easily be found. The Bureau of Public Service Economics has placed a nominal price of 50 cents per copy on this book.

The Pacific-Electric Opens a New Line

The formal opening of the new San Bernardino line of the Pacific Electric Railway System of southern California on July 11 was a matter of no little importance in electric railway circles. This new line, which extends for 59 miles from Los Angeles to San Bernardino, is the longest in the system, and it represents a construction expenditure of $1,250,000. It penetrates a particularly fertile and wealthy district, which will mean a large additional revenue to the company, and it increases the trackage of the system to a total of about 1067 miles.

There is much of the country which the line traverses that is as yet undeveloped, and there are long stretches where there are no towns of any great importance, so that the cars running over this line will be operated at a very high speed. Later, when the country shall have reached a greater development, additional tracks will be laid so as to accommodate both fast and slow trains. For the present the line voltage will be 1200.

Twenty passenger cars are now being operated, and later the number will be increased to forty-five. The present cars are intended only for temporary use, having been rebuilt for the purpose, but new cars, to cost a total of $675,000 for the forty-five, or $15,000 each, have just been ordered. These cars are to be of all-steel, non-telescopable construction, and they will seat sixty persons each. At present the service consists of ten two-car trains in each direction daily. The new line also affords electric freight facilities to the territory it serves, which is an orange-growing district.

All bridges are of concrete-arch construction, with provisions for additions when the growth of traffic will necessitate putting a second track in operation. The line utilizes country and city highways as much as possible for its right-of-way.

The opening of the new line was marked by a big celebration at San Bernardino, which was attended by about 20,000 persons. The final spike, of solid silver, was driven by Mayor H. H. Rose of Los Angeles and Acting Mayor Claude R. Davidson of San Bernardino, silver-plated hammers being used for the purpose. These, as well as the orangewood tie into which the spike was driven, were presented by local chambers of commerce. The pageant, which was an important feature of the occasion, was a portrayal of the history of transportation in this locality extending from early Indian days down to the present time.

In addition to this newly completed line the Pacific Electric Railway Company has begun the work of improving and extending a number of shorter lines around San Bernardino. Authorizations have been obtained from the State Railroad Commission for the expenditure of $105,000 on the San Bernardino-Highland line, $43,000 on the Redlands-San Bernardino line, and $408,000 on the Riverside-Colton-San Bernardino line.

Pacific Claim Agents' Association

Additional Papers Read at the Spokane Convention Are Published in Abstract—These Include Consideration of the Trespassing Evil and of Progress of the Safety Movement on the Pacific Coast

Several papers presented at the convention of the Pacific Claim Agents' Association held in Spokane, Wash., July 9-11 were received too late for publication in the last issue of the ELECTRIC RAILWAY JOURNAL, and these are published in abstract in the following paragraphs. They include the consideration of a remedy for injuries to trespassers and also an outline of the work done by the various electric railways on the Pacific Coast along the lines of "safety first" and accident prevention.

REMEDY FOR THE TRESPASSING EVIL

BY H. K. RELF, GENERAL CLAIM AGENT SPOKANE, PORTLAND & SEATTLE RAILWAY, PORTLAND, ORE.

The legal duty of railways toward trespassers is to refrain from wantonly hurting or killing them, but from the standpoint of humanity there is a greater duty—that is, to prevent them if possible from placing themselves in a dangerous position or to remove them from the property when found thereon. Transportation companies cannot accomplish this without the aid of the law-making and law-enforcing powers. No amount of care, no amount of supervision on the part of the railways, can stop the trespassing or prevent the trespasser from being hurt. Some of the States have passed laws making it a misdemeanor for outside persons to walk on the right-of-way of a railway company or to ride on a train with the intention of evading the payment of fare, but such laws are of no avail unless they are enforced. Many cities and smaller towns have similar laws. Occasionally these laws are meekly enforced, but more often they are not. They do not cope with the situation, and the railroads are left to deal with the trespasser as best they can. Where such laws exist the railroads should give wide publicity to the statute. They should have it posted in all their depots and in all conspicuous places, advising the public that it is in violation of the law to trespass upon the property of a railway company, and that the railroad does not consent to the use of its tracks as a highway.

Statistics for the past twenty years show that about 5000 persons are killed each year in the United States while walking on railway tracks or beating their way on trains, and a greater number are seriously injured. Analysis of the reports shows that only about 20 per per cent are tramps and hoboes, while 14 per cent are children under eighteen years of age, and 66 per cent are citizens of the locality in which the accident occurred, most of them wage earners.

This unnecessary loss of life could have been to a great extent prevented by the passage and enforcement of effective laws. The railway companies are forced to realize that some effective steps must be taken to put a stop to this drain on our population, and it is for us to do what we can to assist in the work. At many places warning signs are erected on the right-of-way at various points, but few pay attention to them. Special officers are employed to patrol yards and tracks in districts where persons walk along or across tracks, but it seems impossible to break up the practice. When arrests are made and offenders taken before the magistrate, instead of being fined or imprisoned they are let off with the warning not to do it again. If the offender is a resident of the locality the judge refrains from putting a hardship on him or his family, and if not a resident he does not give him a jail sentence on account of the expense to the community in feeding him while serving his time. In some of the Eastern States, where I understand that laws are in effect and enforced, many arrests have been effected and efforts have been made to prevent trespassing on the property of railway companies, and it is high time for our Western States to take the necessary steps to stop the practice. We should have the necessary legislation and rigid enforcement of it.

In Great Britain to walk on railway tracks is a misdemeanor punishable by fine or imprisonment, and the law is enforced. As a result few accidents to trespassers occur. If the legislatures of the various States will not enact laws against the trespass evil that will be enforced, our federal government should pass a law to prevent persons from trespassing upon the property of railroads engaged in interstate commerce. A short time ago the federal government saw fit to pass a law making it a crime to steal from freight cars, and that law has been enforced. Most people fear the federal government more than the State governments, and I believe that a federal law would have more effect if it can be passed.

Our trainmen are instructed that no one shall be permitted to ride upon a train unless transportation is paid for, but they have not received the necessary authority by this State (Washington) to enable them to carry out our instructions. On nearly every train, especially freight trains, will be found men who are beating or attempting to beat their way, and if the brakeman orders them off he does so at the risk of being assaulted. Any number of claims have been made against transportation companies on account of injuries to trespassers, and vast sums of money have been spent in resisting and settling claims of that character. In addition to the expenditures in court cases and judgments directly chargeable to the trespass evil, the railways are confronted by enormous losses through constant pilfering and destruction of property by the trespasser who works inside the cars. A person trespassing is a lawbreaker and should be so regarded, and when injury results he should be left without a remedy.

At the meeting of the Association of Railway Claim Agents held at Baltimore in May, 1913, this question was considered at some length, exhaustive papers on the subject were read and general discussion indulged in by the representatives of various railroads. It seemed to be the general opinion that the only way to handle the matter effectually was to bring it to the attention of our representatives in Congress and have a federal law enacted that could prohibit and possibly prevent trespassing on railroad tracks and trains. A committee of fifteen members was appointed for the purpose of dealing with the trespass problem. In order to assist in this work the committee is gathering statistics for the purpose of showing the necessity for such legislation and to furnish a basis for publicity and agitation of the question. Publicity is one important feature of the work, to the end that public opinion may be moulded, not only for the purpose of aiding in the procurement of proper legislation, but also in its enforcement. While proper legislation and its enforcement are very essential, in addition, in order to reduce trespassing to a minimum, we must have the hearty co-operation and approval of the public and assistance of parents, teachers, office-holders and others.

REPORT OF COMMITTEE ON SAFETY

BY GEORGE C. CARSON, CLAIM AGENT PUGET SOUND TRACTION, LIGHT & POWER COMPANY

The executive committee at its meeting held in Seattle on Feb. 6 instructed the secretary of the Pacific Claim Agents' Association to establish and maintain in his office a library of safety literature and in that connection authorized its chairman to appoint a standing committee on safety "to assist the secretary in this work." Under this order Chairman Handlon appointed Messrs. Carson, Aston, Lee, Boynton, Beck and Winsor as such committee, and, in addition to the duty of assisting the secretary in the work of collecting a safety library, this committee was instructed to make a special report on safety from the standpoint of the public and the companies, and on safety work of the various companies.

The individual reports of the various members of the committee, combined in this report, state among other things, that it must be made difficult for employees to cause accidents or for the public to meet with them. But car men will forget and the public will not wait. It is the business of railway superintendents to repair in part that element of frailty. The first duty that a public service company owes is to its passengers. Therefore, it is very necessary that the safety movement be extended to take care of the public who from day to day travel upon our systems. There is no larger leak than the accident leak, and if it is not properly attended to will soon grow to such volume as very nearly to make it impossible to operate.

Under the safety organization of the Tacoma Railway & Power Company, which, owing to the number of lines operated and other peculiar conditions, differs somewhat, in both form and methods from those of other cities. There is a "safety committee" headed by the superintendent of efficiency as chairman and consisting otherwise of trainmen from the various lines, an inspector of city lines and a number of representatives from shops, track and power departments—eighteen to twenty members in all. This committee meets at noon once a month, has a good lunch and then discusses the safety movement freely. When a man's term as a member of this committee expires, he goes forth a more loyal man and with a much broader view and a more sympathetic understanding of the difficulties of the business from the management's side. The report of this safety committee's first year's work showed that 90 per cent of its 244 recommendations had been adopted by the management, and its work continues to this time to receive like consideration. This company employs a card system of reporting defects consisting of boxes containing "safety first" cards located at convenient places throughout the system. Receipt of each report is acknowledged and its substance in turn is transmitted to the proper department for consideration and action. Later, the party making the original report is notified as to what action has been taken. On form cards provided for that purpose the claim department receives from employees reports of reckless operation of vehicles on the streets, and immediately communicates with the proprietor of such vehicle, calling his attention to the matter and seeking his co-operation for public safety.

The Washington Water Power Company organized its safety committee in 1912. The company encourages members of the committee to make suggestions for accident prevention, this resulting in more than 500 suggestions coming in from all departments, the majority of which the company has adopted. Suggestions are taken up and discussed at general committee meetings once a month. Index files are kept of all suggestions arranged alphabetically under names of members making them. Monthly meetings of car men are held for discussion of safety matters. Safety buttons are issued to members of the safety committee, and men are given special recognition for safety service. The company has provided lectures on safety for children in the schools of Spokane and will continue this line of educational work.

In Seattle the results of the safety movement, as promoted through the safety committee organization of the Puget Sound Traction, Light & Power Company, have been extremely gratifying, both from the standpoint of increased protection to the public and the company's employees against injury by accident and in the reduction of the percentage of gross earnings consumed by claim adjustments. As to the latter phase, it may be stated that whereas the percentage of gross railway earnings going to claim adjustments in the first five months of 1910, just prior to the beginning of active safety organization and work, was nearly 10 per cent, the year 1913 showed only 5.15 per cent used for this purpose. Among the things incident to this company's safety campaign that have contributed largely in bringing about this spirit of co-operation on the part of the men the following may be particularized: 1—Carhouse meetings at which claim department, supervisory and other officials discuss with the men in a spirit of mutual helpfulness, safety and other questions in which they have a common interest; 2—The "carhouse bogie" system, which, briefly explained, is a competitive system among the trainmen of the several carhouses, showing numerically on large specially ruled forms the accidents in which each and all of the carhouses are involved during any month; 3—The publication monthly in the company's magazine, the *Puget Sound Electric Journal*, of carhouse news and personals, with special reference to these accident records, employees' safety reports and local safety matters in general; 4—Carhouse lectures on safety subjects illustrated with stereopticon views; 5—The semi-annual banquets given to each newly-appointed safety committee at the beginning of its term.

With reference to the matter of interesting the public and securing its co-operation in the safety movement the claim department of the Puget Sound Traction, Light & Power Company regards the work being done by it in and through the city schools of Seattle, both public and private, as the most effective means of accomplishing this end. The company employs a safety instructor who goes into the schools and devotes all his time to this work. A circular letter to vehicle owners of the city; the posting of safety bulletins and posters in garages, livery barns and other public places, and a general policy of securing publicity for matters relating to the subject of safety sums up in a general way this company's efforts to reach the general public directly. As to the matter of receiving reports from employees as to reckless operation of vehicles on the streets and the treatment of same, the Puget Sound Traction, Light & Power Company employs practically the same system and methods as those outlined for the Tacoma companies, and regards the results as generally satisfactory.

About seven years ago, on the lines of the Portland Railway, Light & Power Company, an average of thirty-five accidents occurred each day, but, at present, with twice as much traffic less than one-third the number of accidents occur. This was effected by "safety" work.

The first work was to bring in all trainmen for a talk on care and caution, and prevention of accidents, and what to do in case an accident occurred. After all the men had been instructed, they were notified that they must return once every six months and attend one of the schools of instruction, so that they would constantly have the matter before them and always be on the alert. It was also made necessary for all new trainmen, after having been broken in on the different car lines, to attend one of these meetings and be thoroughly instructed along the lines of accident prevention and the care of accidents after they occur. These meetings were started about seven years ago and have been held weekly ever since. These schools were later extended to cover all employees of the company in every department.

After getting this well started, a lecturer on "safety" was sent to the public and private schools to talk to the children to educate them to be more careful, and through them to reach the "grown-ups" in their homes. There have been but two accidents to children of school age in the last five years. For the first two years the lecturer covered the schools twice each year, or once each school term, but he is now making but one annual visit.

On Nov. 1, 1913, there were organized "safety committees" comprised of a central safety committee and sub-committees from every department, numbering about 125 members. Through these safety committees the company is finding all of its danger zones, and most of them were conditions which required but very little work to remedy. Since the organization of these safety committees there have been received about 450 safety suggestions, and more than 300 of them have been acted upon. In comparison with the accidents for the first five months of 1913 the same period in 1914 shows a decrease of 422 accidents.

The company is gradually working toward the point where all of the cars will have folding steps, closed doors and disappearing handles, and this will absolutely eliminate all types of accidents arising from boarding or alighting from moving trains. "Safety" slogans are painted on the sides of the cars, and from time to time different "safety" slogans are carried on the dash signs. The company has had men carry large banners through the streets, moving from one busy corner to another and standing there, the banners being brightly painted with "safety" warnings.

The company is preparing to adopt the plan of moving pictures for the purpose of educating the public along these lines, and it is felt that this will be a great factor in helping get the public interested. The company has also just induced Mayor Albee of Portland to appoint a public safety commission for the purpose of investigating and rectifying any and all dangerous conditions of every name and nature.

Interurbans Excluded from Rayburn Bill

Under an amendment recommended by the Senate Interstate Commerce Committee, electric railways will not be subject to the provisions of the Rayburn "securities issue" bill unless they are a part of the system of an interstate steam railroad. An effort was made to have the House committee exclude the electric lines but failed.

When the question was taken up by the Committee on Interstate Commerce of the Senate a hearing was given on June 16 to representatives of the American Electric Railway Association. Horace F. Clark, attorney for the association at Washington, presented the speakers, who were Arthur W. Brady, Indiana Union Traction Company; Bernard F. Weadock, Detroit United Lines; James M. Barrett, Fort Wayne & Northern Indiana Traction Company, and Charles L. Henry, Indianapolis & Cincinnati Traction Company.

Mr. Brady presented statistics of the interurban electric lines in the country and showed that while some of them did a small interstate business they were primarily local carriers and that the State statutes under which they operated were adequate to regulate the issue of their securities. He also showed that many of the companies owning interurban lines also owned city lines, electric lighting and other public utility systems and that the result of putting the interurban lines under the jurisdiction of the Interstate Commerce Commission, so far as the Rayburn bill was concerned, would also place under the jurisdiction of the commission these other utilities which were purely local in nature. He said that he did not believe that this was ever the intention of Congress. He also cited the case of the Omaha & Council Bluffs Street Railway and the Omaha & Council Bluffs Railway & Bridge Company vs. Interstate Commerce Commission (230 U. S. Rep. 324) in which the Supreme Court had decided that street railways are not covered by the provisions of the interstate commerce act even when they carry passengers across a State line. He also dwelt on the extensive work on which the Interstate Commerce Commission is now engaged in regulating steam railroads and upon the valuation of steam railroads which had been begun, and he spoke of the expense and inconvenience which would be placed upon the interurban companies in case they should be obliged to go to Washington and present before the Interstate Commerce Commission their requests for permission to make the small issues of securities which they required in their business.

Mr. Weadock said that the Detroit United lines operate in 166 different municipalities in Michigan, that under the State constitution the municipalities have almost unlimited home rule and that the Michigan Railroad Commission has also very broad powers, including those to regulate the issue of securities by railway companies. The Michigan commission, he said, was fully acquainted with the property of his company and was continually inspecting the line. Mr. Weadock stated that the commission also knows all of the details of the property and was in a better position to protect the company and the people of the State than could the Interstate Commerce Commission. The interstate business of the company which he represents was less than 1 per cent. It would be a great hardship if the company was obliged to go to Washington to have a hearing before the Interstate Commerce Commission, which it would be obliged to do under the proposed act.

Mr. Barrett and Mr. Henry explained the situation on their roads in Indiana, which was similar to those mentioned by the other speakers, and they cited instances to show that the interstate commerce portion of their business was very small compared with the local business. It was after this testimony that the decision already mentioned was reached.

The completion of the Rayburn bill by the Senate committee was the finishing committee touch upon the administration's "trust legislation" program in the Senate. It is to be considered practically simultaneously with the Newlands interstate trade commission bill, which has been debated for about three weeks, and the Clayton "trust definition" bill reported this week. There will be at least six weeks of debate in the Senate with every prospect that even after the measure has been passed, there will be a long period of "conference" before the Senate and House can agree to compromise their conflicting amendments.

American Association News

Meeting of Joint Committee on Engineering Accounting Results in Completion of Important Report—Accountants' Correspondence Course Passes Halfway Point—Manufacturers' Association Entertainment Committee Appointed—Committee on Education Active.

COMMITTEE ON EDUCATION

On July 22 a sub-committee of the committee on education of the American Association, appointed to prepare plans for courses of correspondence study for young men in the various engineering branches of the industry, held a meeting at the association headquarters. Representatives of one of the prominent correspondence schools were present and presented curriculums which they had prepared in accordance with the committee specifications. These are now being carefully studied by the sub-committee and a definite proposition will be laid before the full educational committee at a meeting to be held within the next few weeks. It is expected that a practicable working scheme is now in sight and will be ready for presentation to the association at the Atlantic City convention.

JOINT COMMITTEE ON ENGINEERING ACCOUNTING

The joint committee on engineering accounting held a two-day session July 22 and 23. In addition to J. P. Barnes, general manager Syracuse & Suburban Railroad Company, who is chairman of the joint committee, there were present F. A. Bagg, chief engineer Fonda, Johnstown & Gloversville Railroad Company; C. H. Lahr, auditor Northern Ohio Traction & Light Company; J. P. Ripley, J. G. White & Company; Martin Schreiber, engineer maintenance of way Public Service Railway, and J. C. Collins, general auditor, New York State Railways, Rochester Lines.

The report of a sub-committee on cost accounting was received, and, after revision by the committee, was adopted. The full report will outline the fundamental principles involved in interdepartmental charges, cost accounting and overhead charges, as well as general systems of application in each of the above divisions. This report is now ready in tentative form and will be sent out by the secretary to all members of the committee for criticism before it is printed and presented to the association prior to the convention.

ACCOUNTANTS' CORRESPONDENCE COURSE

Two hundred of the required 400 enrollments have been secured for the correspondence course described in detail in recent issues of the ELECTRIC RAILWAY JOURNAL. The educational committee of the association desires to emphasize the importance of prompt enrollment of all interested, as it would be unfortunate if the plan should be allowed to lapse through lack of support. Blank application forms can be secured by addressing the secretary of the A. E. R. A., 29 West Thirty-ninth Street, New York City.

ATLANTIC CITY CONVENTION

H. G. McConnaughy, secretary of the American Electric Railway Manufacturers Association, has issued to all manufacturers who have been assigned space at the Atlantic City Convention next fall, rental order blanks covering all kinds and styles of wicker, oak and mission furniture from which to choose their requirements. The blanks contain prices charged for each kind of furniture to be ordered. These charges include placing the furnishings in spaces ready for use and the removal of the same at the close of the convention. Manufacturers are requested to fill out blanks in duplicate by typewriter and return both copies to the office of the A. E. R. M. A., 165 Broadway, New York, N. Y., by return mail. Exhibitors are urged in particular to have their men report to the exhibit hall early so as to have their exhibit set up and completed by Saturday, Oct. 10. This gives all a chance to devote their time to the many delegates who always arrive at Atlantic City for Saturday and Sunday, with an assurance that everyone and everything will be ready Saturday night. Most important of all, it will do away with the extra charge for night, Saturday afternoon and Sunday work, which means double time for electrical connections, etc. The exhibit committee will be ready to assist anyone at a moment's notice as well as all of its contractors, who will co-operate with everyone in finishing all details by Saturday. Blanks will be issued from time to time covering every detail in regard to the convention. Orders should be placed on these blanks only.

In connection with the wireless inquiry received by Mr. McConnaughy last week from a foreign manufacturer, this inquiry has been followed up by the receipt of a cable message from this company, applying for exhibit space.

The Entertainment Committee, as it now stands, is composed of the following members: Chairman, W. G. Kaylor, Westinghouse Traction Brake Company, 165 Broadway, New York, N. Y.; H. G. Barbee, Maryland Steel Company, Boston, Mass.; E. F. Chaffee, O. M. Edwards Company, Inc., Syracuse, N. Y.; Thomas Cooper, Westinghouse Electric & Manufacturing Company, Philadelphia, Pa.; N. M. Garland, Ohio Brass Company, 30 Church Street, New York, N. Y.; Alfred Green, Galena-Signal Oil Company, 17 Battery Place, New York, N. Y.; A. A. Hale, Griffin Wheel Company, Boston, Mass.; W. A. Lake, Pantasote Company, 11 Broadway, New York, N. Y.; E. R. Mason, E. R. Mason & Company, Inc., 70 East Forty-fifth Street, New York, N. Y.; H. N. Ransom, Westinghouse Electric & Manufacturing Company, 165 Broadway, New York, N. Y.; W. H. Wilkinson, Pressed Steel Car Company, 24 Broad Street, New York, N. Y.; L. E. Gould, ELECTRIC RAILWAY JOURNAL, Chicago, Ill.; W. L. Boyer, Bemis Car Truck Company, Springfield, Mass.; Ross R. Hayes, Curtain Supply Company, 50 Church Street, New York, N. Y.; A. L. Whipple, P. O. Box No. 812, New York, N. Y.; H. G. Pearce, 1103 Morris Building, Philadelphia, Pa.; S. W. Trawick, General Electric Company, 30 Church Street, New York, N. Y.; R. M. Campbell, Detroit Graphite Company, 135 Broadway, New York, N. Y.; C. G. Chamberlin, F. W. Devoe & C. T. Raynolds Company, 101 Fulton Street, New York, N. Y.; William V. Dee, G. Drouve Company, Bridgeport, Conn.; H. H. Helms, Aluminum Company of America, Pennsylvania Building, Philadelphia, Pa.; H. A. Hegeman, U. S. Metal & Manufacturing Company, 165 Broadway, New York, N. Y.; William J. Fleming, Jr., Automatic Ventilator Company, 2 Rector Street, New York, N. Y. The foregoing list will be enlarged from time to time and on its completion in September will probably include about thirty-five members altogether.

New members are being steadily enlisted to the

Association. Companies enrolled for the week ending July 23, 1914, are: S. K. F. Ball Bearing Company, 30 Church Street, New York, N. Y.; Index Visible, Inc., Times Building, New York, N. Y., and the Alloy Steel Forging Company, Pittsburgh, Pa.

COMMUNICATION

Interurban Centers in Rank of Importance

THE GREATER DAYTON ASSOCIATION
DAYTON, OHIO, July 20, 1914.

To the Editors:

We understand that Indianapolis holds, without question, the title of the largest interurban center in America. We would like to know how Dayton ranks in this regard. There are four interurban companies, operating eight lines, in and out of Dayton as follows: Ohio Electric Railway System—Cincinnati, Columbus, Richmond and Union City Divisions; Dayton, Springfield & Xenia Southern System—Xenia and Spring Valley Divisions; Dayton, Covington & Piqua System—Piqua Division; Dayton & Troy System—Troy Division. We have been informed that these eight divisions or lines entitle Dayton to rank second in interurban facilities. Would you be kind enough to inform us whether this is true, and if not, what cities precede us?

S. H. ANKENY.

[We think that the degree of importance should depend upon the number of cars in and out each day. Here is an opportunity for some comparative figures.—EDS.]

Development of Commission Regulation

In the *Public Service Journal* for July, 1914, issued by Stone & Webster, L. R. Nash, of the Stone & Webster Management Association, contributes a very interesting article on "The Development of Commission Regulation." The article is accompanied by a map, reproduced below, which shows five groupings of States, namely, (1) those in which the commissions have full jurisdiction over all utilities, (2) those in which the commissions have full jurisdiction over all utilities except in regard to capitalization, (3) those in which the commissions have limited jurisdiction over railroads and some city utilities, (4) those in which the commissions have supervision of carriers and of some telegraph and telephone companies, (5) those in which there are no commissions. In the latter group are only three States—Delaware, Utah and Wyoming. Delaware has a commission in Wilmington, which is the only city of importance in the State.

The article is also accompanied by a table showing the States in a somewhat different grouping, giving the names of the regulatory commissions.

Denatured Electricity

An interesting method of preventing the improper use of electric current has been devised by an Italian engineer. The practice of making especially low rates for current to be used in electric power, heating and cooking devices is becoming more and more general, but with the ordinary constant potential current it is difficult to detect the use of lighting devices on circuits intended only for power and heating purposes. This engineer advocates the use of special circuits on which the current is subject to extreme fluctuation of voltage at rapidly recurring intervals, which would make it practically impossible to use lamps, because of the flicker in the lights. As the current is not entirely interrupted and the normal voltage is almost immediately restored the proper operation of power or heating apparatus is not interfered with and the rightful use of the circuits for their respective purposes is assured.

Cost of Bonding

BY CARL H. FULLER, ENGINEER MAINTENANCE OF WAY
MACON RAILWAY & LIGHT COMPANY

The individual cost of various types of bonds may be readily obtained from the salesman who calls periodically. In fact he is inclined to lay particular stress on the cost of his particular bond, but when it comes to the installation of the bond the track man faces a problem peculiarly his own. Where any quantity of bonds is to be installed the field cost becomes an important consideration, although this is not always considered by the purchasing agent. Frequently the cost of applying the bond and its future maintenance is of more concern than the difference in the first cost of the various types of bonds. The writer, therefore, believes that the following data derived from the bonding records of the Macon Railway & Light Company, Macon, Ga., will be found instructive.

The writer looks with disfavor on all very short or rigid forms of bonds, as in most cases the track, where not laid in the concrete base of paving, is subject to considerable vibration at the joint which results in the mechanical destruction of the bond. On this road we have adopted three types of bonds as best meeting our requirements, namely: the concealed, stranded, compressed terminal type used under the splice plates, 7 in. to 9 in. in length, depending on the bolt spacing; the stranded long bond 24 in. to 36 in. in length with compressed terminals, to be used around the plates; and a pin-compressed terminal bond of about the same description, to be used where the rail is too small to admit of good work with the compress or for single replacements to be made by the track men when it is not convenient to send for the bonding crew.

In the two years we have been using these types of bond there has not come to the writer's knowledge a single case of failure due to mechanical conditions, although a few bonds have been melted or burned out. This is more than can be said of many special bonds. The following costs apply exclusively to these types:

Case 1. Paving job. Track laid and surfaced, with two bolts in each splice. Bond crew removed the plates, drilled two holes, applied the concealed bond with a screw press and full-bolted the joint: 174 bonds at $0.2625 per bond.

Case 2. Installation of a crossover in Belgian block paving. Bond crew drilled the holes, applied concealed or long bonds as required, full-bolted the joints: thirty-five bonds at $0.266 per bond.

Case 3. Repaving job. Old plates and bonds were not disturbed. Twenty-eight inch bonds with compressed terminals were placed around the old plates. Bonding crew had a good chance to do record work and placed 128 bonds at $0.175 per bond.

Case 4. Paving job. Bond crew removed two bolts and plates, drilled for and placed concealed bond, replaced the plates with two bolts loose for track gang to finish: 199 bonds at $0.1825 per bond.

Case 5. Paving job. Bonding crew applied concealed bonds while track gang was laying track, but made no special effort to full-bolt the joints: eighty-five bonds at $0.168 per bond.

Case 6. Paving job. Track all surfaced, double track, bond crew following all four rails as they came to the joints, rails 60 ft. long, special effort to get low bonding costs, track gang applying the splice plates: 269 bonds at $0.09 per joint. This was an exceptional case and the same crew has never been able to break its own record.

Case 7. Laying track in dirt roads. Bond crew applied pin-compressed terminal bonds under the plates, doing the bolting up: 113 bonds at $0.136 per bond.

Case 8. Paving job. Remove plates with two bolts, drill two holes, compress bond and replace plates with

DRILLING JOINT PLATES AND APPLYING CONCEALED BOND four bolts, continuous work: 187 bonds at $0.235 per bond.

Case 9. Paving job. Remove plates, drill holes with hand drill, compress bond, replace the plates: eighty-three bonds at $0.375 per bond.

Case 10. Track laid in dirt road and fully surfaced. Remove plates with four bolts, drill holes and compress bond, replacing the plates. The four men in the crew worked continuously: 1020 bonds at $0.2405 per bond.

Case 11. Remove plates having four bolts, drill and press in bond, replacing plates: fifty-four bonds at $0.292 per bond.

SUMMARY

Case 1	174	bonds at	$0.2625	per bond
Case 2	35	bonds at	0.266	per bond
Case 3	128	bonds at	0.175	per bond
Case 4	199	bonds at	0.1825	per bond
Case 5	85	bonds at	0.168	per bond
Case 6	269	bonds at	0.09	per bond
Case 7	113	bonds at	0.136	per bond
Case 8	187	bonds at	0.235	per bond
Case 9	83	bonds at	0.375	per bond
Case 10	1020	bonds at	0.2405	per bond
Case 11	54	bonds at	0.292	per bond
Total	2347	bonds at	*0.215	

*Average cost per bond.

With the exception of the single case noted, all of the drilling was done with a Duntley electric track drill, the crew consisting usually of one man who ran the drill and a helper who helped him move the drill and pressed in the bonds. Both men removed and bolted up the plates as the occasion required. There is some slight gain in making the crew three men if the work warrants.

The accompanying illustration shows our drill runner operating the electric drill, the inside splice plate being removed, the outer one remaining in place during the operation to balance the joint; while his assistant is compressing the terminals of a concealed bond with a screw press, the bond itself being plainly visible as it lies along the web of the rail.

A few minutes prior to photographing, these two men removed one pair of plates, bolted with two bolts, drilled two holes, applied and compressed the terminals of the bond, restored the plates with two bolts tight for paving, making the complete joint in three seconds less than fourteen minutes. If we figure the time of these two men at $0.285 per hour, we get a cost of slightly less than 7 cents per joint. However, this was a stop-watch exhibition record that cannot be maintained on straightaway work with its incidental distractions and attendant interruptions. The nearest approach to it in regular work is Case 6, where the bond was applied around the plates.

The following is a six months' record of bond replacements, the work being scattered into installations of a few bonds here and there. In all cases the cost includes the breaking out of old bolts, removing old plates and old bonds, reaming or drilling new holes and rebolting plates and the time lost moving about. The work usually was done in the intervals between construction jobs and other labor.

First month	85	bonds at	$0.285
Second month	42	bonds at	0.31
Third month	54	bonds at	0.295
Fourth month	37	bonds at	0.35
Fifth month	94	bonds at	0.325
Sixth month	21	bonds at	0.36
Total	333	bonds at	*0.313

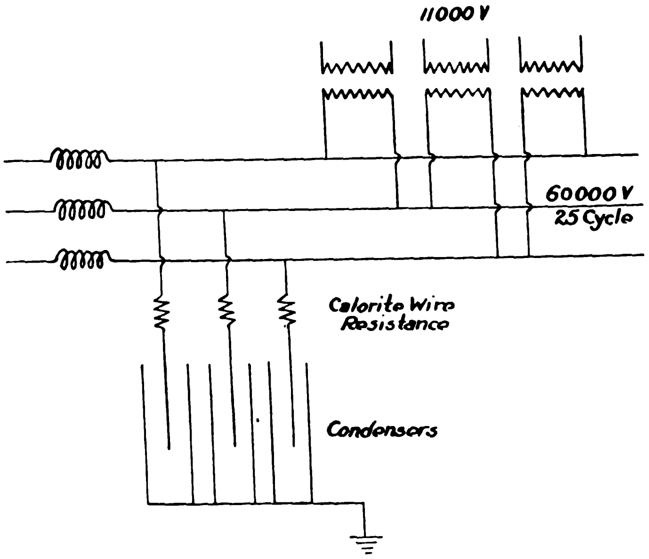
*Average cost per bond.

The foregoing costs represent fairly well the average condition met with in bond maintenance in dirt roads or on private right-of-way. The wage of the drill runner was $1.50 and of the helper $1.35 per day of ten hours.

Surge Protector in Syracuse Substation

BY G. N. BROWN, ELECTRICAL ENGINEER SYRACUSE-UTICA LINES, NEW YORK STATE RAILWAYS

The New York State Railways obtains its power for operating the cars in Syracuse and other cities in central New York from the transmission lines of the Niagara, Lockport & Ontario Power Company. Prior to April 9, 1914, the main supply of power came from Niagara Falls, but since that date the Salmon River hydroelectric plant, described in the issue of the ELECTRIC RAILWAY JOURNAL for June 20, page 1378, has been operated in parallel with the Niagara Falls plant. Since the Salmon River plant was put into operation the Syracuse load had been carried by the Salmon River plant whenever there was an indication of an approaching storm which might cause a disturbance on the transmission line from Niagara Falls. The Niagara Falls line is disconnected from the Salmon River-Syracuse line under these conditions. By this method of operation, line surges, which are necessarily present at times in such a great system of distribution as that of the Niagara, Lockport & Ontario Power Company, have been greatly reduced. The system comprises more than 600 miles of line, including not only the two main trunks from Niagara Falls to Syracuse but also the secondary distribution.



SURGE PROTECTION AT A SYRACUSE SUBSTATION

The segregation of the Syracuse load greatly reduces the danger from surges, but in the summer of 1913 the railway company decided to install a surge protector at the Tracy Street substation on the incoming 60,000-volt line. The surge protector installed has been developed by the General Electric Company at its Pittsfield factory and has been on the test floor for about three years. It consists of three reactance coils, three resistance grids of calorite wire and three condensers, connected as shown in the accompanying diagram. The condensers consist of steel plates immersed in oil contained in tanks 10 ft. high and 30 in. in diameter. Each tank has an insulating bushing which extends through the top and upon which is mounted the resistance grid of fine wire. The calorite wire was used for these grids on account of its high specific resistance and its ability to resist oxidization at high temperature.

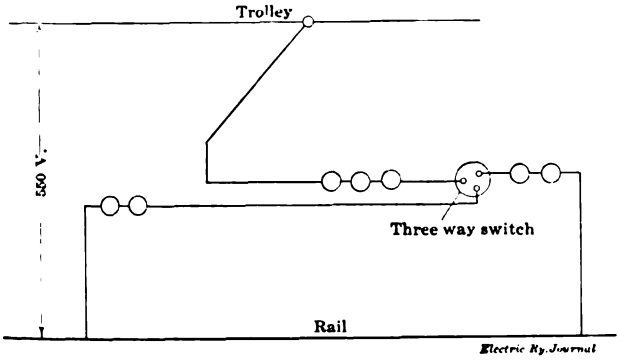
In operation the surge is impeded by the reactance coils, charging the condenser through the resistance wire, which absorbs part of the energy. When the residue is reflected from the condenser into the line, more energy is absorbed in the grids. In this way much of the trouble which would otherwise be caused by the condenser discharge is eliminated. The principle of connecting condensers to a line, ahead of transformers and back of choke coils, is not a new one, but in previous applications much difficulty had been experienced in taking care of the condenser discharge. The present scheme has been tried out in only one other place, on the lines of the Yadkin River Power Company in North Carolina. In the latter installation the necessary capacity was obtained by stringing parallel wires on transmission towers a distance of from 500 ft. to 1000 ft.

The operation of this new apparatus will be watched with interest on account of its novelty. It is planned later to obtain graphic records of surges so as to ascertain just what the apparatus is doing in cutting down the steepness of wave fronts.

Three-Way Switch on a Seven-Lamp Car Circuit

BY J. G. KOPPEL, ELECTRICAL SUPERINTENDENT OF BRIDGES, SAULT STE. MARIE, ONT.

The accompanying diagram shows a wiring scheme which was adopted on the Montreal & Southern Counties Railway, St. Lambert, Que., when the writer was power house construction foreman of the company named. These cars have standard interurban closed bodies 49 ft. 4 in. long and 8 ft. 1 in. wide and are of the combination smoking and passenger type. Three lamps are in the smoker and two lamps are on each end platform. However, only five lamps are in use at the same time, as only one platform is illuminated, according to the direction of running. On completing a run the motorman actuates the three-way switch to cut out the two lamps at the end which served as the conductor's platform and then he cuts in the lamps at the conductor's new position. Six cars were equipped in this way owing to the fact that they were originally over-illuminated.



WIRING ARRANGEMENT FOR THREE-WAY SWITCH ON SEVEN-LAMP CIRCUIT

Upkeep of Renewable Center Plates by the Connecticut Company

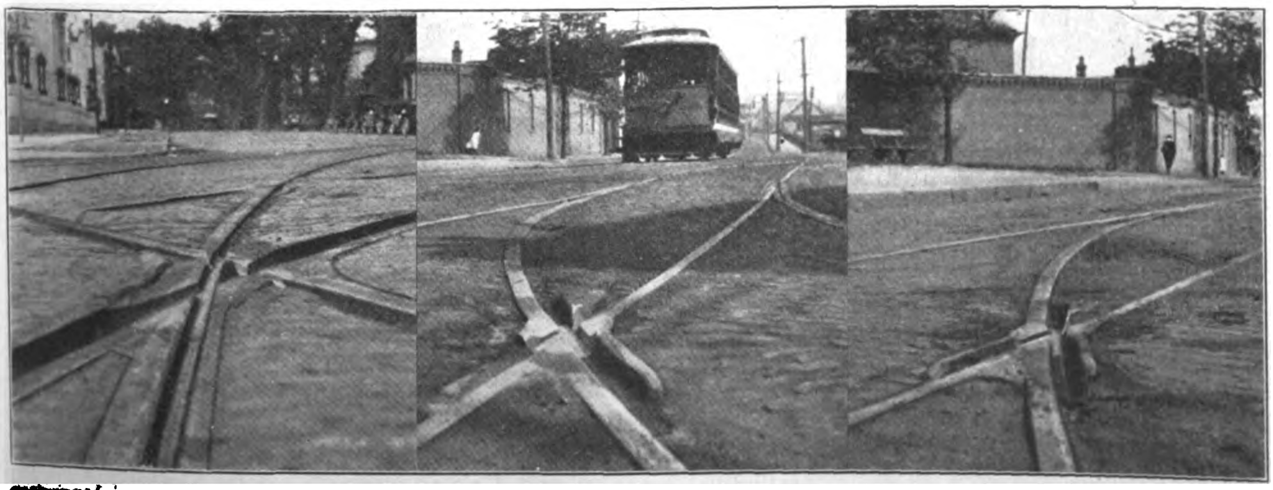
BY "CONTRIBUTOR"

On account of the present interest in iron-bound special trackwork with manganese inserts versus solid manganese pieces, it may be of interest to note that in the last five years the Connecticut Company has maintained a small gang whose duties include the upkeep of renewable center plates.

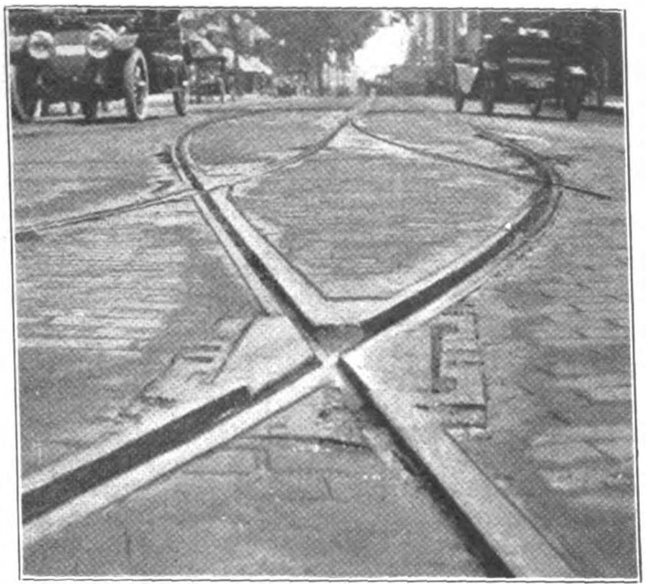
We believe that we have effected a large saving by watchfulness and care along these lines, our aim being to tighten and shim, if necessary, at the first indication of looseness, all renewable center plates in order to be sure of an even surface. The cost of constant effort in this direction is a very small percentage of the money value of special trackwork which becomes unfit for use on account of early and unnecessary disintegration.

By far the most serious thing we have to contend with is the loosening of the rails in the castings. While this is sometimes caused by loose center plates the reverse is usually the case.

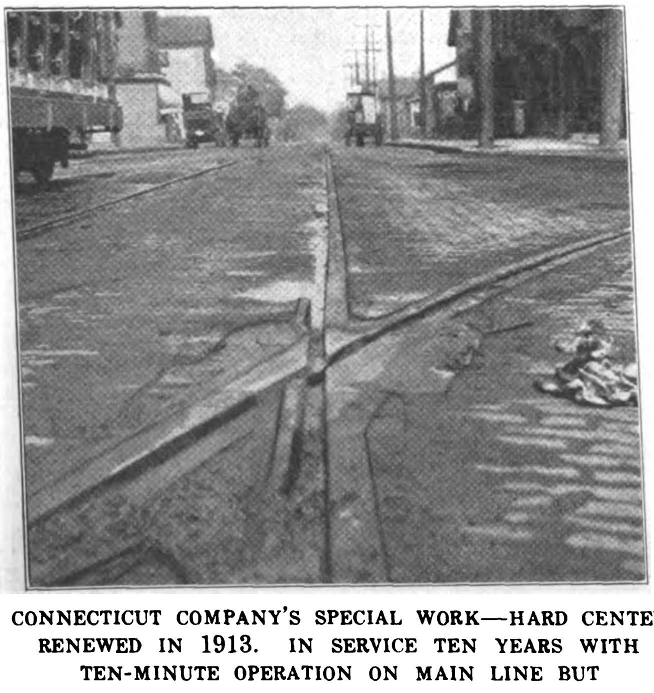
Originally it was our practice to use a heating torch to dry out the plate and the casting, but now we have done away with the torch entirely and are getting very satisfactory results. In resetting a center plate first set fire to a quantity of oily waste, placing the same in the casting immediately after the center is removed. Then clean and wipe the casting thoroughly with kerosene oil, that is to say at all points where the hot spelter will come in contact with it. After the center is properly surfaced and fastened and is ready for the spelter, pour a small quantity of kerosene into the bed of the casting and also over any clay or sand which may have been used in the grooves. Place a match at the highest point of the casting, which is always the correct point for the gate, in order to get an even distribution of metal, then pour. The kerosene is ignited and an intense heat is produced as soon as the hot spelter



CONNECTICUT COMPANY'S SPECIAL WORK—FROG IN SERVICE SINCE FEBRUARY, 1900, ON A LINE WITH TWO AND A HALF-MINUTE HEADWAY. THE CENTER PLATE RENEWED IN 1909 IS NOW IN EXCELLENT CONDITION —ALSO TWO VIEWS OF MANGANESE STEEL INSERT IN SERVICE SINCE 1899 ON A LINE WITH FIVE-MINUTE HEADWAY strikes the match. We have used this method for the past four years and have not had a single explosion, although at times we have poured spelter in emergencies during wet weather with very satisfactory results. Ladle pouring is not satisfactory, as the spelter will cool in layers; a continuous pour should always be made. To avoid accident all men engaged in the removal and the resetting of center plates should wear glasses; painful and sometimes serious injuries to the eyes may otherwise result. The best results can be obtained at night after car service is discontinued, the day gang doing the preliminary chipping and loosening. We find the "keyed-in" and the later types of bolted-in centers the most satisfactory to maintain, with the "keyed-in" fastening somewhat in the lead. When bolts are used, they will occasionally break off short in the casting and very much effort and added expense is necessary to get them out, whereas the simple method of keys or wedges avoids this trouble.



CONNECTICUT COMPANY'S SPECIAL WORK—BROKEN CENTER PLATE IN SERVICE ONE YEAR IN IRON-BOUND MANGANESE INSERT



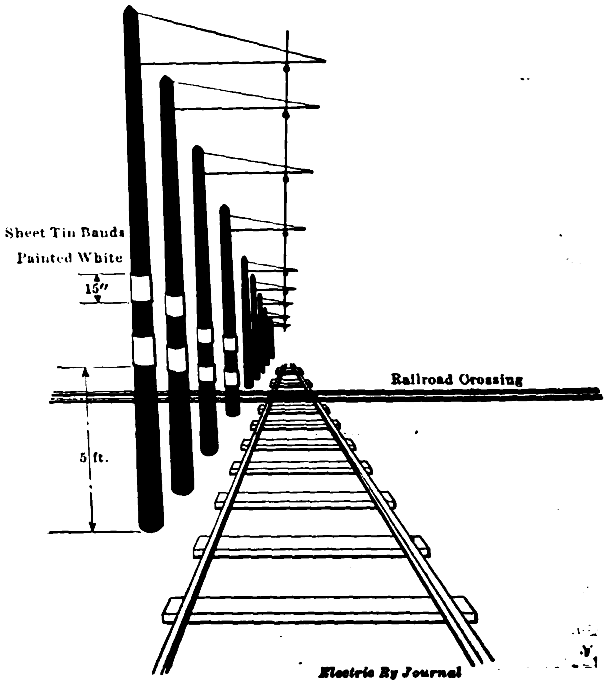
CONNECTICUT COMPANY'S SPECIAL WORK—HARD CENTER RENEWED IN 1913. IN SERVICE TEN YEARS WITH TEN-MINUTE OPERATION ON MAIN LINE BUT INFREQUENT SERVICE ON BRANCH-OFF

The performance of different hard center plates under practically the same conditions varies to such a degree as to require some explanation. The question may properly be asked, why centers in a certain layout will require no attention whatever while similar centers 200 ft. away will flow, chip, become loose and generally give unsatisfactory results. We attribute this to faulty workmanship in the construction of the pieces and to the use of manganese of inferior grade. We believe that their resistance to impact and side-wear varies to a great degree. With this in view, it is natural to expect a variety of results when solid manganese pieces are used.

Whether solid manganese or iron-bound insert work is employed it is certainly not fair to expect good results unless the special work is properly maintained. The number of loose arms in castings at a point where they join the center plate can be reduced by the use of one of the modern grinding machines. A frog, for instance, really has eight joints, and they should all be ground off smooth as required. By doing this, cupping is delayed appreciably. As a matter of fact it is the writer's belief that special trackwork, particularly, is not being maintained as it should be when one considers its great first cost. The time has arrived for refinements in the maintenance of these high-priced structures. The immediate grinding of all joints and uneven surfaces in new and old layouts will serve greatly to lengthen the life of this part of the way construction.

Warning Bands on Trolley Poles Near Crossings

A simple yet effective scheme for warning the motorman that he is approaching a crossing is employed by the Houston (Tex.) Electric Company. As shown in the accompanying illustration the four poles back of the crossing are fitted with bands of 15-in. strips of tin painted white. The lower band of the pole farthest from the crossing is 5 ft. above the ground, the pairs of bands on the succeeeding poles being lower to secure optical emphasis. At night the bands are easily seen because of the illumination afforded by the headlight.



WHITE BELTED POLES AT RAILROAD CROSSINGS

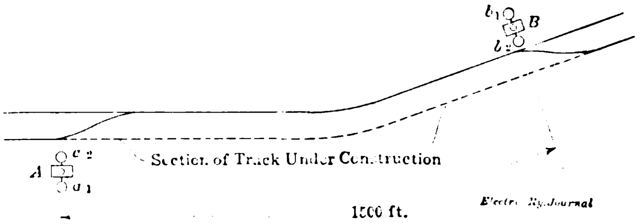
Use of Block Signals Instead of Flagmen on City Track Construction at Boston

An interesting application of automatic block signals to single-track operation is illustrated in the accompanying halftones. These views were taken recently on the Harvard Avenue, Allston, line of the Boston Elevated Railway Company's surface system. The street has recently been widened, and with this improvement the company found it necessary to relay track, traffic being carried on over a single track section during the construction period. Until last year the company has always flagged cars through such sections of single track, at a considerable labor cost. The work is now entirely handled by signals. The installation shown was provided by the United States Electric Signal Company, of West Newton, Mass., this being probably the first application of the kind with the exception of an initial trial installation made last year on Hyde Park Avenue, Boston, under similar conditions.

The section of single track involved is about 1500 ft. long. At the entering crossover at each end a type K signal has been installed, with the signal company's regular No. 5 trolley contactor. Fig. 2 shows one of these signals at close range, the equipment being mounted on a pair of wooden cross-arms U-bolted and braced to one of the trolley poles, with a third arm located at the top of the pole to carry the line wires of the signal system. The arms are the standard 6-in. x 8-in. x 6-ft. size used by the company in feeder work, and the signal is mounted about 19 ft. above the street level. Two through wires are required for the block service. Two contactors are mounted in the trolley wire near the entrance to each cross-over. The general arrangement of signals from the operating standpoint is shown in Fig. 4.

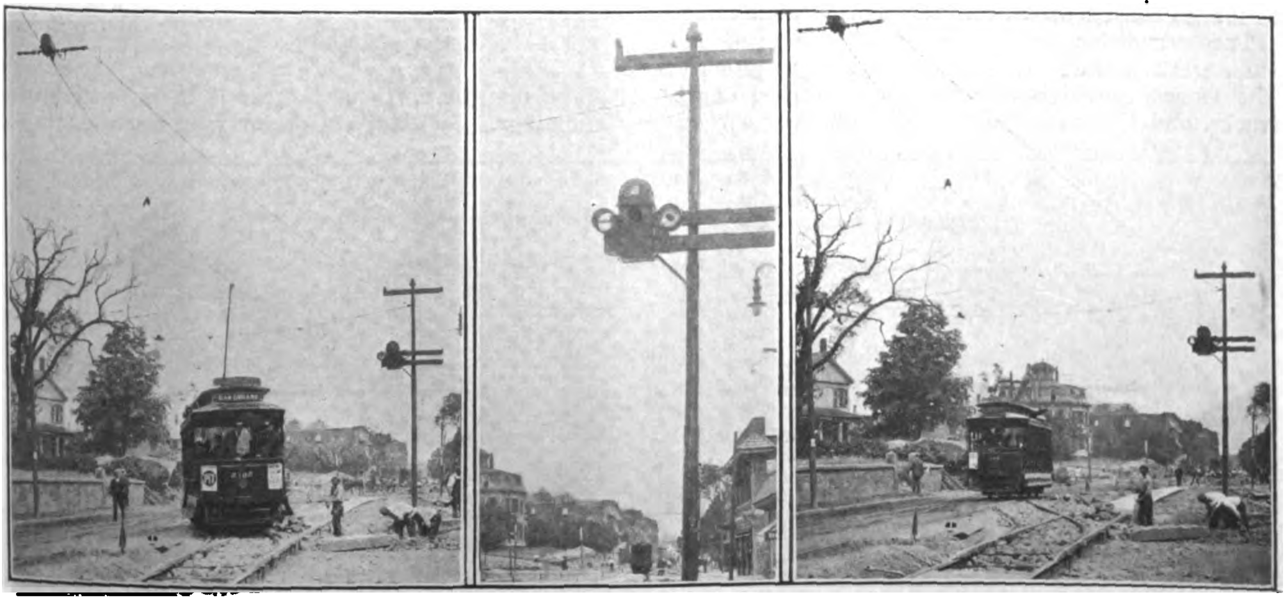
With this type of signal when the signaled section is not occupied no aspect shows. The proceed aspects consist of 8-in. illuminated disks placed on each side of the main case. A car approaching an unoccupied block will, upon passing beneath the setting trolley switch, cause a circuit to be closed to operate the signal relay. This operation cuts in a permanent feed and causes a red light to be displayed at the opposite end of the block and one of the white illuminated disks (either right or left) at the entering end. A second car following will, upon passing beneath the setting trolley switch, restore the white illuminated disk which was displayed by the preceding car and cause the disk and light on the opposite side of the case to be displayed. The white illuminated disks alternate successively in this manner as each following car enters the block, the purpose of the alternation of position being to show each crew distinctly that the signal counting mechanism has been properly operated.

At the distant end of the block a red light only is employed for a danger signal. Referring to Fig. 4 a car on entering the single track section at signal *A* sets the semaphore *a*-1 and lights the red lamp in the center of the signal case at signal *B*. A second car following the first restores semaphore *a*-1 and sets semaphore *a*-2, leaving the red or stop indicating lamp as before. The signals used at Boston are designed to count in two, four, six or fifteen cars, according to their setting when installed or adjusted later. When the last car clears the block at signal *B*, the red light is extinguished and the semaphores *a*-1 and *a*-2 are restored to their normal or horizontal position. With cars running in the reverse direction, signal *B* is operated as was signal *A* in the above instances. On lines with short headway four or six cars represent the maximum that can be passed through without seriously delaying traffic.



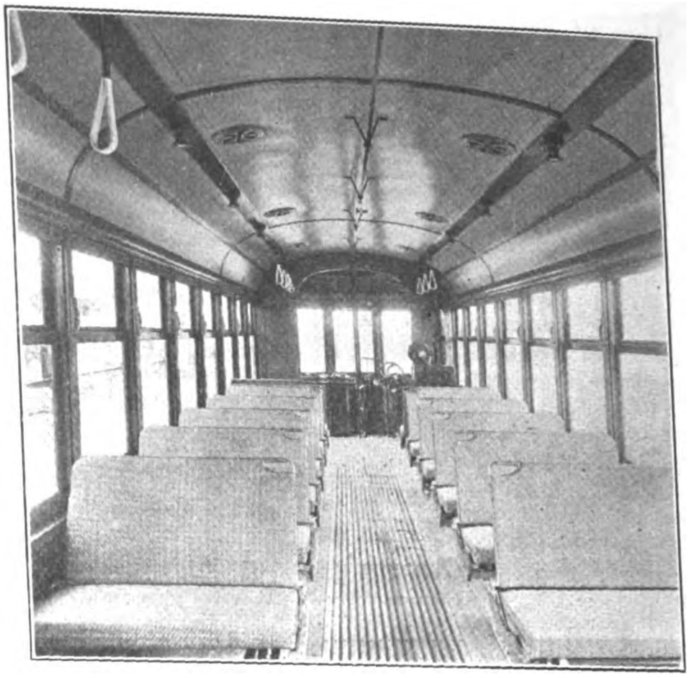
BOSTON BLOCK SIGNALS—FIG. 4—ARRANGEMENT OF SIGNALS DURING TRACK CONSTRUCTION PERIOD

On account of a curve in the track section described above, the signal installation dispenses with the services of six flagmen, three being required per operating shift. A car passes through the block in about two minutes. On Hyde Park Avenue last year four flagmen were dispensed with for two months. The cost of the signals for one block was about $400, of which the



BOSTON BLOCK SIGNALS—FIG. 1—FOLLOWING CAR ENTERING BLOCK UNDER PERMISSIVE SIGNAL. FIG 2—VIEW OF SIGNAL SHOWING CAR-COUNTING DISKS ON EITHER SIDE. FIG. 3—CAR LEAVING BLOCK installation expense represented $60. The signals can easily be moved and hence are available for use on track construction or other work at any time. As a result of its experience the company has ordered a total of nine blocks. In their operation it is necessary for work cars using the idle track to pass the trolley contacts with trolleys down, to avoid setting the signals improperly. This point must always be observed in signaling single-track sections where construction cars move freely to and from the main line, since the irregular operation of these is a matter invariably demanding attention, regardless of the type of signaling system employed.

Vestibule Prepayment Cars for Evanston Railway



INTERIOR OF NON-BULKHEAD CAR FOR EVANSTON, ILL.

The Evanston Railway serves the entire business district of Evanston, Ill., a city of 25,000 population. Its property consists of a single line of street railway with double tracks running from the southern limits of the city to the north-central district and thence westward to the city limits. The total route is about 5 miles. At the southern terminus, Howard Avenue, Chicago, the cars connect with important through routes of the Chicago Surface Lines. Since the present owners of the property obtained control two years ago the track has been rehabilitated, a new carhouse and shop building has been erected, and very recently twelve cars of the type illustrated herewith have been purchased from the St. Louis Car Company.

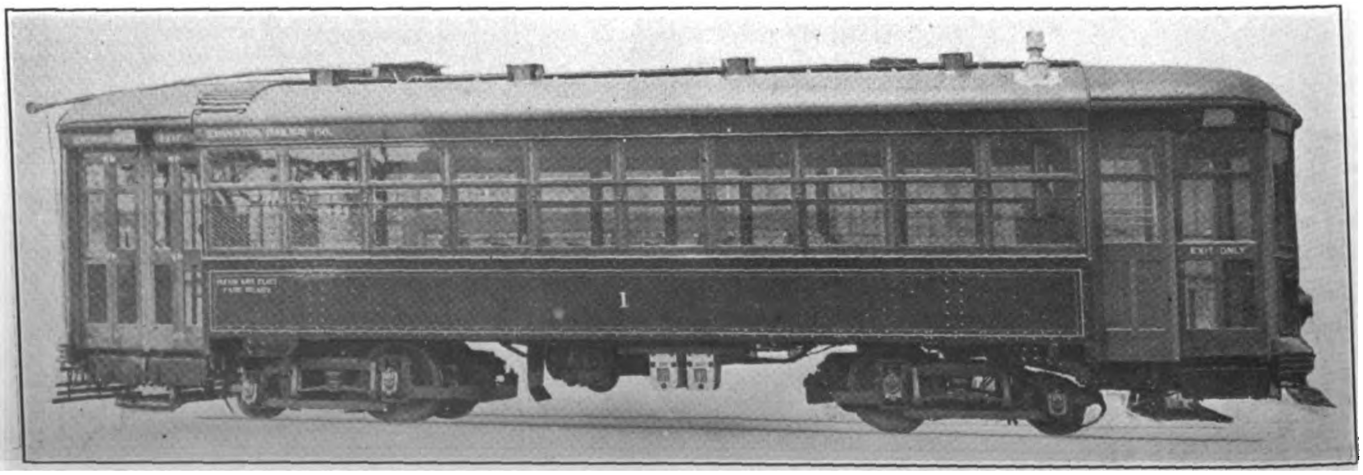
In describing these cars the company points out that the controlling feature in their purchase was the company's desire to get the very best and most complete equipment that could be bought. Quality and usefulness rather than cost were the controlling features. Due to local conditions the Evanston Railway has a great many short-haul passengers. Therefore, exceptionally large cars are not required in order to provide good accommodations for the passengers. The business, however, is sufficient to justify double-truck cars; in fact, these are required by ordinance. After some consideration of the problem of car design the management concluded that cars of the same size as those previously used would be satisfactory if much larger platforms and wider doors were used. Also, since the company buys its power, it was important in designing the car to keep the weight of the car and its equipment as low as consistent with service and durability.

These conditions brought about the choice of maximum traction trucks with their two-motor equipments. The longest possible wheelbase was ordered for the trucks, and the management states that the operation has been very satisfactory. Further, the closed door and folding-step type of car commended itself from the standpoint of safety. The design chosen has no bulkheads. The body and equipment are arranged for double-end prepayment operation under license of the Prepayment Car Sales Company.

The car has a steel underframe, drop platforms and is framed with T-iron side posts running from sill to sill in one piece. The roof is a continuous plain arch and the platforms have closed vestibules. The controlling dimensions of the body are as follows:

Length of car over the body corner posts	28 ft.
Length of car body over the dash	41 ft.
Length of car body over the bumpers	42 ft.
Length of platform to outside of dash	6 ft. 6 in.
Length of platform side opening to left of motorman	5 ft.
Length of platform side opening to right of motorman	2 ft. 6 in.
Width over the sheathing	8 ft. 6 in.
Extreme width at drip rail if storm sashes are used	8 ft. 9¼ in.
Width of aisle using 36-in. seats	25¼ in.
Height from top of rail to top of roof at center	11 ft. 6⅝ in.
Height from top of rail to floor level	3 ft. 3½ in.
Height from top of rail to tread of step, not more than	15½ in.
Height from top of car floor to top of arm rest at window sill	2 ft. 1 in.
Truck centers	20 ft.
Truck design, Brill 39-E.	
Motors, Westinghouse 536 with K control.	

The interior finish of the car is cherry with bronze trimmings. All details of design were planned with the



VESTIBULED PREPAYMENT ARCH-ROOF CAR FOR EVANSTON RAILWAY, EVANSTON, ILL.

idea of making the cars light, clean and attractive. For this reason tungsten lamps with Alba glass shades were installed. The push buttons are placed exceptionally high to be out of reach of children. The levers and mechanism which operate the sliding doors and steps as well as those which operate the folding doors and their steps, are of the car builders' design and have counterbalancing springs.

The window sashes, ten in number on each side of the car, are fitted with Edwards fixtures. The top sash is of wood and is continuous from corner post to corner post. It is fastened to the outside of the T-iron posts. Provision is made for storm sashes. The headlining, which is of 3/16-in. agasote, is divided into three panels and is tinted a light color to obtain good distribution from the ceiling lamps.

The seating plan includes twelve cross-seats, 36 in. long over all, provided with foot rests and corner grab-handles, and five stationary side seats, one of which is removable to permit the installation of a Peter Smith forced-ventilation hot-air car heater, which is located at the end of the car. The coal box is under one of the short seats near the heater. Each end of the cars has a Hedley anti-climber 7 in. high, weighing 10.28 lb. per foot. These equipments extend from vestibule corner post to vestibule corner post and form the bumper. Some of the other special apparatus in these cars is as follows:

St. Louis vertical wheel brake with Peacock-Ackley gearing; Ohio Brass air sanders; Consolidated buzzer system; Consolidated flash signal system; leather hand straps with Rico No. 2 sanitary covering; white porcelain enameled pipe platform stanchions; H. B. life guards, National air brakes and International registers.

All the woodwork used in the frame, bottom of posts and wherever inaccessible for painting, was treated with Avenarius Carbolineum. The scheme of painting adopted was the same as that used on the parlor cars of the Chicago & Northwestern Railway, which consists of green above and below the windows, with golden yellow between the windows and narrow gold striping on the lower panels. The new cars have attracted much favorable comment from local authorities and prominent residents.

Metal Railway Ties in Switzerland

In a recent issue of *Daily Consular and Trade Reports* is a report by Vice-Consul-General Frank Bohr, Zurich, Switzerland, on the use of metal railway ties in Switzerland. The information was furnished by the Central Materials Department (Obermaterialsverwaltung) of the Swiss Federal Railways in Berne.

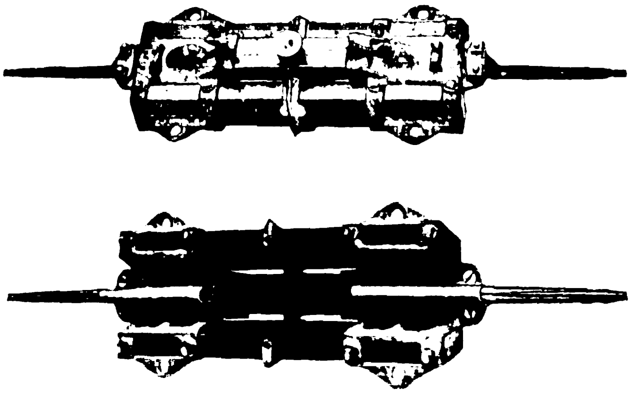
The report says that at present about 65 per cent of the Federal Railways rest upon steel ties and 35 per cent upon wooden ties. All of the steel ties have the form or profile of a trough, into which shape they are rolled in the mills. The ends of the ties are bent down and the trough profile thus closed, and from the point of the attachment of the rails the ties have a slope of 1 in 20 away from the center of the track. The ties have holes for the attachment of the rails by means of clamp plates, and no tie plates are used under the rails. The weight of the trough profile is 25.16 kg (55.47 lb.) per running meter (39.37 in.), and the ties complete with the holes already bored weigh 72.5 kg (159.84 lb.) each.

According to the requirements of the Federal Railways the steel used in making these ties must have a tensile strength of 35 to 45 kg (77.16 to 99.21 lb.) per square mm (0.00155 sq. in.), and the coefficient of quality, or the product of the tensile strength and the ductility expressed in percentage, for lengths of 200 mm (7.874 in.) must be 900. Furthermore, an entire trough piece shall admit of being bent together on its back without showing any breaking fissures. For a year or more the Federal Railways have been installing, at the junction points of the rails, double-trough steel ties instead of two ordinary single-trough ties. These double ties are of the same material as are the single ties, and the rails are attached in the same manner, but they weigh 125 kg (275.58 lb.) each.

The Central Materials Department expresses the wish to receive information descriptive of steel railway ties that are manufactured in the United States.

Triple Beam Section Insulator

The Drew Electric & Manufacturing Company, Indianapolis, Ind., has just put on the market a new section insulator. It has two main side beams of second growth seasoned hickory, treated with a wood preservative to make it impervious to moisture. Heavy bronze castings are provided for each end of the insulator, and these have slots into which the side beams are fitted and anchored with machine bolts. These castings are made to accommodate Drew standard flexible approaches to insure a smooth underrun. The wire is brought into each of the end castings on nearly a straight line and is then securely locked into these castings by means of corrugated wedges which have lugs on the ends so that they can be knocked out with a hammer in case it is desired to remove the insulator.



TOP AND BOTTOM VIEWS OF TRIPLE BEAM SECTION INSULATOR

While the method of attaching the ends of the wire to the ends of the insulator minimizes buckling, the third or middle beam of hickory shown in the top view relieves the stresses due to excessive lengthwise strains. This middle beam fits into cored recesses in the end castings, and at the same time gives a solid underrun for the trolley wheel, which crosses the break section, as shown in the bottom view, on a runner of vulcanized fiber. This fiber runner is laid up against the middle beam, is fitted into slots of the end castings and is secured by means of small flathead machine screws, making it easily removable and renewable in case of wear.

The insulator is 32 in. over all, including approaches, and weighs 17 lb. As illustrated, it has a suitable hanger boss for attachment to the span wire or mast arm. The construction is such that it is amply strong for trolley wire up to and including No. 0000. On each side of the end castings ears are provided for attaching strain guys if desired. The insulator is said to be non-arcing and smooth under-running.

News of Electric Railways

Hearing of California Commission on Calhoun Note

The investigation being conducted by the California Railroad Commission into the finances of the United Railroads of San Francisco, especially into the circumstances surrounding the investment by the company of $1,096,000 in the securities of Solano Irrigation Farms Company, was begun on July 20. As previously published in this paper, the investment was made by Patrick Calhoun, president of the company. Later, upon the request of the directors, Mr. Calhoun gave his personal note for this amount, protected by the securities of the Solano Irrigation Farms Company as collateral, the note later being carried in the assets of the company at $1.

At the hearing on June 20 Jesse W. Lilienthal presented the proposal of the board of directors—which was that the California Railway & Power Company, which controls the United Railroads and is itself controlled by the United Railways Investment Company, should acquire the Calhoun note from the United Railroads and in exchange for it give the United Railroads common stock of the United Railroads which the Power company holds in its treasury, having the par value of $7,950,000. The Power company now owns all of the common stock of the United Railroads, amounting to $17,948,600. Testimony at the hearing showed that the property of the Solano land company is located about midway between San Francisco and Sacramento, being about 50 miles from each city, and that the operation of the company had no apparent connection with the operation of the railroad; also that the money was invested without the knowledge of the directors and was paid in a large number of small amounts on vouchers made by Mr. Calhoun and drawn in the regular way, the treasurer's balance showing the amount so invested as cash. The large amount of money drawn and its use in the land project was discovered only in June, 1913, by Charles N. Black, vice-president of the United Railroads, who immediately advised the directors of the company. Mr. Calhoun was then called to New York to discuss the matter with them. Prior to that time the directors had considered Mr. Calhoun the best informed man regarding the financial needs of the company, so that he had a wide discretion in the direction of the financial affairs of the company. During the hearing the auditor of the commission claimed that the company's books showed a total deficit of $4,880,471, and of this amount he could not account for $3,906,909. After this statement was made by the auditor, Vice-President Black said that the company's auditor would be able fully to account for the last named sum, and the hearing was adjourned until June 28 to allow him to prepare his report.

The commission did not express any opinion as to whether it would accept the offer of the substitution of the common stock of the United Railroads for the Calhoun note, but intimated that if the amount which it considered a deficit in the accounts of the company was not made up in the way which it considered satisfactory it would issue an order stopping the company from paying any dividends. The common stock of the United Railroads is not now paying any dividend. The commission and the company for some time have differed in the proper location of the reserve accounts in the balance sheet, the company's auditors asserting that a reserve should be carried only on the liabilities side of the balance sheet, whereas the commissioners assert there should be a corresponding entry in both the liabilities and assets accounts. It has been suggested that the difference of accounting may explain a portion of the deficiency claimed by the commission.

Mason B. Starring, president of the United Railways Investment Company, made public in San Francisco last week a statement in regard to the situation. He said:

"The application of the funds of the railroad company to such project was made, so far as I know or can ascertain, without knowledge of any officer of the California Railway & Power Company, the United Railways Investment Company, or the Railroads & Power Development Company or of any director thereof other than Mr. Calhoun. He made such application on his own initiative and took full responsibility therefor. During a part of July and August, 1912, I was in California for the purpose of inspecting the railroads and the power companies in which said companies were interested, and to that end traveled through a large part of the country adjacent to their territory, including that part of the Sacramento valley in which the Solano project was subsequently located.

"Neither at that time nor at any other time until about a year ago had I any knowledge of any such application of the funds of the United Railroads of San Francisco, or of any intention on the part of any one to use such funds in or for any land project or to loan to any one any such funds for such purpose. No resolution or resolutions were intended to confer authority on any one to use moneys of the railroad in any such way.

"When I first heard of the Solano project I understood that it was being carried on with the personal funds of Mr. Calhoun and such individual investors as he had been able to interest in the matter, and I remained in this belief until the discovery, about a year ago, that the money of the United Railroads had been used, as Mr. Calhoun stated in New York substantially coincidentally with the time of discovery, without our knowledge. Such application of the moneys of the United Railroads of San Francisco was foreign to any views held by the officers or respective boards of directors of the companies herein named, and contrary to what they understood had been established as the fixed policy of the railroad—namely, to conserve its funds and apply them solely to the improvement of its property, the reduction of its debts and the payment of such reasonable dividends as its earnings might warrant.

"I believe, and can find no evidence to the contrary, that no officer or director other than Mr. Calhoun, or any of the three companies of which I am president, was or is interested in the Solano project directly or indirectly. When the Solano transactions became known here prompt steps were taken to repudiate them and to effect such changes in the management of the United Railroads Company as would put beyond possibility any further such application of its funds, and to secure it so far as possible against loss.

"The statement of May 25, 1914, made by President Lilienthal, correctly represents the situation and states the policy which he laid down and which received and receives our approval, in the hope that Mr. Calhoun might be able so to develop his project as to secure full repayment to the railroads. I made substantially this statement to the respective boards of directors of the three companies, but so far have not published it. You, however, are now authorized to make the statement for those companies and for myself, at such times and in such manner, and to such persons or otherwise as in your discretion may seem fit."

At the annual meeting of the stockholders of the United Railroads held July 14, the following directors for the ensuing year were elected: A. W. Foster, Henry T. Scott, A. H. Payson, Benjamin S. Guinness, J. C. McKinstry, Washington Dodge, L. P. Sherman, John A. Buck, C. N. Black, George B. Wilcutt and Jesse W. Lilienthal. These directors chose the same officers as last year. Jesse W. Lilienthal was elected president; C. N. Black, vice-president; George B. Wilcutt, secretary, and A. M. Dahler, treasurer.

Proposed Report on Detroit Transportation

As announced in the ELECTRIC RAILWAY JOURNAL of July 18, the Board of Street Railway Commissioners of Detroit has presented to the Common Council the name of the firm of Barclay Parsons & Knapp, New York, as its choice of engineers to advise the city as to the proper policy to be pursued with respect to the construction of rapid transit lines and to prepare plans for such subways as may be found necessary. Several interviews have been held between the board and W. B. Parsons and H. M. Brinckerhoff, members of the firm especially experienced in subway construction and management, and a letter has been sent out by the firm to the board submitting in full the outline for the proposed investigation. According to this letter, it will be necessary to procure the following information:

"1. An analysis of the growth of the city by municipal divisions and the present and probable future location of industries and of business sections, and a consideration of commercial conditions localizing traffic.

"2. An analysis of the existing traffic situation and conditions.

"3. An analysis of the question of a subway system and other means of improving street traffic conditions.

"4. A study of sub-surface conditions and abutting property interference, sewers, ducts and pipes."

On the basis of the above investigations, the firm promises to submit a synopsis of the information received and a report covering:

"(a). General plans indicating in what ways the traffic conditions of Detroit can be improved, more particularly in the congested area adjacent to the city hall.

"(b). Plans in sufficient detail to be self-explanatory, showing what subway or subways could be constructed with advantage, either now or in the near future.

"(c). Estimates of cost for constructing the subway, subways or other improvements.

"(d). A discussion of the value of the proposed subway or other improvements in actual earning capacity and in the light of its value to the public."

The opinion of Barclay Parsons & Knapp will be given in an illustrated printed report. The firm has offered to submit a model, if necessary, so as to indicate more clearly to the layman the details of the proposed construction. On the basis that the Board of Street Railway Commissioners will place at the service of the engineering firm all street surveys and the like and provide local offices, the price for the investigation is set at $32,000. The Board of Street Railway Commissioners, however, has requested the Common Council to appropriate $35,000 to defray the expenses of the investigation. The matter has been referred to the committee on ways and means and public utilities.

Six New Rapid Transit Contracts in New York

During the week ended July 18, the Public Service Commission for the First District of New York executed six contracts for the construction of sections of the rapid transit railways embraced in the dual system, aggregating $21,035,185. Among these were the contracts for the construction of the East River tunnels from downtown Manhattan to Brooklyn, the largest let in New York City since the construction of the existing subway. The contracts for these two tunnels totaled $12,444,726, $6,469,916 being the bid price for the Interborough tunnel, extending from Old Slip, Manhattan, to Clark Street, Brooklyn, and $5,974,810, the price for the New York Municipal Railway Corporation's tunnel, extending from Whitehall Street, Manhattan, to Montague Street, Brooklyn. The contracts were awarded to Booth & Flinn, Ltd., and the O'Rourke Engineering Construction Company, who submitted a joint bid. These companies have now formed a new company, known as the Flinn-O'Rourke Company, which will proceed with the tunnel construction work.

Other contracts executed were as follows: Section No. 1 of Route No. 12, being a part of the Eastern Parkway subway in Brooklyn, four tracks for operation by the Interborough Rapid Transit Company and two by the New York Municipal Railway Corporation. This section was awarded to the Cranford Company for $2,195,296. Section No. 2 of Route No. 20, the Canal Street subway in Manhattan, for operation by the New York Municipal Railway Corporation, was let to the Underpinning & Foundation Company for $1,822,994. Section No. 7 of Route No. 5, the Lexington Avenue subway in Manhattan, for operation by the Interborough Rapid Transit Company, extending under Lexington Avenue from Forty-third to Fifty-third Street, was awarded to the Rapid Transit Subway Construction Company for $1,915,165. Section No. 2 of Route No. 4 and Route No. 36, the Broadway subway in Manhattan, extending under Broadway from Twenty-sixth to Thirty-eighth Street, for operation by the New York Municipal Railway Corporation, was let to the U. S. Realty & Improvement Company for $2,657,005.

The commission has approved of certain modifications in the contract for the reconstruction of the existing Sea Beach elevated railway in Brooklyn. The New York Municipal Railway Corporation recently let the contract for part of this work to the Wilson & English Construction Company. The contract is now modified, however, to include the construction, by the same contractors, of a signal tower located near Sixth Avenue. G. W. McNulty, Inc., has the general contract for the reconstruction work on this line, and the entire work must be completed within seventeen months from Oct. 6, 1913.

The Interborough Rapid Transit Company has applied to the commission for permission to award a contract to the Terry & Tench Company, Inc., the Snare & Triest Company and the T. A. Gillespie Company for the construction of its elevated railway extensions in the Bronx. These companies now have the contract for the installation of additional tracks on the present elevated lines. The proposed contract provides that the companies shall do the work at cost plus a percentage, the percentage to be named by the commission, but not to be less than 12½ per cent of the actual construction cost. Action has been deferred pending further investigation by the commission.

Hearing on Toledo Franchises—Proposed City Charter

Not much real work was done by the Toledo Council franchise committee at the meeting on July 20, which was called for the discussion of the four franchise proposals placed before it. These are the original Doherty proposal, the drafts prepared by the Citizens' Franchise Association and the Non-Partisan League and the one arranged by the Council franchise committee. In addition, a municipal ownership ordinance has been initiated and is now being discussed before the voters.

J. R. Cowell, former director of public service, and Ben E. Johnson, attorney, explained the various sections of the proposal prepared by the Non-Partisan League. This proposal, as explained in the ELECTRIC RAILWAY JOURNAL of July 18, provides for a sliding scale of fares, depending upon the condition of the interest fund, similar to the Cleveland plan, and a rate of income on the investment increasing or decreasing inversely with the rate of fare. After hearing the explanation of the proposal, the committee went into executive session, considered a few sections of the document and then decided to meet again on July 22 to discuss the remainder.

It is said that the committee may decide to place the three alternative proposals before Henry L. Doherty, chairman of the board of directors of the Toledo Railways & Light Company. Chairman Dotson has suggested this step after such revisions of the proposals as the committee may desire to make. Another suggestion was to the effect that the committee endeavor "to agree with Mr. Doherty" as to which general basis of fare is the most satisfactory and negotiate on that basis.

It is reported that a suit will be filed in the Common Pleas Court to enjoin the proposed election on Aug. 4 on the question of the municipal ownership ordinance. This was agreed after a conference between John H. Doyle of the Citizens' Franchise Association and City Solicitor Thurston and the refusal of the latter to accede to the demand to enjoin the members of the board of elections from holding the election as planned. The instigators of the suit claim that the petitions filed to initiate the proposed municipal ownership ordinance are illegal.

Under the proposed charter for the city of Toledo, which has been completed and upon which the electors will vote at the regular autumn election, Toledo will have a department of public utilities. The director in charge will supervise all tax-supported utility undertakings, including power and transportation facilities, and enforce all laws relating to privately owned utilities. Rates for service under the charter shall be fixed in the manner provided by ordinance of City Council.

Separate accounts shall be kept of the business of all utilities owned and operated by the city and dependent for their revenue upon the sale of their own products or service. These accounts shall contain proportionate charges for all services rendered such utilities by other departments of the city government. It is the intention that each shall be operated as a separate institution.

Under this charter franchises may be granted to utilities to operate in the streets and public grounds, subject to the general law requiring the consents of owners of abutting property. The grant shall provide the kind and quality of product or service, the rates to be charged and the manner in which the streets and public grounds shall be used. Such grants may be renewed and both original and renewal grants are subject to a referendum vote. No grant thus made shall be exclusive. All such grants or renewals shall reserve to the city the right to purchase or lease all the property of the utility, according to the terms provided in the grant. The city may also acquire such property by condemnation proceedings, but this shall be alternative to the power to purchase.

Permission for extensions and improvements may be secured, but such extensions shall become a part of the general property, and all rights with respect to them shall terminate with the original grant. The City Council shall have complete control of the streets occupied by any public utility and also the distribution of space over, under or across them. The property of a utility is subject to relocation, removal or reconstruction, if deemed necessary by the City Council.

Portions of property lying without the city become subject to the terms of the grant on annexation of the territory concerned. Companies make detailed periodical statements of their business and the operation of the property, as may be directed by the City Council. Should any company take action to have any portion of its grant changed or voided, the city may declare the entire grant nullified. This gives the city power to enforce all contracts, but does not make the result mandatory.

Final vote on the proposed charter as a whole by the charter commission has been postponed until Aug. 13.

Suit Ordered Against New Haven Railroad

President Wilson on July 21 directed that a bill in equity be filed against the New York, New Haven & Hartford Railroad and that the criminal aspects of the monopoly maintained by this company in New England be laid before a federal grand jury. On July 23 suit was filed in the United States District Court in New York, and it is expected that within a fortnight a special grand jury will be impanelled for the criminal proceedings.

According to a statement issued by J. H. Hustis, president of the company, a proposal was made on July 20 to the Department of Justice that the Boston Railroad Holding Company, which has title to the Boston & Maine stock, be put into the hands of trustees agreed upon for that purpose until the Massachusetts Legislature had removed some of the conditions imposed upon the disposal of the Boston & Maine stock. It is understood that the intention of the New Haven directors was to concede all other points that would be raised in a suit under the Sherman law, assuming that these would be the same as those covered by the dissolution agreement affecting steamboats, trolleys and other properties. If this is correct the net result of the filing of suit by the government is about the same as if Attorney-General McReynolds had accepted the proposal that the point concerning the Boston & Maine stock be adjudicated separately by the federal court.

Samuel T. Bodine, president of the United Gas Improvement Company, Philadelphia, Pa., has issued the following statement regarding the Rhode Island trolley properties sold by his company to the New Haven:

"It was a perfectly straightforward transaction. No influence whatever was brought to bear on Mr. Mellen or other officers, or the directors of the New Haven to induce them to make the purchase. We were not seeking to sell the property, having made improvements in its physical condition and operating results. The other side were so urgent to have a price named that we finally named it, and naturally in arriving at the price we discounted the future to a certain extent. It was the case of an eager purchaser and a reluctant seller."

Detroit Lines Make Petition for Appraisal

An application has been made by the Detroit United Railway to the Michigan Railroad Commission for a complete appraisal of its properties, and of the interurban properties controlled by it through stock ownership, viz.: Detroit, Jackson & Chicago Railway, Detroit, Monroe & Toledo Short Line Railway, and Detroit & Port Huron Shore Line Railway. It is represented in the petition that the respective companies have exhausted the bonds issuable under authorized and existing mortgages in the course of the construction, enlargement and development of their properties, and that a necessity exists for a reorganization of the properties in the matter of securities to provide additional funds for continued enlargement and development.

The petition states that the Detroit United Railway has outstanding its entire authorized issue of capital stock, $12,500,000, $25,000,000 in bonds and $2,000,000 in two year notes. It owns about 441.597 miles of track. It owns the entire capital stock, to wit: $2,000,000 of the Detroit & Port Huron Shore Line Railway; $2,581,000 of the Detroit, Monroe & Toledo Short Line Railway, and $25,000 of the Detroit, Jackson & Chicago Railway, as well as various other equities in these and other companies. The Detroit & Port Huron Shore Line Railway owns 132.726 miles of track. It has issued its entire authorized capital stock of $2,000,000, and has outstanding its entire authorized bond issue of $2,890,000. The Detroit, Monroe & Toledo Short Line Railway owns 79.51 miles of track, has issued its authorized capital stock of $2,581,000, and has outstanding $2,941,000 of its total authorized bond issue of $3,000,000. The Detroit, Jackson & Chicago Railway owns 108.138 miles of track. It has issued its entire authorized capital stock of $25,000 and its total authorized bonds of $4,000,000.

The petition points out that the Detroit United Railway is committed to the building and equipping of about 20 miles of new railway in Detroit, and about 14 miles of new railway outside of Detroit, and that it has under way plans for the double tracking of about 40 miles of interurban lines. For the purpose of carrying out these undertakings it will be necessary to issue and sell securities in a sum exceeding $5,000,000 in the form of either stocks or bonds secured by a mortgage.

An order will be issued by the State Railroad Commission for the appraisal to be made, according to Chairman Hemans, under whose jurisdiction such matters fall. The cost will be borne by the Detroit United Railway, as provided by Michigan statutes. The appraisal will be in charge of Dean M. E. Cooley of the University of Michigan, who is in charge of such work for the commission.

The commission, it is understood, will order an appraisal on the basis of reproduction value and also of present value. Each property will be appraised separately and reports will be made to the commission at short intervals as to the progress of the work.

Half-Fare Operation Begun in Kansas City

The half-fare provision for children between the ages of eight and twelve years was put into force by the Metropolitan Street Railway, Kansas City, Mo., on July 20. Half-fare tickets were given general distribution at that time through conductors and business houses in various parts of the city. There is little need for outside distribution, however, as conductors, when receiving a nickel from a passenger entitled to the discount, merely return one of the coupons. Universal transfers are given with the half-fare tickets as well as with full fares. Children under eight years of age may ride free, if accompanied by a passenger paying a fare, even if the latter happens to be between the age of eight and twelve years and is riding on half fare. Half fares are not applicable to traffic originating in Kansas City, Kan., although R. J. Higgins, counsel for that city, has announced he will make an effort to force the adoption of the half-fare system on the Kansas side. The daily papers of July 19 carried advertisements explaining the new system in detail, at the order of the receivers for the company.

P. J. Kealy and Robert P. Woods, members of the board of control for the Kansas City Railways and the city, under the new franchise, returned to Kansas City on July 20 from an inspection trip of roads in the East and Middle West. They immediately took up the question of the location of the proposed central interurban passenger station. Four sites have been proposed and big bonuses are offered by business men interested in the location of the depot. For instance, $500,000 has been offered by business interests desiring the station to be erected at Tenth and Wyandotte Streets. The interurban officials themselves have expressed no particular concern over the location, merely desiring one which will allow proper routing without running over the trunk lines of the local railway.

The Nelson papers have continued their attempts to prove the perpetration of frauds at the recent election, apparently in the hope of influencing the State Public Utilities Commission in its conclusions. The residents who, according to the Nelson papers, knew of fraudulent voting, have failed to materialize for any hearings on the subject.

The name "Metropolitan Street Railway" will be technically banished when the successor company, the Kansas City Railways, is incorporated. This company will then proceed to purchase all the property of the Metropolitan Street Railway and its subsidiaries, for which it is obligated to pay $28,700,000, the present bonded debt of the companies. It is contemplated that six months will be required to do this.

The two members of the board of control will act under the receivers until the legal task of clearing the receivership has been performed. The receivers, however, have already agreed to operate under the terms of the new contract until their work is completed. In the meantime the city will participate in the net earnings of the company. Improvements and extensions to be made under the contract will be carried out as far as possible until the company is placed on a sound financial basis. While the company is being financed anew, there will be no change in the personnel of the Metropolitan Street Railway officers, according to Mr. Kealy. The board of control, however, has authority to recommend and demand such changes as it deems proper. Mr. Wood states that the board will endeavor to operate on an economic basis in an endeavor to keep down expenses.

R. J. Dunham, one of the receivers of the Metropolitan Street Railway, was elected president of the Kansas City Railways on July 20, following a meeting at which the company's six directors were chosen. Ford F. Harvey was made vice-president, and E. E. Ball, an attorney in the office of Frank Hagerman, secretary-treasurer. The directorate for the company includes, besides Mr. Dunham and Mr. Harvey, Frank Hagerman, E. F. Swinney, Charles W. Armour and Clyde Taylor. The city's directors are William T. Kemper, John H. Wiles, D. M. Pinkerton, Frank C. Niles and John W. Wagner.

Electric Division of New Haven Begins Operation

On July 10 the electrified division of the New York, New Haven & Hartford Railroad, extending for 74 route-miles between New York City and New Haven, was placed in regular operation. The line includes the four-track route between the Grand Central Terminal and New Haven, together with the six-track branch from New Rochelle to the Harlem River that is used mainly for freight service. Operations began with the use of electric locomotives for the Knickerbocker Limited and several Boston expresses that make the 74-mile run in one hour and forty-five minutes, and by July 14 a total of eighteen electric trains were in operation each way. On July 19 all Sunday trains were placed permanently in electric operation, and, during the week of July 20, all passenger service on the division, except eight through trains and four local trains between New York and New Haven, was served by electric locomotives. The latter trains will be operated by steam until some time in September, as there are not enough electric locomotives in service at present to haul them.

In addition to the passenger trains six freight trains each way daily are being hauled by electric locomotives. These include one scheduled train consisting of 120 cars and averaging 2500 tons in weight. This runs daily between Bridgeport and the Harlem River, a single electric freight locomotive serving to haul it. A number of freight trains ranging between 2800 and 3000 tons have been operated at various times during the trial period with two electric units coupled and operated by one crew. It is stated that the present power plant can supply sufficient power to operate electrically all trains on the New York-New Haven division, but as a considerable part of the New Haven yards is not yet equipped with overhead construction, only a limited number of freight trains can be handled.

Progress of Strike in Joplin

Indications on July 18, the twelfth day of the strike of the employees of the Joplin & Pittsburg Railway, Pittsburg, Kan., were for a long but peaceful struggle between the men and the company. William A. Satterlee, general manager of the company, announced that the company would await the pleasure of the employees in taking up negotiations looking to a settlement. No violence has characterized the disagreement, for the company decided to cease operations entirely until the employees showed evidences of a desire to resume work. Mr. Satterlee attributes the trouble to a great extent to the fact that his road pierces a coal district, where miners are without exception union men. As noted in the ELECTRIC RAILWAY JOURNAL of July 18, the employees demand an increase from 26 to 40 cents an hour, with stipulations regarding the right of the company to discharge employees.

Employees of the company are accepting the situation joyously rather than philosophically. The various departments have organized ball clubs and a series of games is being held. Daily meetings have been held at Joplin, Mo., by the strikers, this being the only indication that they are interested in the situation. Governor Hodges of Kansas says that he will take no action unless violence develops.

The fact that steam roads operating in this district have installed special service has relieved the situation to some extent, particularly in regard to freight traffic. Mineral, Kan., however, is without electric power, the same being true of several adjacent towns.

Company Forced to Abandon Power Plant.—The Monongahela Valley Traction Company, Fairmont, W. Va., is reported to be about to abandon its $300,000 power plant at Fairmont and build a new gas engine plant at Hutchinson, W. Va. Contamination of water in the West Fork River owing to acids from chemical plants is said to be the cause for this action.

Florida Blue-Sky Law Upheld.—The Florida Supreme Court on July 14 handed down a decision holding that the blue-sky law regulating the sale of stock of companies is constitutional. This decision was the result of a test case made by C. H. Taylor of Jacksonville, to whom was refused a permit to sell stock of a certain company which had not complied with the law.

Branch I. C. C. Office Opened.—The Interstate Commerce Commission has opened a branch office in St. Louis, Mo., from which the commission's activities will be directed throughout the territory east of the western boundary of Colorado, north of the Gulf of Mexico and west of the eastern boundary of Tennessee. The St. Louis office will be in charge of Examiner F. S. Fowler.

Municipal Line Seeks Relief from Depreciation Charges.—The City Council of Brandon, Manitoba, recently asked the Public Utilities Commission to relieve it from providing a depreciation allowance in respect to the municipal railway for one year. The Council asserted that the line is a comparatively new one, that the city is providing a sinking fund and that the revenues from the line are at the present time small.

Storm Damage in Louisville.—Severe wind and electrical storms in Louisville, Ky., during the week of July 13 played havoc with electric railway schedules. Around Louisville, service was discontinued for some time, wires and equipment being damaged and two Brook Street cars being struck by lightning. In Henderson, a cyclone unroofed the municipal electric plant, which furnished power to the city system and the Evansville, Ind., interurban system.

Chicago Traction Wage Differences.—Differences between the North and West Side street car men of the Chicago Surface Lines have reached such a point that the arbitration board that made the present wage award has been reconvened. The employees assert that wages in certain classes were reduced before and after the merger of the surface lines. Chief Justice Orrin N. Carter, Judge K. Scanlon and Herbert B. Fleming are the members comprising the arbitration board.

Arbitration as to Value of Toronto Stub Line.—The Ontario Railway and Municipal Board on July 17 granted the application of the city of Toronto for an order authorizing the Toronto & York Radial Railway and the city of Toronto to submit the question of a price for the Queen Street East stub line to arbitration to determine the value of the physical assets. The representatives of the company and the counsel for the city have decided to come to some agreement as to the worth of the line.

Butte Electrification Project Held Up.—For over a week no work has been done on the transmission line of the Chicago, Milwaukee & St. Paul Railway between Three Forks and Deer Lodge, which was to be completed within a year. The electrical workers employed asserted that electrical workers should be used in setting transmission poles and should be paid $5 for an eight hour day, and demands to this effect were made through a local branch of the American Federation of Labor. The railroad refused to make any agreement for labor except with the men actually in its employ.

To Begin Campaign for Hydro-Electric Lines.—A meeting was held on July 16 in the office of the Ontario Hydro-Electric Power Commission in Toronto to discuss the proposed hydro-electric municipal railway scheme broached several months ago, as noted in the ELECTRIC RAILWAY JOURNAL of Jan. 31. It was decided to inaugurate an educational campaign in York County and other districts, and a committee was appointed to arrange for the holding of thirty meetings at which prominent speakers will present the matter to the people. It is expected that the proposed bill to guarantee the bonds of the commission, amounting to $2,000,000, will be submitted to the electorate on Sept. 21.

Attempt to End Hazleton Trolley Strike.—John P. Jackson, head of the Pennsylvania State Department of Labor, and Dr. Steese, member of the board of mediation of that body, visited Hazleton, Pa., on July 16 in an endeavor to settle the trolley strike, the progress of which was described in the ELECTRIC RAILWAY JOURNAL of July 18. A conference was held with the officials of the Lehigh Traction Company and later with the strikers. The strike situation remains practically the same, however, and from present indications the contest will be fought out on the lines indicated by the attitude of each side since the inception of the dispute.

Foreign Trade Council for United States.—As a result of the recent foreign trade convention in Washington on May 27 and 28, a foreign trade council has been established to advance the export trade of this country. James A. Farrell, president United States Steel Corporation, is chairman, and the membership consists of executives of prominent manufacturing companies throughout the country. Another convention will be held in New York in the early autumn, and one of the first official actions will be the appointment of a committee to co-operate with the committee of the Chamber of Commerce of the United States of America.

Proposal Affecting Common-User Rights in Seattle.—A resolution has been introduced in the Seattle (Wash.) Council directing the corporation counsel to enforce the common-user rights over the tracks of the Puget Sound Traction, Light & Power Company for the cars of the Highland Park & Lake Burien branch of the Seattle Municipal Railway, in order that the north terminus may be at Spokane Street and First Avenue South, instead of at Riverside Avenue. The resolution was referred to the city utilities committee. An ordinance was also introduced providing for the issuance of public utility bonds to cover the cost of extending Division "A" of the municipal line into Ballard. This was referred to the committee on finance and city utilities.

Contract for Newark Terminal Awarded.—A contract involving $2,000,000 was awarded on July 17 to the Heddon Construction Company for the erection of the Public Service Railway terminal in Newark. The structure is to be ready for occupancy by January, 1916. Actual operations cannot be begun much before next March, because under the contract recently let to the Holbrook, Cabot & Rollins Corporation for the excavation, foundation and the subway leading to the terminal, that company has nine months to complete the foundations. The building will be eight stories high, of irregular shape, and will be built of steel, limestone and brick. Its frontage of 184 ft. on Park Place will be faced with limestone. The subway, concourse and elevated train floors will cover a ground area of 70,000 sq. ft. and the office floors will cover 30,000 sq. ft. This proposed terminal building was described in detail in the issue of the ELECTRIC RAILWAY JOURNAL of Feb. 8, 1913, page 247.

No Change in Cleveland Wage Question.—A committee from the local branch of the Amalgamated Association of Street and Electric Railway Employees on July 22 again presented demands to the Cleveland Railway Company for a readjustment of the schedules, improvement in working conditions and a minimum workday of eight hours. J. J. Stanley, president of the railway, again informed the committee that an increase in wages of 1 cent an hour for the men who have been with the company one year or over and a minimum day of five hours is the best the company can do. This will cause an increase in expenses of $150,000 per year, all that can be allowed at this time. G. R. Davies, president of the local branch of the union, recently announced that the schedule used in 1906 and an eight-hour minimum day would be demanded.

Boston Elevated to Build Bridge for Malden Extension.—Lieutenant-Colonel Craighill of the United States Engineers gave a hearing at Boston, Mass., recently upon the plans of the Boston Elevated Railway for the construction of a new bridge over the Mystic River, between Boston and Everett, in connection with the building of an elevated line between Sullivan Square and Malden. The plans have been approved by the Boston Port Directors and by the Public Service Commission, sitting jointly. The work will include the construction of a new bridge for the exclusive use of the company's cars and the relocation of the draw of the present bridge. Both draws will be 75 ft. wide and will be operated from one tower. There was no opposition, and Lieutenant-Colonel Craighill announced that a favorable report on the matter will be sent to the War Department at Washington for final approval. With the construction of the bridge and its connecting elevated line, the rapid transit system will extend from Forest Hills to Everett, a distance of nearly 10 miles.

Appreciation Shown by Newspapers.—The manner in which traffic on July 4 was handled by the Hudson Valley Railway, Glens Falls, N. Y., resulted in much favorable comment on the part of the newspapers. The Glens Falls *Times* remarked: "Never in the history of local street railroad business has a large crowd been handled so satisfactorily. The general manager and his subordinates all come in for unstinted praise—that is, from intelligent, fair-minded, reasonable people, who realize just what is involved in handling abnormal business of any kind with limited facilities." The *Post-Star* wrote editorially as follows: "Ample testimony of the efficiency of the Hudson Valley Railway is found in the success with which the road handled the July 4 crowds. The employees are to be commended for the part they played in making this possible. Glens Falls and her sister communities have a right to be proud of the Hudson Valley Railway. It is contributing every day in the year to the convenience and the pleasure of the people of this section. Under the wise supervision of A. E. Reynolds, the usefulness of the line is steadily increasing, and it will score still greater success in the future."

Meeting of Southeastern Section of N. E. L. A.—Announcement has been made that the Southeastern Section of the National Electric Light Association will hold its next convention at the Isle of Palms, S. C., on August 19, 20 and 21. This section of the National Association has met with rapid progress under the direction of its president, T. W. Peters, of the Columbus (Ga.) Railroad. In this work Mr. Peters has been assisted by a number of electric railway men, including A. A. Wilbur, assistant secretary and assistant treasurer Columbus (Ga.) Railroad; C. D. Flanigan, second vice-president and chief engineer Athens (Ga.) Railway & Electric Company, and W. L. Southwell, of the Macon (Ga.) Railway & Light Company. T. M. Bender, assistant secretary and treasurer of the Charleston (S. C.) Consolidated Railway & Light Company, is chairman of the committee of entertainment. Other members of this committee are R. L. Lindsay, general manager Durham (N. C.) Traction Company; E. C. Deal, vice-president and general manager Augusta, Aiken Railway & Electric Corporation, Augusta, Ga.; J. E. Bigham, assistant treasurer Tampa (Fla.) Electric Company, and W. W. Fuller, general superintendent Charleston-Isle of Palms Traction Company, Charleston, S. C. All the attractions at the Isle of Palms, which are owned by the Charleston-Isle of Palms Traction Company, will be placed at the disposal of the delegates.

Financial and Corporate

Stock and Money Markets

July 23, 1914.

While there were declines to-day at the opening in most of the stocks on the New York Stock Exchange, the initial losses were generally small and were reduced on the next few transactions. There was little indication of a reactional tendency and the leading issues showed an ability to recover whenever pressure was removed. The threatened suit against the New Haven resulted in an over-night loss of two points for that road, but there was a fractional recovery in a short time. Rates in the money market were: Call, 2 per cent; sixty days, 2¼ per cent; ninety days, 2½ @ 3¼ per cent; four months, 3½ per cent; five months, 3¾ per cent; six months, 4 per cent.

A steady tone was manifested on the Philadelphia Stock Exchange to-day, but to the end conditions were dull.

The stock market in Chicago to-day was characterized by irregularity. Bonds, however, were steady.

With the exception of the New Haven and Boston & Maine securities, the tone on the Boston Exchange was firm.

In Baltimore trading on the Stock Exchange was generally dull. The sale of stocks totaled 806 shares and of bonds $23,100, par value.

ANNUAL REPORTS

Philadelphia Rapid Transit Company

The comparative statement of income, profit and loss of the Philadelphia (Pa.) Rapid Transit Company for the years ended June 30, 1913 and 1914, follows:

	1914	1913
Earnings:		
Gross passenger earnings	$23,356,877	$23,020,932
Receipts from other sources	898,936	906,247
Total	$24,255,813	$23,927,179
Expenses:		
Maintenance and renewals:		
Maintenance	$2,668,752	$2,495,513
Reserve fund for renewals	969,620	1,093,564
Total	$3,638,372	$3,589,077
Operation of power plants	1,557,965	1,454,122
Operation of cars	6,297,115	6,129,119
General	1,527,388	1,807,949
Taxes	1,278,406	1,225,488
Total expenses	$14,299,246	$14,205,755
Net earnings from operation	$9,956,567	$9,721,424
Fixed charges:		
Interest	$2,161,696	$1,728,223
Rentals	7,364,634	7,363,618
Sinking fund, city contract	120,000	120,000
Total	$9,646,331	$9,211,841
Surplus	$310,236	$509,583

The increase in gross earnings of the company for the past three years, which averages 4.05 per cent, approximates the normal increase of the system for the last ten years. In the opinion of the company this is the rate that will obtain in the future under normal conditions. The increase in gross earnings for the last year, ended June 30, 1914, was about $328,634 or 1.37 per cent, made up of a 1.46 per cent increase in gross passenger earnings and an 0.81 per cent decrease in receipts from other sources. The total operating expenses increased 0.65 per cent, the net earnings from operation 2.4 per cent, and the fixed charges 4.7 per cent. The resulting surplus was $310,236, as compared to $509,583 for the preceding year, but the surplus earned to June 30, 1914, is more than $800,000 in advance of that estimated for this period at the incoming of the Stotesbury management.

The proportions of earnings devoted to expenses and fixed charges were as follows: Maintenance, 11 per cent; renewals, 4 per cent; operation of power plants, 6.42 per cent; operation of cars, 25.96 per cent; general, 6.3 per cent; taxes, 5.27 per cent; interest, 8.92 per cent; rentals, 30.36 per cent, and sinking fund, 0.49 per cent. The principal items of capital expenditure during the three and one-half years ended June 30, 1914, were as follows: 1500 near-side cars and eighty elevated cars, $5,966,000; two concrete carhouses with capacity for 669 near-side cars and improvements to other carhouses $1,568,000; additional generating machinery, etc., $1,992,000; track additions, betterments and real estate, $1,774,000, and refunding of capital obligations and discounts, $2,068,000.

During the year $969,620 was appropriated to the renewal fund from income, this being the unexpended balance of 15 per cent of gross earnings charged to operation for maintenance and renewals. The policy of the company provides for paying 50 per cent of the total cost of the new near-side cars out of earnings through the medium of renewal reserve, 20 per cent for cash payments and 30 per cent for the retirement of car trust certificates. The car trust certificates retired and the cash payments made during the year amounted to $1,091,561. Besides this amount there was paid from the renewal fund $1,008,041 for renewals and replacements of cars, track, power plant equipment and buildings. The unexpended balance of the reserve for renewals as of June 30, 1914, amounted to $1,042,962. Against this there was held in the treasury for account of renewal fund $1,043,000 par value of the company's 5 per cent bonds of the $10,000,000 issue of 1912.

As of June 21, 1914, fire insurance policies were taken out for a term of three years providing protection to the extent of $23,000,000 at an annual rate of 25 cents per $100, representing an annual premium of $57,500. There has been an aggregate reduction of 25 cents per $100 in the rate of premium during the last three years. The report outlines briefly the changes that have taken place under the Stotesbury management since June 5, 1911, full details of which were published in the ELECTRIC RAILWAY JOURNAL of July 18, page 122. The maximum wage of motormen and conductors during the past two years has been increased from 23 cents to 30 cents per hour, and more than 47 per cent of the men are receiving the maximum wage.

The building up of the property is thought to be well toward accomplishment, but the producing of a return upon the $30,000,000 of capital stock actually paid in is temporarily subordinated to the rehabilitation of the property because of the payment of interest upon more than $14,000,000 of new capital investment. The report states, however, that the surplus earnings of the property as now rehabilitated should rapidly accumulate to the interest of the stockholders, excepting only as the earning power of the company and its ability to secure new capital may be affected by the plans of the city for rapid transit development.

In conclusion the report touches briefly on the proposed subway and elevated lines to be built by the city and operated by the company. It is stated that the suggested agreement has been submitted to the Philadelphia Rapid Transit Company and the Union Traction Company, but that neither these companies nor the city has yet taken any action.

Third Avenue Railway

According to the preliminary report of the Third Avenue Railway, New York, for the twelve months ended June 30, the earnings for the period were as follows:

	1914	1913
Gross income	$10,858,455	$10,117,847
Net after taxes	3,131,978	3,042,015
Other income	79,103	70,170
Total income	3,211,081	3,112,185
*Charges	2,569,842	2,195,227
Net income	†641,239	916,958

*Includes interest on adjustment mortgage bonds.

†Equal to 3.86 per cent earned on $16,590,000 of common stock compared with 5.25 per cent earned on same stock for previous year.

In earning 3.8 per cent upon the $16,590,000 of stock, as noted in the statement above, the company added $641,239 to surplus account, as compared to $916,958 the year previous. In 1913-1914, however, the full 5 per cent was paid on the $22,536,000 of adjustment income bonds, whereas in the year ended June 30, 1913, only 3¾ per cent was paid—1¼ per cent for the first six months and the full 2½ per cent in the second half of the year. If the full amount had been paid for the entire year, the final surplus would have been about equal to the surplus shown this year.

The increase in gross earnings for 1913-1914 was $740,607, or 7.3 per cent over the year previous. Increased expenses took up all but $100,000 of the gross revenue gain, a large part of the heavier outlay being caused by storm damage and heavy paving bills. On this point F. W. Whitridge, president of the company, has issued the following statement:

"The increased expenses can be explained by the unprecedentedly unpropitious weather during practically the whole of the six months and by the very large expenditures for paving, in part caused by the storms. The obligations of the street railways in respect to paving have become, with the entire change of the character and volume of the city traffic trespassing upon the rails, very onerous, and the burden is increased by the manner of the city's administration of the streets. Every pound of coal burned on upper Amsterdam Avenue goes up on the Third Avenue tracks. After and during the snow storm last winter the omnibuses of the Fifth Avenue Company occupied portions of our tracks for thirty days without permit, apology or payment. Some months ago in one single case seventy-nine ton girders were hauled over our tracks in Forty-second Street, smashing over $1,000 worth of manholes and rails. This is all unnecessary and against the interests of the traveling public."

Continuing, Mr. Whitridge states that the company has recently purchased the City Island line for $40,000, which can be completed so as to serve that section to the satisfaction of the citizens at an additional outlay of about $25,000. The board of directors has recently authorized the construction of a printing plant for the printing of transfers, which will save not less than $25,000 a year.

The complete annual report will be prepared after an audit in time for the annual meeting in the autumn.

Augusta-Aiken Railway & Electric Corporation

The annual report of the Augusta-Aiken Railway & Electric Corporation of South Carolina for the calendar year 1913 shows the following income profit and loss items: Gross earnings from all sources, $725,073; operating expenses, including taxes, $403,084; net earnings from operation, $321,989; prior deductions for interest and sinking fund, $55,000; current interest on bonds and floating debt, $150,170; gross surplus, $116,819; dividends, $90,000; net surplus, $26,819.

As compared with 1912, the gross earnings showed an increase of $62,482, or 9.4 per cent; the operating expenses and taxes increased $33,646, or 9.1 per cent; the net earnings increased $28,836, or 9.8 per cent, while the surplus was greater by $16,877, or 16.9 per cent. The gross electric earnings increased $46,299, or 18.9 per cent, with an increase in expenses of $22,051, or 23.4 per cent. The gross railroad earnings increased $18,862, or 5.4 per cent, while the expenses increased $8,192, or 4.2 per cent. The gross earnings from other departments decreased $2,679, or 4 per cent, and the expenses increased $2,157, or 5.9 per cent. The report states that expenses were higher in 1913 owing to an increase in the wages of employees in the transportation department, the conducting of an active new business campaign in the lighting department and the generation of a much larger output of current to take care of new customers, necessitating the use of the steam plant for a greater part of the time, the available water supply from the city canal having been used to capacity.

In addition to the usual maintenance expenses, $94,321 was expended for construction work. More than half of this was for connecting and serving new customers in the electric department; $11,873 for an addition to the switchboard to control the apparatus of both city plants, and more than $10,000 for track work, new waiting stations on the interurban line and shop tools for the railway department.

Further Details of Columbus Refunding Plan

Stockholders of the Columbus Railway, Power & Light Company, Columbus, Ohio, will hold an adjourned meeting on July 29 to complete the proposed financing plans of the company, referred to in the ELECTRIC RAILWAY JOURNAL of June 6 and July 4. At this meeting the stockholders will vote on the capital stock increase from $11,550,000 to $15,145,000, which is to include an issue of $3,145,000, to be exchanged for the first consolidated mortgage 4 per cent bonds of the Columbus Railway Company, and an issue of $450,000 of 6 per cent Series "A" preferred stock, to be exchanged for the 6 per cent mortgage bonds of the Columbus Electric Company.

In addition to these securities the company proposes to issue approximately $5,000,000 of bonds to exchange for the outstanding bonds of the old companies. It is probable that at the same time the company will ask permission to issue $400,000 to $500,000 of bonds for financing extensions and improvements to properties. These will be a part of the $25,000,000 bonds authorized by resolution of the stockholders on June 29, as noted in the ELECTRIC RAILWAY JOURNAL of July 4.

American Water Works & Electric Company, Pittsburgh, Pa.—In a circular issued to stockholders of the American Water Works & Electric Company, H. Hobart Porter, president, says that earnings accruing from the water properties, together with interest on cash and securities in the treasury, will be more than sufficient to cover bond interest and first preferred dividends, even without income from the West Penn Traction & Water Power stocks owned by the company. It has been decided to close the fiscal year June 30, and quarterly dividends of 1¾ per cent on the first preferred stock will be paid every three months, beginning with Oct. 1. The dividend due Oct. 1, 1914, will be for the period from April 27, 1914, the date on which the present company took over the assets of the American Water Works & Guarantee Company.

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—Subject to the usual advertised legal notice of thirty days, the resale of the Chicago & Milwaukee Electric Railroad is soon to be announced. It is expected that the reorganization committee will bid in the property and proceed immediately with a plan providing for exchange of the securities of the two existing companies for those in a new company. This company is to have $6,000,000 of capital stock, first mortgage bonds not to exceed $10,000,000, second mortgage non-cumulative 4 per cent income bonds not to exceed $4,500,000, and third mortgage non-cumulative 4 per cent income bonds not to exceed $6,000,000. For the $4,000,000 of Illinois company 5's outstanding there shall be given 100 per cent in second mortgage bonds; and for the $10,000,000 of Wisconsin 5's now outstanding, 50 per cent in third mortgage bonds. For the $5,000,000 of stock of the old company, 50 per cent in stock is to be offered. An amount not exceeding $4,500,000 of first mortgage bonds is to be used for receivers' obligations and the payment of underlying bonds of $1,080,000 on the Illinois division. The balance will be used for corporate purposes.

Columbus, Marion & Bucyrus Railway, Marion, Ohio.—James H. Caldwell, chairman of the bondholders committee which bought the Columbus, Marion & Bucyrus Railway at foreclosure sale in May, 1913, has turned over the property to a new company, of which George H. Whysall is president and general manager.

Hudson & Manhattan Railroad, New York, N. Y.—The Public Utility Commission of New Jersey recently approved the application of the Hudson & Manhattan Railroad to issue $154,000 of first refunding mortgage 5's of 1913. This amount makes a total of $36,716,633 outstanding.

London & Lake Erie Railway & Transportation Company, London, Ont.—A special general meeting of the London & Lake Erie Railway & Transportation Company has been called for Aug. 18 for the purpose of authorizing a bond issue of $30,000. The proceeds are to be used for retiring existing bonds and for other purposes of the railway.

Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company, Minneapolis, Minn.—The Chicago-Great Western Railroad has leased for fifty years to the Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company the portion of its line extending from Mankato, Minn., to Randolph, Minn., a distance of 57 miles.

The Newell Street Railway, East Liverpool, Ohio.—The Public Utilities Commission of Ohio has authorized The Newell Street Railway, an Ohio corporation, to increase from $17,510 to $35,000 the amount upon which interest is to be paid under the lease made between it and the Newell Street Railway, a West Virginia corporation, under the terms of which the latter company operates over the tracks of The Newell Street Railway in East Liverpool, Ohio. The authorization of this lease were noted by the ELECTRIC RAILWAY JOURNAL of Nov. 8, 1913.

North American Company, New York, N. Y.—Festus J. Wade, St. Louis, Mo., has been elected a director of the North American Company to succeed the late James Campbell. No action has been taken on the election of a successor to Mr. Campbell as chairman of the board of directors.

Ohio Traction Company, Cincinnati, Ohio.—Judge Sater in the United States District Court at Columbus on July 9 held invalid the ordinance recently passed by the Cincinnati City Council providing for a 5-cent fare from Cincinnati to Carthage and Hartwell, instead of the present 10-cent rate. An injunction is granted against the enforcement of the ordinance. The court states that all franchises under which the Mill Creek Valley line is being operated between Fifth and Walnut Streets and the north corporation line of Cincinnati are valid and have not yet expired and that the enforcement of the ordinance would impair the property rights of the Ohio Traction Company. Judge Sater's opinion decided every question raised in the case in favor of the traction company. He states that there is no reason why franchises granted to street railways should not be perpetual any more than in the case of steam railroads.

Pacific Gas & Electric Company, San Francisco, Cal.—According to a preliminary tabulation, subscriptions have been received from 1330 employees of the Pacific Gas & Electric Company for $453,400 of the new first preferred stock. It was expected that $500,000 would be subscribed by them. The subscribing employees constitute nearly 40 per cent of the staff of the company, this percentage, according to the belief of the company, being greater than in any other public service corporation. The plan of financing and reclassification of stock of this company was described in the ELECTRIC RAILWAY JOURNAL of June 13.

Piedmont & Northern Railway, Charlotte, S. C.—The Greenville, Spartanburg & Anderson Railway, Greenville, S. C., and the Piedmont Traction Company, Charlotte, N. C., have been consolidated under the title of the Piedmont & Northern Railway. The new corporation has filed a mortgage to secure an authorized issue of $50,000,000 of forty-year first 5 per cent bonds with the Farmers' Loan & Trust Company, New York, as trustee. As a result of the merger, C. V. Palmer, general freight and passenger agent, will be moved to Greenville, S. C., and C. S. Allen, Jr., will be traffic agent with headquarters in the same city. T. L. Black will remain in Charlotte, S. C., as auditor, all the other officers of the system reporting to this city as the head office.

Southern Pacific Company, San Francisco, Cal.—The New York Stock Exchange has authorized the listing of $54,534,000 of 5 per cent twenty-year convertible bonds of the Southern Pacific Company, due 1934 on notice of issuance in exchange for subscription receipts outstanding.

Stockton Terminal & Eastern Railroad, Stockton, Cal.—The Stockton Terminal & Eastern Railroad recently filed an application with the California Railroad Commission asking for authority to issue a note for the sum of $1,000 to renew a note of like amount of the San Joaquin Valley Bank of Stockton. This note is to be secured by bonds of the company to the par value of $2,000.

The Hagerstown & Frederick Railway, Frederick, Md.—Nelson Cook & Company, Baltimore, Md., are offering for sale at 98½ and interest, to net 6.1 per cent, refunding 6 per cent thirty-year sinking gold bonds of the Hagerstown & Frederick Railway. These bonds are dated April 1, 1914, and are in denominations of $100, $500 and $1,000. They are an absolute first mortgage on the properties of the Frederick & Hagerstown Power Company and the Frederick Railroad, and a mortgage upon all other properties of the company subject to only $1,050,000 of prior lien bonds on constituent companies, against which a like amount of Hagerstown & Frederick Railway first and refunding 6's have been reserved. The property consists of a series of street railways in Hagerstown, Md., street railways in Frederick, Md., an interurban railway extending from Frederick to Hagerstown with extensions to Thermont, Md., and Shady Grove, Pa., with branch lines to Bloomsboro, Md., and Jefferson, Md.

Third Avenue Railway, New York, N. Y.—The Third Avenue Railway has declared a semi-annual interest payment of 2½ per cent on its $22,536,000 of adjustment income bonds for the first six months of 1914. This, with the 2½ per cent paid on April 1, 1914, makes a payment of 5 per cent on the earnings for the fiscal year ended June 30, 1914. The interest payment for the year previous totalled 3¾ per cent.

Toronto (Ont.) Railway.—The traffic receipts of the Toronto Railway for the six months ended June 30 were $3,035,301, as compared to $2,893,843 for the same period in 1913, or an increase of 4.89 per cent. If this rate of increase is maintained for the whole year, the 1914 earnings will approximate $6,344,816. The report submitted by Messrs. Arnold and Moyes in connection with the proposed purchase deal estimated this year's revenue at $6,592,140.

Union Consolidated Elevated Railway, Chicago, Ill.—In the Circuit Court on July 7 Judge Windes held that State Attorney Hoyne should be prevented from proceeding against the Union Consolidated Elevated Railway on the ground of overcapitalization. The court said that if there was any basis for the suit it should have been brought years ago and that by inaction the people had ratified the company's acts.

United Power & Transportation Company, Camden, N. J.—A semi-annual dividend of $1.40 per $25 share has been declared on the $3,592,750 of stock of the United Power & Transportation Company, payable to the holders of record July 16. This payment compares with $1.52 paid on Jan. 1.

United Railways & Electric Company, Baltimore, Md.—Nelson Cook & Company, Baltimore, Md., are offering for sale at 99⅞ and interest, to yield 5.1 per cent, collateral trust 5 per cent convertible gold bonds of the United Railways & Electric Company, dated June 1, 1914, and due June 1, 1916. These notes are convertible into stock at $50 per share and are secured by deposit with the trustee of $1,333,000 of first consolidated mortgage 4's.

Warren, Brookfield & Spencer Street Railway, Brookfield, Mass.—The foreclosure sale of the Warren, Brookfield & Spencer Street Railway, which was originally set for June 4 and postponed until June 16, has been further put over until Aug. 6.

Dividends Declared

American Railways, Philadelphia, Pa., quarterly, 1¾ per cent, preferred.

Bangor (Maine) Railway & Electric Company, quarterly (No. 2), 1½ per cent, common.

Brazilian Traction, Light & Power Company, Toronto, Can., quarterly, 1½ per cent, common.

Columbus Railway, Power & Light Company, Columbus, Ohio, quarterly (No. 2), 1¼ per cent, common; quarterly (No. 2), 1¼ per cent, preferred, Series B.

Cumberland County Power & Light Company, Portland, Me., quarterly, 1½ per cent, preferred.

East St. Louis & Suburban Company, East St. Louis, Ill., quarterly, 1¼ per cent, preferred.

Railways Company General, New York, N. Y., quarterly, 1 per cent.

United Power & Transportation Company, Camden, N. J., $1.40.

Traffic and Transportation

Service Hearings Ended in Albany

Hearings before the Public Service Commission for the Second District of New York on the complaints against the service of the United Traction Company, Albany, N. Y., were closed on July 21 with the submission of expert testimony for the company. Previous hearings were described in the ELECTRIC RAILWAY JOURNAL of July 18. Charles Remelius, the well-known mechanical expert, and W. E. Rockwell, manager Eastern Pennsylvania Railways, Pottsville, Pa., declared that the service of the United Traction Company, both as to equipment and number of seats run, was one of the best they had ever seen.

Both experts warmly defended the use of single-truck cars. Mr. Remelius stated that he had designed and supervised the erection of the double-truck cars now in use on the Pine Hills line, but he was of the opinion that single-truck cars were capable of better service in a city such as Albany. The single-truck cars now in use there he pronounced to be in a "fair average physical condition." The braking system he called "perfectly safe" and he considered that the addition of any auxiliary system would be inadvisable.

Speaking of the experience of other cities in the use of single-truck cars, Mr. Remelius declared that the manufacturing company with which he was connected last year had built no less than seventy cars of that type, twenty of which were sold to the railway in Covington, Ky., and fifty to Detroit, where they are now in satisfactory use. "The Third Avenue line in New York City," continued Mr. Remelius, "uses many single-truck cars with good effect, and on Staten Island they are used exclusively. There are some in Syracuse, Binghamton, Utica and in many cities in the West. Fifty per cent of the cars in Cincinnati are of the single-truck type."

Mr. Remelius pronounced all of the track of the company to be in excellent condition, with the exception of small stretches in South Pearl Street and South Broadway, which he understood would be improved as soon as adjacent paving projects were got under way by the city. He stated that the United Traction Company furnishes more seats per passenger than any other road within his experience, and the passenger counts show that the service is much better than that afforded in most cities.

Mr. Rockwell's testimony brought out the fact that all the single-truck cars in Albany are equipped with a double-braking system, a very usual completeness of equipment. He declared that no addition to the braking system was at the present time advisable. The 18-ft., 20-ft. and 21-ft. cars operated by the United Traction Company are the standard of single-truck equipment throughout the country, and if Mr. Rockwell were operating the United Traction Company he would put in single-truck cars on all the city lines.

Mr. Rockwell said that the snow-fighting equipment of the company was equal to that of any other road in its latitude, and better than that of any road in the State except that of the Syracuse, Lake Shore & Northern Railroad, through the snowy territory north of Syracuse. In regard to service, he said that he had made a personal inspection during the rush hours and that at no time did he see more than five passengers standing in a car.

C. R. Barnes, electrical engineer of the commission, whose recommendations regarding service were published in the ELECTRIC RAILWAY JOURNAL of June 27, page 1478, testified that he was not objecting to the average of seats furnished by the company during the rush hours. He insisted, however, that there were certain periods during the rush hours when more seats should be furnished.

J. H. Uffert, master mechanic of the company, stated that with the reconstruction proposed for the 400 type cars now in use these cars would compare favorably for comfort, convenience and service with the most modern of the Pine Hill cars. The reconstructed cars should last another ten years and would not need to be renewed during that time. Asked what changes the company contemplated for the coming winter, Mr. Uffert said that all the cars would be put through the shops and the front entrances changed. The new power line would also be available and the erection of the new transformer station would be rushed.

Safety Work in Seattle

George Carson, general claim agent of the Puget Sound Traction, Light & Power Company, recently compiled an interesting history of the development of safety work in connection with this company. According to Mr. Carson, the first safety work was undertaken by Stone & Webster in 1908 when the firm began a campaign of publicity in the daily press of all cities where their properties were located, publishing cuts illustrating various types of accidents. Soon after this officials of the Puget Sound Traction, Light & Power Company and the trainmen began to hold occasional meetings, but it was not until June 21, 1910, that an active organization was formed. At a meeting held on this date, J. H. Wilmot, then chief clerk of the claim department, submitted figures showing that 10 per cent of the gross railway receipts was being spent for accidents. For the month of May, 1910, there were 450 reported accidents. The cost of this number of accidents, together with the expenses of operation for the claim department, brought the total expense for the month up to $26,620. Owing to activity in safety work, however, the present average expense of the claim department and the cost of accidents have been cut to one-half that amount.

In the autumn of 1910 lectures were begun in public and private schools, clubs and universities. The result of this was as follows: Between July 1, 1909, and July 1, 1910, there were 157 accidents in which boys and girls were involved, about thirteen a month. Between Sept. 1, 1910, and May 1, 1911, there were thirty-three accidents to boys and girls. In other words, the accidents of that character averaged during the school year of 1910, when the lectures were begun, and the spring of 1911 approximately four a month, or nine less a month than occurred during the previous period.

Early in 1911 a circular letter was sent to all vehicle owners throughout the city, asking their co-operation, cards illustrating accidents were placed in all barns and garages, and 100,000 desk blotters were distributed in offices and mailed with bills to the company's customers. Large safety pennants were placed in shops and other buildings. In January, 1912, safety committees were organized, and following closely on this the carhouse bogie system was adopted. In the summer of 1912 the transportation department adopted the near-side stop. By the autumn of 1912 all the cars of the company except cable cars were equipped with folding or sliding gates at both ends. Recently the company decided to complete this work by installing the same devices on the cable cars. In August, 1912, a subcommittee of the central safety committee was appointed to take up the matter of carhouse meetings.

In the spring of 1913 a follow-up circular was sent to vehicle owners, and other more elaborate posters illustrating accidents were placed on the premises of vehicle owners throughout the city. The safety committee was reorganized in September, 1913, three divisions of the light and power department being added. In the winter of 1913 stereopticon views were introduced in connection with the carhouse conferences.

The latest move has been the printing and distribution among school children of 50,000 safety guide pamphlets with proper words of warning against accidents. Mr. Carson concludes that with continued co-operation on the part of employees of all departments the outlook for the future in Seattle is highly encouraging, in view of the success of these past endeavors.

Single Fare Petition Dismissed in Massachusetts.—The Public Service Commission of Massachusetts on July 17 dismissed the petition of the selectmen of Watertown relative to the establishment of a single fare on the Boston Elevated Railway and the Middlesex & Boston Street Railway between points in Watertown and Boston.

Accident on Virginia Interurban Line.—Six persons were killed and twenty-two injured as a result of a collision on July 17 between an electric interurban train of the Virginia Railway & Power Company and a coal train of the Virginia Railroad at Fairmont, eight miles from Norfolk. The accident occurred at a grade crossing of the railroad. Two of the three electric cars in the interurban train were completely wrecked.

New Rate Schedule Held Up in Seattle.—Assistant Corporation Counsel R. S. Pierce has been advised by the Public Service Commission that the new schedule of rates will not be put into effect by the Seattle, Renton & Southern Railway, Seattle, Wash., until the city has had opportunity to argue its objection to the proposed 10-cent fare to the south city limits at Ryan Street. The new rates were to have gone into effect on July 10.

Freight Service in Seattle.—The opening of freight service on the Highland Park & Lake Burien line of the Seattle Municipal Railway, known as Division "C," was forecast recently by the introduction of ordinances in the city council appropriating money to build a carhouse and to purchase or construct freight equipment. The proposed legislation is in the hands of the finance and public utilities committee of the City Council, where all the details will be worked out.

Bonus to Employees of Capital Traction Company.—The Capital Traction Company, Washington, D. C., on July 9 distributed to its conductors and motormen $21,680 in bonuses for faithful service during the last year. Employees who had been in the service ten years received $100 each; five years, $75; two years, $50, and one year, $25. The awards were in all cases passed upon by a board consisting of the president, general manager and the division superintendents.

Limited Speed Near Schools and Churches.—As a means of lessening the danger of children being run down by street cars, the City Council of Aurora, Ill., has proposed an ordinance prohibiting the running of cars faster than five miles an hour within a zone extending 250 ft. in every direction from all schools and churches. The ordinance was prepared by City Attorney J. Bruce Amell. The ordinance also provides that posts be erected at the edge of each "speed zone" as warning signs. The new regulation also includes automobiles and other vehicles.

Increase of Municipal Fares in Saskatoon.—The City Council of Saskatoon, Sask., recently passed a resolution increasing the fares of the municipally owned electric railway to a straight 5-cent fare. As heretofore, workmen's tickets are sold eight for 25 cents, for use between 6 a. m. and 8 a. m., and school children are carried at half fare to and from school. The six-for-25-cents tickets outstanding will be honored. The reason for the change was the deficit of $14,000 in operating the cars, which the commissioners expect will be wiped out by the increased receipts.

Stools for Motormen on Platform.—According to a recent order promulgated by the Quincy (Ill.) Railway, the motormen are to be allowed to sit down on stools furnished by themselves. Stools must be uniform in design, material and appearance and must be kept in the lockers in the employees' headquarters. The instructions provide that the motormen must stand up as cars approach and pass over electric railway or steam railroad crossings, or while the cars are passing through business districts or congested sections of the city, under penalty of a revocation of the privilege. The new order went into effect on July 15.

Switching Facilities between Electric and Steam Lines.—The Illinois Public Utilities Commission has filed an order in the case of the Illinois Traction System vs. the Illinois Central Railroad directing the latter company to furnish switching facilities in full to the electric railway. The Illinois Central Railroad asserted that inasmuch as it exchanged no business with the Illinois Traction System or other electric lines in the State, it should not be compelled to furnish switching facilities. The order of the commission, however, recognizes at least the possibility of traffic exchange between the electric and steam transportation systems.

Passing of the Cable Car in Providence.—Superintendent of Transportation R. R. Anderson of the Union Railroad, Providence, R. I., has announced that the last remnant of the old Providence (R. I.) Cable Tramway will disappear between Aug. 1 and Aug. 15, when the College Hill tunnel is opened for traffic. This is one of the last of the counterweight systems in use in this country. Together with the grip car the company will dispose of most of the 149 short trailers now in service. A few, however, will be reserved with the consent of the city for use during rush hours. The counterweight system was originally installed by Milton H. Bronsden, who also installed one at Duluth and one at St. Paul, both of which have been discontinued.

Workmen's Tickets Ordered on Berkshire Street Railway.—The Massachusetts Public Service Commission has ordered the Berkshire Street Railway to place on sale workmen's tickets between Berkshire Village and Pittsfield at the rate of seven tickets for 50 cents. The board found that while the financial condition of the company does not warrant an order reducing the present revenue, this fact does not warrant discrimination in the rates charged. It appeared from the evidence that the present fare from North Adams to Sand Springs in Williamstown and to Williamstown Village, a distance of about 6 miles in each case, and between North Adams and the Brown paper plant in Adams, about 6 miles, is 5 cents. The length of these rides corresponds closely to the distance between Berkshire Village and Pittsfield. The board stipulates that the tickets ordered on sale shall be valid only between the hours of 5 and 7, both a. m. and p. m.

Sunday Service Increased in Brooklyn.—Changes in the Sunday and holiday schedules of the elevated lines of the Brooklyn Rapid Transit Company involving an increase of about 15 per cent in the service are being tried out by that company. This is the result of an agreement reached between Joseph Johnson, chief of the transit bureau of the Public Service Commission for the First District of New York, and John J. Dempsey, superintendent of the Brooklyn Rapid Transit Company elevated lines. The chief changes are the running of the Brighton Beach expresses in the afternoon on a six-minute headway, Franklin Avenue expresses on a 7½-minute headway, and the West End line expresses on a six-minute headway in the afternoon and between 7 p. m. and 9 p. m. Slight changes were also made on the Culver, Myrtle Avenue, Lexington Avenue and Fulton Street lines. A hearing before the commission set for July 16 was postponed for two weeks pending a trial of the increased service.

Application to Eliminate Reduced Round-Trip Fares.—The Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., has made application to the Public Service Commission of Indiana for authority to eliminate the reduction on the sale of round-trip tickets over its lines. The petition shows that in Indiana it is unlawful for any public utility to demand, collect or receive a greater compensation for any service than the charge fixed by statute on the lowest schedule of rates for the same service on Jan. 1, 1913. It is stated that the rates provided by the present tariff are not sufficiently remunerative to enable the petitioner to furnish a good and adequate service to its patrons, maintain its property, provide for a reasonable depreciation charge and pay a fair return on the investment. The petition also states that the steam railroad in direct competition with the petitioner does not make any reduction on round-trip tickets sold over its line, and that not many interurban lines in the State make such a reduction. No date has yet been fixed by the Public Service Commission for a hearing.

Investigation of Coney Island Traffic Interruption.—An investigation that has been made of the traffic interruption on July 7 on the Coney Island lines of the Brooklyn Rapid Transit Company, noted in the ELECTRIC RAILWAY JOURNAL of July 18, discloses the fact that the interruption was caused by the failure of high-tension cables supplying the Coney Island and Parkville substations. In his report to the Public Service Commission, Clifton W. Wilder, electrical engineer, states that the exact cause of this burn-out is beyond determination. During the reconstruction of the burned-out machine in the Coney Island substation, the company has placed the Kings Highway substation of the Coney Island & Brooklyn Railroad in operation, and will keep it in condition for immediate service in case of need. The plans for the reconstruction of the existing railroads under the dual transit plan provide for a second set of feeders from the main power station to the Parkville and the New Utrecht substations. These feeders are to be installed in the new Fourth Avenue subway, thereby giving two entirely independent feeder lines for all substations in this vicinity.

Personal Mention

Mr. Edward Wright has been appointed to succeed Mr. G. W. Chynoweth as master mechanic of the Fort Smith Light & Traction Company, Fort Smith, Ark.

Mr. H. B. Smith has been appointed master mechanic of the Grand Junction & Grand River Valley Railway, Grand Junction, Col., to succeed Mr. J. N. Hinds.

Mr. C. Stackhouse has been appointed chief engineer and electrician of the California Street Cable Railroad, San Francisco, Cal., to succeed Mr. A. D. McLean.

Mr. A. R. Hughes has been appointed assistant treasurer of the Republic Railway & Light Company, Youngstown, Ohio, to succeed Mr. W. H. Shubert, resigned.

Mr. W. H. Carnahan, who has been assistant treasurer of the Quincy (Ill.) Railway, has been elected treasurer of the company, to succeed Mr. Edward Woodman.

Mr. C. L. Humphries has been appointed trainmaster of the San Francisco, Napa & Calistoga Railway, Napa, Cal., to succeed Mr. W. J. Davis, acting trainmaster.

Mr. G. Y. Gaillard, who has been general passenger and express agent of the Connecticut Company, New Haven, Conn., has had his title changed to traffic agent.

Mr. O. C. Manly has been appointed general freight and passenger agent of the Ohio & Southern Traction Company, Columbus, Ohio, to succeed Mr. H. H. Falkenbach.

Mr. Ralph R. Wright has been elected secretary and treasurer of the Grand Junction & Grand River Valley Railway, Grand Junction, Col., to succeed Mr. Orson Adams.

Mr. W. H. Edmunds, who has been general foreman of the Denver & Interurban Railroad, Denver, Col., has had his title changed to electrical engineer and trainmaster.

Mr. John Stacy has been appointed roadmaster of the St. Lawrence International Electric Railroad & Land Company, Alexandria Bay, N. Y., to succeed Mr. F. Youngs.

Mr. W. B. Gregory has been appointed engineer of the power station of the Connecticut Company at Berlin, Conn., on the Middletown branch to succeed Mr. S. Sargeant.

Mr. Charles H. Chapman, who has been superintendent of the lines of the Connecticut Company at Bridgeport, Conn., has had his title changed to manager of those lines.

Mr. Charles E. Davies, who has been purchasing agent of the Trenton & Mercer County Traction Corporation, Trenton, N. J., has been appointed claim agent of the company.

Mr. G. S. Brown, formerly storekeeper of the Rockford & Interurban Railway, Rockford, Ill., has been appointed assistant purchasing agent to succeed Mr. C. A. Ingle, resigned.

Mr. Charles Hoopes, who has been secretary of the Oklahoma Railway, Oklahoma City, Okla., has in addition been appointed auditor of the company to succeed Mr. W. R. Frederick.

Mr. Guy W. Fellar, who has been secretary, treasurer and superintendent of the Amarillo (Tex.) Street Railway, has been appointed second vice-president and purchasing agent of the company.

Mr. William B. McKinley, president of the Illinois Traction System, Peoria, Ill., has filed his formal petition with the Illinois Secretary of State as Republican candidate for congressman from the nineteenth Illinois congressional district.

Mr. S. B. Irelan was recently appointed vice-president and general manager of the Bartlesville (Okla.) Interurban Railway, to succeed Mr. L. G. Coleman. Mr. Irelan was formerly connected for six years with H. L. Doherty & Company in their New York office.

Mr. H. S. Gable has been appointed general freight agent of the Philadelphia & Westchester Traction Company, Upper Darby, Pa. Mr. Gable was formerly connected with the Philadelphia (Pa.) Rapid Transit Company for twelve years, serving in the transportation and receiving departments.

Mr. B. G. Campbell has been appointed assistant to A. D. Mackie, general manager of the Springfield (Ill.) Utilities Company. Mr. Campbell was recently with the Jackson

Gas Company, Jackson, Mich., and was for seven years manager of the Jackson properties of Hodenpyle, Hardy & Company.

Mr. Leonard Wheeler, who has been appointed master mechanic of the Manhattan Bridge Three Cent Line, Brooklyn, was formerly electrical engineer of the Chicago, Harvard & Geneva Lake Railroad. He was also manager of the Ruskin Park Interurban Railroad in Florida, and later foreman of construction of the electric railway of St. Petersburg, Fla.

Mr. Judson Zimmer, who has been acting master mechanic of the Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y., has been appointed master mechanic of the company. Mr. Zimmer was graduated from Union College, Schenectady, N. Y. He entered the service of the Fonda, Johnstown & Gloversville Railroad as assistant engineer, maintenance of way department, several years ago.

Mr. E. F. Stone, superintendent of the Arkansas Valley Railway, Light & Power Company, Pueblo, Col., was recently elected president of the Manufacturers' Bureau of that city, which has adopted "Home Goods for Home Folks" as its slogan. The Rocky Mountain *News* of Denver recently devoted several columns to the work of Pueblo's Manufacturers' Bureau, asserting that $50,000,000 is the annual output of Pueblo factories due to aggression of business men backed by the hard working committees of the Commerce Club. Photographs of Mr. Stone and several of Pueblo's industries illustrated the article.

Mr. W. W. Holden has been appointed superintendent of transportation of the San Antonio (Tex.) Traction Company to succeed Mr. T. C. Brown. Mr. Holden took the Westinghouse Electric & Manufacturing Company apprentice course at Pittsburgh between July, 1910, and November, 1912. He spent 1913 as electrical engineer and assistant superintendent of construction for the Southern Engineering & Construction Company, which built the Southern Traction Company out of Dallas, Tex. Prior to his recent appointment Mr. Holden spent two months in Denver and Minneapolis, and also served as a trainman with the San Antonio Traction Company for two months.

Mr. J. W. Coltman, auditor and purchasing agent of the Ashtabula Rapid Transit Company and the Pennsylvania & Ohio Railway, Ashtabula, Ohio, entered railway work in October, 1903, as depot agent of the Big Four Railroad at Shelby, Ohio. After serving for three years in that capacity he was appointed station agent of the company at North Eaton, Ohio, and four years later was made general agent of the Big Four Railway and the Lake Shore & Michigan Southern Railway at Berea, Ohio. In June, 1913, he was transferred to the East 105th Street Station, Cleveland, as assistant ticket agent of the Lake Shore & Michigan Southern Railway. He resigned from the last mentioned position to enter electric railway work.

Mr. H. L. Case, Jr., who has been appointed purchasing agent of the Trenton & Mercer County Traction Corporation, Trenton, N. J., was formerly chief clerk of the company. Mr. Case entered business at the age of thirteen with the East Trenton Machine Works, Trenton. He next became connected with the United & Globe Rubber Manufacturing Company. After serving four years and a half with the last mentioned company he entered the employ of the Geiser Manufacturing Company. A year later he accepted a position with the Pennsylvania Railroad. He served with the company for six years as stenographer in the trainmaster's office of the Belvidere Division, chief clerk to the supervisor of the same division, assistant to the captain of police and at the Pavonia Shops.

Mr. J. S. Clark, who has been appointed auditor of the Northwestern Ohio Railway & Power Company, Toledo, Ohio, entered railway work in the office of the division freight agent of the Chicago, Milwaukee & St. Paul Railway at Winona, Minn. In 1889 he accepted the position of purchasing agent with the Cleveland Stone Company, Cleveland, Ohio, with which he remained for thirteen years. He next went to Toledo with the syndicate which built the Toledo & Western Railway and acted as purchasing agent, paymaster and claim agent during the construction period. After the completion of the road he served for four years as chief clerk to the general manager of the company. Mr. Clark was also auditor and assistant secretary of the Patrick Hirsch Company, which built and equipped the Toledo & Indiana Railway and partly built the Toledo, Ann Arbor & Detroit Railway.

Mr. John F. Meany, private secretary to Governor Walsh, has been appointed a member of the Massachusetts Public Service Commission. In announcing the appointment, Governor Walsh said that he considered Mr. Meany especially well qualified for the position in view of his intimate knowledge of pending railroad questions secured in his four years' service in the Legislature and also at conferences this year concerning the New York, New Haven & Hartford Railroad. Mr. Meany was born in North Scituate, R. I., in 1880, and was educated at the Boston University law school. In 1910 he was appointed special justice of the Second District Court of Southern Worcester County, and later in the same year he served in the Senate. In 1911 to 1913, inclusive, he was a member of the House, becoming the Democratic floor leader. As a member of the judiciary committee he was active in framing the workmen's compensation law of Massachusetts. He was also a member of the recess committee appointed in 1912 to consider the question of trolley development in western Massachusetts. He succeeds Mr. George W. Bishop, who recently resigned after eighteen years' service to become the head of the inspection department of the commission.

Mr. William R. Dunham, Jr., has been appointed engineer of the Connecticut Company, New Haven, Conn., to succeed Mr. E. C. Webster. Mr. Dunham was born in Providence, R. I. He entered the engineering department of the Union Railway, now the Rhode Island Company, in March, 1892, as a rodman and advanced through various positions to principal assistant in charge of civil engineering. He resigned from the Rhode Island Company in July, 1906, to become assistant in the engineering department of the Connecticut Company, formerly the Consolidated Railway, with headquarters at New Haven. On July 1, 1914, he was appointed engineer in charge of the department. Mr. Dunham designed and patented an attachment for street railway switches in 1902 which has since been quite generally adopted. He also worked out and put into operation a new system of transfers for the Rhode Island Company in 1902. Mr. Dunham has also succeeded Mr. Webster as engineer of the New York & Stamford Railway, Port Chester, N. Y., and as engineer of the Westchester Street Railroad, White Plains, N. Y. He is a member of the American Society of Civil Engineers, the Connecticut Society of Civil Engineers and the New England Street Railway Club, and an associate member of the American Electric Railway Association.

OBITUARY

Ernest L. Carr, treasurer of the United Electric Securities Company, Boston, died on July 14 at his home in Melrose, Mass.

Abner C. Goodell, for nineteen years president of the Naumkeag Street Railway, Salem, Mass., which was the predecessor of the Salem division of the Bay State Street Railway, died at his home in Salem on July 20 at the age of eighty-two. He was for many years secretary of the Peabody Academy of Science and was noted in New England as an historian and editor, besides being active in legal and genealogical circles.

William S. Loomis, president of the Holyoke (Mass.) Street Railway, died at Southwest Harbor, Maine, on July 10. Mr. Loomis was closely identified with the banking, business and transportation interests of Holyoke for many years. He was editor of the Holyoke *Transcript* from 1872 to 1888 and in the latter year became general manager of the local horse railway lines, which he gradually developed. At the time of his death he was also president of the Mt. Tom Railroad.

A. A. Anderson, a former president of the Central Electric Railway Association, died at Indianapolis on July 12. Mr. Anderson was formerly connected with the Indianapolis & Louisville Traction Company, Louisville, Ky., and also with the Indianapolis, Columbus & Southern Traction Company, Columbus, Ind., as general manager. Later he was connected with the Springfield (Ill.) Consolidated Railway as general manager, which position he gave up to become associated with the Middle West Utilities Company, Chicago, Ill.

RECENT INCORPORATIONS

***Montecito Railway, Los Angeles, Cal.**—Incorporated in California to build an electric railway in Los Angeles to connect Griffin Avenue, Avenue Forty-three and Mount Gillig, a distance of 2½ miles. Capital stock, $60,000. Incorporators: W. D. Lawrence, E. T. Wright and Ross Welch.

***Export Phosphate Railway & Terminal Company, Tampa, Fla.**—Application for a charter has been made by this company in Florida to build a 50-mile interurban railway to be operated by electricity, steam or any other motive power from Tampa through Hillsborough and Polk counties to a point on the eastern boundary of Polk County. Capital stock, $50,000. Incorporators: E. L. Blood, H. E. Capewell and E. Albert Pierce.

***Lee County Central Electric Railway, Amboy, Ill.**—Incorporated in Illinois to build an electric railway from Amboy to Rochelle, Ashton, De Kalb, Dixon, Mendota, Princeton and intermediate points. Capital stock, $250,000. Incorporators: Sherman L. Shaw, Elijah L. King, Henry W. Hillison, Andrew Aschenbrenner and Alfred H. Nichols.

***Wilmington & Fort Fisher Railway, Wilmington, N. C.**—Chartered in North Carolina to build an 18-mile electric railway from Wilmington to Fort Fisher Sea Beach. This line will have no connection with the Wilmington & Carolina Beach Railway, which plans to build a line between Wilmington and Carolina and Wilmington beaches. Capital stock, $125,000. Incorporators: H. A. Kure, Sr., H. A. Kure, Jr., William L. Kure and Lawrence Kure.

***Dodge County Electric Railway, Mayville, Wis.**—Chartered in Wisconsin to build an electric railway to connect Mayville, Horincan, Juneau, Rolling Prairie, Beaver Dam, South Beaver Dam, Columbus and intermediate points. Capital stock, $25,000.

FRANCHISES

Medicine Hat, Alta.—The City Council has authorized the city engineer to prepare estimates of the cost of electrifying the line built by the city to connect with the Ansley coal mine in Medicine Hat.

Los Angeles, Cal.—The Pacific Electric Railway has received a forty-year franchise from the Council for an elevated railroad from the company's Sixth Street station to San Pedro Street in Los Angeles.

Healdsburg, Cal.—Alfred D. Bowen has asked the Council for a franchise to build an electric railway in Healdsburg. He has also asked the Board of Supervisors for a franchise to build an electric railway from Healdsburg through Sonoma County, 11 miles. Preliminary arrangements are being made to begin the construction of this proposed line in the near future.

San Francisco, Cal.—The Board of Supervisors has requested that the city engineer immediately prepare plans and specifications for the extension of the municipal railway lines into the Potrero and Sunset districts in San Francisco. It is proposed to extend the railway through Golden Gate Park from Tenth Avenue in the Richmond district, to the south side of the park, and the Potrero Avenue line into the Scotch Hills section, according to resolutions introduced in the Council.

Freeport, Ill.—The Freeport Railway & Light Company has received a franchise from the Council to extend its lines in a southwesterly direction on Chicago Street to reach the schools and St. Francis Hospital, thence west to West Street, to a point near the city cemetery in Freeport.

Peoria, Ill.—The Peoria Electric Railway has received a franchise from the Council to double-track its line on Main Street from Elizabeth to Western Avenue in Peoria.

Lafayette, Ind.—The Lafayette & Northwestern Railroad has received a franchise from the Tippecanoe County Commissioners through Tippecanoe County. This is part of a plan to build a line from Lafayette to Chicago via Rensselaer and Hammond. [E. R. J., June 20, '14.]

Hopkinsville, Ky.—The sale of a franchise to maintain and operate an electric railway in Christian County has been ordered for the first Monday in August by the Fiscal Court, the franchise to run for twenty years and to provide for the manufacture and distribution of electricity. R. E. Cooper and John H. Ball asked for the franchise, which has been advertised by L. J. Harris, clerk of the Fiscal Court.

Brockton, Mass.—The Bay State Street Railway has received a franchise from the Council to double track its line on Crescent Street from Quincy Street to the Whitman line in Brockton.

Franklin, Mass.—The Medway & Dedham Street Railway has asked the Council for a franchise on Main Street in Franklin, from Emmons Street to the Medway line. [E. R. J., June 27, '14.]

Portland, Ore.—The Portland & Oregon City Railway has received a franchise from the Council over East Twenty-fourth Street in Portland in place of the original routing over East Twenty-eighth Street.

Montreal, Que.—The Montreal Tramways Company has asked the Council for a forty-year extension of time on its franchise in Montreal.

Nashville, Tenn.—The Nashville Railway & Light Company has received a franchise from the Council to move its tracks on the Harding road in Nashville.

Nashville Tenn.—The Nashville-Gallatin Interurban Railway has asked the Davidson County Court for a franchise along the former roadbed of the Louisville & Nashville Railroad to Ridgetop, from Edenwold, where connection will be made with the Nashville-Gallatin interurban, and for permission to cross county highways at various points.

Nashville, Tenn.—The Tennessee & Kentucky Interurban Electric Railway has received a franchise from the Council along White's Creek pike in Nashville. This company plans to build an electric line from Nashville to Adairville, via Goodlettsville, White House, Cross Plains and Lamont, Tenn. [E. R. J., Jan. 17, '14.]

Dallas, Tex.—John T. Jones and associates have asked the Council for a franchise to build an electric line on Parry Avenue, between Kentucky Street and Henderson Avenue, in Dallas. [E. R. J., May 23, '14.]

Seattle, Wash.—The City Council has refused to grant a franchise on Avalon Way to the Puget Sound Traction, Light & Power Company. The acceptance of the company was based on a discontinuance of service on the line operating through Youngstown. The company refuses to operate both lines.

Seattle, Wash.—A resolution to extend Division "A" of the Seattle Municipal Railway into Ballard over the new bridge authorized by the voters at a recent election has been introduced in the Council by Councilman Ira D. Lundy. Division "A" at present extends from Fourth Avenue and Pine Street to Nickerson Street, which is some distace from Ballard.

Eau Claire, Wis.—The Chippewa Valley Railway, Light & Power Company will ask the Council for authority to abandon its interurban line on Franklin, Fay, Putnam and Omaha Streets upon the completion of its new line along Madison Street, Mount Tom Park and Stary Avenue in Eau Claire.

TRACK AND ROADWAY

Lacombe & Blindman Valley Electric Railway, Lacombe, Alta.—The general route of this company's line will be from Lacombe, westerly to the south end of Gull Lake, approximately 11 miles, then west to Bentley, 8 miles, thence following the Blindman River Valley to Rimbey, 14 miles. The line will be built on a private right-of-way, with a gradient 1 per cent compensated, and a maximum curvature of 6 deg. Corrugated iron and cedar box culverts will be used. A wooden trestle 700 ft. long and 60 ft. high will be built across Outlet Creek running from Gull Lake into the Blindman River. The track will be built with 60-lb. steel rails, Grand Trunk Pacific Railway specifications. Farncomb & Inkster, Edmonton, Alta., are the engineers. [E. R. J., June 13, '14.]

Little Rock & Hot Springs Electric Railway, Little Rock, Ark.—Financial arrangements have been completed by this company and plans are being made to begin the construction of this line between Hot Springs and Little Rock in the immediate future.

British Columbia Electric Railway, Ltd., Vancouver, B. C.—This company is asked to consider plans to extend its lines on Fifty-fifth Avenue between Victoria Road and Kerr Road in Vancouver. Material is being assembled for the extension of the line from Burnside Road to Harriet Road, Victoria. A contract has been awarded to M. J. Coughlan & Sons for the substructure of a steel bridge across False Creek at Kitsilano, on the Eburne line, to replace the present wooden trestle.

Northern Electric Company, Chico, Cal.—General manager McGovern of this company has been authorized by the board of directors to expend $50,000 for improvements of this railway. The work will consist of reballasting the main roadbed of the entire system and replacing the wooden culverts with concrete.

Fresno (Cal.) Interurban Railway.—This company has placed in operation its line between Fresno and Belmont Avenues in Fresno and Alvina Heights, a distance of about 2 miles. J. B. Rogers, Fresno, president. [E. R. J., July 18, '14.]

***Montecito Railway, Los Angeles, Cal.**—This company has applied to the State Railroad Commission for a certificate of public convenience and necessity to build an electric railway between Griffin Avenue, Avenue Forty-three and Mount Gillig, a distance of 2½ miles in Los Angeles. Among those interested are: W. D. Lawrence, E. T. Wright and Ross Welch.

Pacific Electric Railway, Los Angeles, Cal.—Work will be begun by this company improving its right-of-way on North Lake Avenue in Pasadena. Double tracks are to be placed from Colorado Street to Washington Street and new pavement laid. The company has placed in operation its 1-mile Broadway branch in Glendale.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—This company has awarded a contract to the San Francisco Bridge Company for driving and furnishing creosoted piling along the Key Route mole from the rock bulkhead to the end of the pier in Oakland. The total contract will amount to $270,000.

San Francisco, Cal.—The Board of Supervisors has requested that the city engineer immediately prepare plans and specifications for extensions of the municipal electric railway lines into the Potrero and Sunset districts in San Francisco. It is proposed to extend the system through Golden Gate Park from Tenth Avenue, in the Richmond section, to the south side of the park, and the Potrero Avenue line into the Scotch Hill section, according to resolutions on the subject introduced by Supervisor Vogelsang.

Miami (Fla.) Traction Company.—Plans are being made by this company to expend $150,000 on improvements and extensions of its lines in Miami.

Macon Railway & Light Company, Macon, Ga.—Extensive improvements of its lines in Macon are planned by this company.

Bruneau, Idaho.—J. H. Seaver, assistant superintendent, and W. Wallace, general manager of the Electric Light & Power Company, are making preliminary arrangements to build an electric railway between Bruneau and Glenns Ferry within the next few months.

Idaho-Pacific Railway, Twin Falls, Idaho.—The Twin Falls Commercial Club is back of the proposition to build this electric railway from Twin Falls to Hagerman, via Castleford, to connect with the Oregon Short Line Railroad. It is purposed to raise $100,000 by donations and sale of stock among the citizens of Twin City and other cities which will be benefited. No money will be called for until the grade is completed from Twin Falls to Castleford, when one-half of the money subscribed or donated will be asked for. One-quarter of the money will be called in when the track is laid 12 miles from Twin Falls and the remaining fourth will be due when the track is completed from Castleford to Main and Shoshone Streets, Twin Falls. The co-operation of the citizens of Twin Falls has been requested in securing a right-of-way for a distance of 2 miles from the city limits and in obtaining necessary franchises. A. L. Swim of the Commercial Club is the official head of the proposed company. [E. R. J., June 13, '14.]

Danville Street Railway & Light Company, Danville, Ill.—This company is engaged in the work of laying heavier steel on the east track on North Vermilion Street in Danville, the rails being of the 73-lb. variety. The west track will be relaid as soon as the east track is completed.

East St. Louis & Suburban Railway, East St. Louis, Ill.—Plans are being made by this company to extend its Eighteenth Street line in East St. Louis to Jones Park during the summer.

Freeport Railway & Light Company, Freeport, Ill.—Plans are being considered by this company to extend its line on Chicago Street southwesterly to West Street in Freeport.

Quincy (Ill.) Railway.—A total of $83,959 will be expended this year for improvements to this company's lines in Quincy.

Indianapolis & Delphi Traction Company, Indianapolis, Ind.—No definite plans have yet been made when the construction of this line will be begun between Delphi, Flora, Burlington and Sheridan. Henry L. Smith, general manager. [E. R. J., May 23, '14.]

Evansville & New Harmony Traction Company, Evansville, Ind.—The survey of the proposed line from Evansville to New Harmony has been completed and as soon as the bonds are floated it is announced that construction will begin. The route will pass through the "pocket," a rich trucking region. It is probable that the line in time will be extended to Mt. Carmel, Ind. [E. R. J., May 23, '14.]

Fort Dodge, Des Moines & Southern Railroad, Boone, Ia.—Plans are being considered by this company for an extension of its tracks to West Fort Dodge across the Bennett viaduct.

Tri-City Railway, Davenport, Ia.—Work will soon be begun by this company on the construction of its Fourth Street line in Moline.

Union Electric Company, Dubuque, Ia.—This company has placed in operation its extension which will connect the West Locust Street line and the Eighth Street line in Dubuque.

Kansas-Oklahoma Traction Company, Coffeyville, Kan.—This company has purchased overhead material for its 20-mile line from Coffeyville, Kan., to Nowata, Okla. The line will be of direct suspension 600-volt construction, and Ohio Brass Company material will be used throughout. Ten-foot flexible pole brackets will be used, together with large round top hangers, having a lock feature which gives a tight joint between hanger and car. A 20,000-volt transmission line is to be carried by the trolley poles in addition to feeder and telephone service.

Hutchinson & Northern Railway, Hutchinson, Kan.—Plans are being considered by this company to begin work in the near future on its 14-mile line between Hutchinson and Burrton. George Theis, Jr., president. [E. R. J., March 7, '14.]

Independence, Neodesha & Topeka Traction Company, Independence, Kan.—An election will be held at Neodesha shortly to vote bonds to the proposed interurban line between Neodesha and Independence. Enough names have been signed to the petition to insure the election. T. J. Booth, president. [E. R. J., July 4, '14.]

Arkansas Valley Interurban Railway, Wichita, Kan.—This company will extend its lines from Halstead to Hutchinson in the near future. Negotiations are being held with a view of utilizing the tracks of the Hutchinson Interurban Railway in entering Hutchinson. If this plan fails, the Arkansas Valley Interurban line will apply for a franchise and build its own tracks in Hutchinson.

New Orleans Railway & Light Company, New Orleans, La.—Grading has been begun by this company on its Claiborne Avenue extension in New Orleans.

Winnipeg (Man.) Electric Railway.—Work will be begun at once by this company on the Kern Street line extension to Transcona.

Boston & Western Electric Railroad, Boston, Mass.—This company is still endeavoring to complete its right-of-way. There is yet to be obtained the assent of the Aldermen of Marlboro and of the Selectmen of Maynard to that part of the route, as fixed by the Board of Railroad Commissioners, which is located on highways in these two localities. The local authorities, in giving assent, may impose terms and conditions, which in turn must be approved by the Public Service Commission. Surveys have been completed for this 22-mile line to connect Waltham, Marlboro, Sudbury, Weston, Wayland and Maynard and Boston. [E. R. J., Feb. 1, '13.]

Detroit, Almont & Northern Railway, Detroit, Mich.—Nearly 11 miles of track has been completed by this company on the section of its line between Romeo and Almont, and surveys have been completed from Almont to Imlay City. F. W. Brooks, 12 Woodward Avenue, Detroit, Mich., president. [E. R. J., Dec. 6, '13.]

Grand Rapids (Mich.) Railway.—Work has been begun on the Madison Square railway extension from Hall Street south to Burton Street in Grand Rapids.

Springfield (Mo.) Traction Company.—The immediate construction of three extensions in Springfield and of a line to connect with near-by towns is being contemplated by this company.

Billings (Mont.) Traction Company.—Plans are being considered by this company to extend its lines in Billings and build an extension to Laurel.

Pelham Park & City Island Railroad, Bronx, N. Y.—The Public Service Commission for the First District, New York, received word recently from Edward A. Maher, general manager of the Pelham Park & City Island Railway, that the laying of rails for the new line would begin very soon, and that the work would be completed and the cars would begin to run in a short time. After the line is completed connection will be made with the Union Railway Company's line in the Bronx.

Goldsboro (N. C.) Traction Company.—This company advises that it is now re-establishing the service on ½ mile of its present system, and that as soon as the material can be ordered 1 mile of new track will be laid and $10,000 will be spent on improvements.

Choctaw Railway & Light Company, McAlester, Okla.—This company has placed in operation a 5-mile line between Lawton and Fort Sill.

***Baker, Ore.**—Preliminary arrangements are being made to build an electric railway in Baker and extend it to Eagle Valley, 45 miles beyond Baker in the northeastern part of the county. Among those interested are Joseph Kries, John B. Yeon, Portland, and others connected with the Eagle River Electric Company.

Bucks County Electric Railway, New Hope, Pa.—An extension up North Main Street in New Hope is being contemplated by this company.

North Anderson Street Railway, Anderson, S. C.—This company has placed in operation its new North Anderson extension.

Dallas (Tex.) Consolidated Electric Railway.—This company has placed in operation its new line on Hillcrest Avenue almost to the Southern Methodist University. From its terminus the university officials will construct a line of their own to the institution.

West Virginia Traction & Electric Company, Wheeling, W. Va.—Extensive improvements are being made by this company on its line between Wheeling Park and Greenwood Cemetery. The track is being entirely rebuilt and new ballast is being placed under it.

Janesville & Madison Traction Company, Madison, Wis.—This company has awarded a contract to M. M. Doran, Madison, to build the section of the route between Edgerton and Stoughton. The route of this line is divided into three divisions; the first extends between Janesville and Edgerton, the second between Edgerton and Stoughton and the third between Stoughton and Madison. The railway will connect with the line of the Southern Wisconsin Railway at Fair Oaks. G. Pickhardt, 409 Washington Building, Madison, president. [E. R. J., July 11, '14.]

SHOPS AND BUILDINGS

Edmonton (Alta.) Radial Railway.—Out of the money authorized to be raised under the recent by-laws, $15,573 has been set aside by the Edmonton City Council for a site for a new carhouse in Edmonton.

Georgia Railway & Electric Company, Atlanta, Ga.—Work will shortly be begun by this company on its new freight depot on Butler Street in Atlanta. The structure will be 100 ft. x 200 ft. The cost is estimated to be about $7,000.

Savannah (Ga.) Electric Company.—This company has awarded a contract to A. A. Artley, Savannah, to rebuild its carhouse in Savannah. The new structure will be of brick construction and modern in all the requirements. The cost is estimated to be about $25,000.

Winnipeg (Man.) Electric Railway.—Property has been secured with 300 ft. of frontage on Main Street, Stonewall, for terminals and passenger station for this company.

Public Service Railway, Newark, N. J.—This company has awarded the contract for the erection of the new terminal building in Newark to the Hedden Construction Company. The structure is to be ready for occupancy by January, 1916.

International Traction Company, Buffalo, N. Y.—A new terminal station at Hawley Street in Lockport is being contemplated by this company.

Goldsboro (N. C.) Traction Company.—Among the improvements planned by this company in the near future will be the installation of new tracks and pits in its carhouse in Goldsboro.

Toronto (Ont.) Civic Car Lines.—The plans of the new carhouses for the eastern division of the Civic Car Lines in Toronto were approved by the Board of Works Committee of the City Council, and the commissioner was authorized to advertise for bids for the construction of same.

Seattle (Wash.) Municipal Railway.—Plans are being made by this company to build a new carhouse in Seattle.

POWER HOUSES AND SUBSTATIONS

Quincy (Ill.) Railway.—Among the improvements planned by this company during the year will be the installation of new equipment at its power house at a cost of $3,210.

Union Traction Company, Coffeyville, Kan.—A new substation will soon be built by this company at Delaware, Kan., probably in connection with a new passenger depot to be constructed.

Holyoke (Mass.) Street Railway.—This company has purchased about eight acres of land on the east side of South Pleasant Street at Mill Valley, and will construct a new power plant on the site to be used for the Amherst and Suderland division. On the completion of the large unit machinery in Holyoke to operate the electric cars in the city and immediate environs, the lighter machinery will be removed to Amherst and installed to furnish the additional power which is needed on this side of the mountain.

Ephrata & Lebanon Street Railway, Ephrata, Pa.—This company plans to install in its power house at Ephrata two 300-kw, 600-volt, six-phase, twenty-five-cycle, 750 r.p.m. commutating pole rotary converter; one 300-kw, 600-volt, twenty-five cycle, portable substation car complete, suitable for 11,000-volt high tension. This apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Saskatoon (Sask.) Municipal Railway.—Plans are being made by this company soon to build a new power house in Saskatoon.

Southwestern Gas & Electric Company, Texarkana, Tex.—Two 35-kw, 125-volt, 315 r.p.m. type Q generators have been ordered by this company from the Westinghouse Electric & Manufacturing Company.

Monongahela Valley Traction Company, Fairmont, W. Va.—This company has decided to abandon its $300,000 power plant in Fairmont and will build a new gas engine plant at Hutchinson.

Manufactures and Supplies

ROLLING STOCK

Richmond Light & Railroad Company, New Brighton, S. I., is considering the purchase of thirty new cars.

Macon (Ga.) Railway & Light Company, according to a report, will purchase ten cars.

London (Ont.) Street Railway has issued inquiries on ten 26-ft. double-truck suburban car bodies.

St. John (N. B.) Railway has received two new steel cars from the Ottawa Car Manufacturing Company, Ottawa, Ont.

Wellsburg, Bethany & Washington Railway, Wellsburg, W. Va., expects to purchase a light second-hand double-truck passenger car.

Niagara, St. Catherines & Toronto Railway, St. Catherines, Ont, has received six double-end, double-truck, pay-as-you-enter cars from the Preston Car & Coach Company. They are mounted on standard trucks. The electrical equipment is Canadian Westinghouse 101-B2 quadruple equipment with K28 control, and Westinghouse SM1 air brakes. The cars are 30 ft. 10 in. long over corner posts, platforms 6½ ft. long, seats upholstered in rattan.

Trenton, Bristol & Philadelphia Street Railway, Philadelphia, Pa., noted in the ELECTRIC RAILWAY JOURNAL of May 23, 1914, as having ordered five double-truck closed cars from The J. G. Brill Company, has specified the following details for this equipment:

Seating capacity	48
Length of body	30 ft. 6 in.
Length of vestibule,	42 ft. 6 in.
Width over sills	8 ft.
Width over posts at belt,	8 ft. 2 in.
Height from top of rail over trolley base,	11 ft. 6 in.
Body	Composite
Interior trim	Bronze
Underframe	Metal
Air Brakes	National
Bolsters	Cast steel
Bumpers,	Hedley anti-climber
Car trimmings	Brill
Control	K-36
Couplers	Brill Portable
Curtain fixtures	Cur. Sup. Co.
Curtain material	Pantasote
Destination signs	Hunter
Fenders	H. B.
Gongs	Brill Dedenda
Hand brakes	Peacock
Heating system	Peter Smith
Motors, 2	West. No. 305
Push-button signals,	Consolidated
Registers,	Sterling-Meaker No. 5
Roofs	Wood plain arch
Sanders	Brill Dumpit
Seats	Brill Winner
Seating material	Cane
Track scrapers	Brill
Trolley retrievers	Keystone
Trucks	Brill 39-E

The Ithaca (N. Y.) Street Railway has specified the following details for the five closed prepayment and five open cars recently ordered from the Wason Manufacturing Company:

	Closed Cars	Open Cars
Seating capacity	38	50
Weight of car body	19,000 lb.	15,000 lb
Length of body	20 ft. 8 in.	28 ft. 8 in.
Length over vestibule	31 ft. 2 in.	
Width over sills	8 ft. 5 in.	6 ft. 3 in.
Width over all	8 ft. 6 in.	7 ft. ½ in.
Height, sill to trolley base.	8 ft. 6 in.	
Control	K-36	K-12
Motors	2-GE-201	2-GE-1000
Seats	Brill, Winner, rattan	wood

The following details are specified for both closed and open cars:

Axles	Brill
Bumpers	Brill
Cables	G. E.
Car trimmings	Brill
Couplers	Brill
Curtain fixtures	Brill
Curtain material	Pantasote
Destination signs,	Hunter and special
Gears and pinions	G. E.
Gongs	Brill
Headlights	Golden Glow
Heaters	Consol.
Journal boxes	Brill
Registers	International
Sanders	Brill
Sash fixtures	Brill
Springs	Brill
Trolley base	U. S.
Trucks	21-E.
Underframe	composite
Ventilators	Brill
Wheels	Brill

TRADE NOTES

A. Eugene Michel, New York, N. Y., has changed its Chicago office from the Rookery to 225 East Twenty-sescond Street.

Naugle Pole & Tie Company, Chicago, Ill., has opened an eastern office at 21 South High Street, Columbus, Ohio, in charge of Laurence E. Morier.

Terry Steam Turbine Company, Hartford, Conn., has recently received an order for twenty turbines for the new power station of the Philadelphia (Pa.) Electric Company.

Carnegie Steel Company, Pittsburgh, Pa., has appointed John W. Dix as assistant general manager of sales and structural engineer, succeeding John C. Neale, resigned.

John C. Neale has resigned his position as assistant general manager of sales and structural engineer of the Carnegie Steel Company, Pittsburgh, Pa., to become president and general manager of the Central Steel Company, Massillon, Ohio.

H. W. Johns-Manville Company, New York, N. Y., owing to the rapid growth of its lighting fixture business, has established a new division of its electrical department, which will be known as the Lighting Division. The new division will have charge of the company's business in the Frink and J-M Linolite systems of lighting, and will enlarge the scope of the company's business and service in lighting fixtures in general, by the addition of many new lines. Sales will be under the direction of Edward L. Cox, manager. Mr. Cox is well-known in the trade through his long connection with the Enos & Watkins Company, formerly the Enos Company. G. Eugene Villaret will have charge of designs. The new division will be prepared to furnish from stock, designs in brackets, pendants, hangers, ceiling fixtures, glassware, etc., to meet practically all requirements. The lighting division will be prepared to execute orders for fixtures of all types in all materials, including glass, composition, brass, bronze, etc.

Union Switch & Signal Company, Swissvale, Pa., has appointed W. D. Uptegraff as president, succeeding Col. H. G. Prout, resigned. Mr. Prout graduated from the University of Michigan in 1871. In 1873 he served as major of the engineers and later colonel of the general staff of the Khedive of Egypt. He commanded an expedition in the Soudan and was Governor of the Provinces of the Equator. After this service he became editor of the *Railroad Gazette*, which position he held for sixteen years. In 1903 he was appointed vice-president and general manager of the Union Switch & Signal Company, and about three months ago succeeded the late George Westinghouse as president. Mr. Uptegraff, the new president, has been closely identified with the Westinghouse concerns, including the Westinghouse Machine Company and the Westinghouse Air Brake Company. In 1907 he became financial adviser of the late George Westinghouse. Upon Mr. Prout's appointment as president Mr. Uptegraff succeeded him as vice-president, which office he has held up to the present time. Sydney G. Johnson, vice-president in charge of sales, has also resigned, no successor being appointed. T. W. Siemon, treasurer and assistant secretary of the Westinghouse Electric & Manufacturing Company, has been made secretary-treasurer of the Union Swith & Signal Company, succeeeding James H. Johnson, resigned.

ADVERTISING LITERATURE

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued a catalog describing its small motors.

Ohmer Fare Register Company, Dayton, Ohio, has issued a folder entitled "A Game of Checkers," which describes its merit analysis system of fare-registering service.

Buckeye Engine Company, Salem, Ohio, has issued a special bulletin which contains a reprint of an article published in *Power* entitled "First Buckeye Mobile in Commercial Service in America."

Harris Patents Company, Philadelphia, Pa., has issued a large catalog entitled "Stone Cold to Full Power in Ten Seconds," which describes valveless engines, Diesel principle, for power generation, locomotives, interurban cars and other purposes.

Allis-Chalmers Manufacturing Company, Milwaukee, Wis., has issued Catalogs Nos. 100 and 103, written in Spanish, describing and illustrating its machinery for refining metals and its dynamos, motors, steam and gas engines, air compressors and steam turbines. The catalogs contain illustrations of an installation of a double-expansion vertical steam engine in a power house of the London (Eng.) United Tramways, Ltd., and of three large transformers installed outside a power house of the Southern Power Company.

The Allen-Bradley Company, Milwaukee, Wis., has issued Bulletin B-571, describing its speed regulators for slip-ring induction motors for driving fans and other machinery. These regulators are designed to reduce the speed of two and three-phase slip-ring motors by introducing resistance into the secondary circuit. The resistance units are of the carbon compression type. The speed of the motor is changed by turning a hand wheel, and instant adjustment can be obtained between minimum and full speeds regardless of the load of the motor.

H. F. McConnell & Company, New York, N. Y., have issued a 44-page pamphlet giving a select list of public utility investments. In selecting these securities the company states that it has endeavored to compile only those offering sound underlying values, substantial earning power and attractive future possibilities of market improvement. Holding company securities are especially featured. The last pages of the pamphlet are devoted to an interesting compilation of facts concerning public utility development, a table showing what one cent's worth of electricity will do and a tabulation giving the approximate yield of stocks paying from 2 per cent to 9 per cent and ranging in selling price from 10 to 150.

NEW PUBLICATIONS

Electric Light Accounts. By H. M. Edwards. McGraw-Hill Book Company. Leather bound, 172 pages, $2 net.

Mr. Edwards, who is auditor of the New York Edison Company, in this book gives the first adequate treatment of the subject of electric light accounts. The system of accounts is not in all its details the one followed by the New York Edison Company or the one adopted by the National Electric Light Association. The differences are not material, however, and the chief value to the reader lies in the explanations that accompany the accounts or their "significance," as it is termed by the author. The book is divided into three parts, treating balance sheet or indicant accounts, income accounts and miscellaneous subjects. The first two parts take up in a concise and thorough fashion the accounting structure of an electric light system. The third part discusses more at length some of the important topics that arise in electric-light accounting, such as account symbols, a work order system, customers' accounts and records, accounting for supplies, renewal reserves, the contents of the income statement and the analysis of the balance sheet. The book is particularly of value to electric-light employees, but it should be interesting to all accountants in the public-utility field.

Accounting Practice and Procedure. By A. L. Dickinson. Ronald Press Company, New York. 300 pages. Cloth binding, $3; half leather binding, $3.50.

This book is a radical departure from previous accounting works inasmuch as it deals almost entirely with problems of practice which heretofore have had to be worked out largely by judgment and analysis of the individual case. The entire experience of the author is brought to bear in a discussion of the exceptional problems that arise in accounting practice. The general arrangement of the book is such as to bring out the more important features. Bookkeeping is covered in a single chapter in a sufficiently comprehensive manner, but six full chapters are devoted to a discussion of the balance sheet. Corporation accounting and cost accounting are given a full chapter each, and the remainder of the book treats thoroughly of the duties and liabilities of the public accountant and work with involving prospectuses, certificates of financial position, possible earnings, liquidations and the like. Two chapters which should be of particular interest to electric railway accountants are those dealing with repairs, renewals, depreciation and reconstruction, and with special points in corporation accounting and finance. This latter topic covers the following points: accounting for holding companies, previous earnings before date of consolidation and questions arising upon the organization of a corporation. To those accountants who would be interested in having a general view of the English and Canadian law relative to auditing and similar topics the appendices as compiled by the author should prove invaluable.

Express Service and Rates.—By W. H. Chandler. La Salle Extension University, Chicago. 140 pages.

While this book contains only one chapter devoted exclusively to express service in connection with the electric railway industry, it gives a general treatment of the whole subject of express service and rates that should be of value to all electric railway officials. The book is written from both and historical and analytical standpoint and gives a thorough exposition of express service from the time of the first express car (which was merely a valise) up to the ramified service of to-day with its various tariffs. The author discusses the financial relations between express companies and railroads, contracts with carriers, the regulation of express companies and various other points dealing with their rate schedules. He states that in the Central Western States and in the Northern Atlantic Coast and Pacific Coast territory the carrying of freight and express by electric railways has become an established institution, and that while but 1.7 per cent of the gross earnings of these electric railways in 1907 were derived from their freight and express traffic, the advantage of such service has had an important effect upon the interchange of goods in rural districts. The traffic handled at the present time falls into the three general groups of farm produce, carload service in feeding railroad lines, and baggage and light parcels service in cities. The next to the last chapter in the book is devoted to a discussion of the parcels post and the express companies under the new rates. The author concludes that express companies can serve the public better on certain classes of traffic than can the post-office and that these companies will in the future find their sphere of usefulness increased rather than diminished.

A Study of Rapid Transit in Seven Cities.—Bulletin No. 3 of the Municipal Reference Library. Chicago Public Library, Chicago, Ill. 27 pages.

The present pamphlet was prepared under the direction of Theodore K. Long, member of the Chicago City Council, in co-operation with Frederick Rex, municipal reference librarian, City Hall, Chicago. The purpose of the pamphlet is to put in convenient and popular form a digest of rapid transit conditions in New York, Chicago, Philadelphia, Boston, London, Berlin and Paris. The pamphlet opens with tables showing the mileage of rapid transit lines in the cities named, and this is followed by paragraphs on the historical development of rapid transit in the same communities. The historical paragraphs also refer to the methods of financing and the character of franchises.

The section entitled "Comparative Cost of Subway and Elevated Railways" gives figures from such authorities as Bion J. Arnold, William Barclay Parsons, William S. Twining, John Vipond Davies, George K. Mohler, D. F. Wilcox and C. S. Sergeant. Mr. Sergeant's figures are those which were published in the ELECTRIC RAILWAY JOURNAL for Oct. 16, 1913. The Berlin and Philadelphia types of elevated railway construction are commended. Attention is called to the inconsistency of considering elevated electric railways as nuisances at the very time when Chicago demands that all steam railroads be placed on viaducts. Statistics are published of the passengers carried per year, per mile of track and per mile of route in New York, Chicago, London, Paris and Berlin.

The following sections relate to passenger traffic and rates and fare. It is noted that the average revenue per passenger abroad varies from 2.66 cents in Paris to 3.22 cents in London tubes as compared with 5 cents in the United States, but no parallel is given as to length of ride in each case. The longest section of the pamphlet is given up to a comparison of sanitary conditions and noise of subways and elevated railroads. The researches of Dr. George A. Soper on the sanitary condition of the air in the New York subways are quoted extensively, as are also the works of others who have written concerning dust-laden air.

In conclusion, the pamphlet summarizes in parallel columns the comparative advantages of subway and elevated railways as quoted from a report made by E. P. Goodrich and Harry P. Nichols, New York, upon "Elimination of Surface Freight Railroad Tracks of the New York Central & Hudson River Railroads."

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.
Consolidation of Street Railway Journal and Electric Railway Review

Vol. XLIV NEW YORK, SATURDAY, AUGUST 1, 1914 No. 5

MAXIMUM PROFITABLE RIDE The report on cost of individual passenger transportation in Boston, abstracted elsewhere in this issue, arrives at the conclusion that a 5-cent fare will permit a 4-mile ride for each passenger and just cover operating expenses, interest and depreciation. This rate of 1¼ cents a mile applies, of course, only to the conditions existing in Boston, and this rate could not be safely applied to any other set of conditions because of the effect upon the result of variations in the determining factors. If the average passenger is transported for his 4 miles in a badly under-loaded car, for example, it is hardly likely that the fare of 5 cents will prove profitable, and the same condition will exist if the schedule speed is unduly low, thereby limiting the effective work obtained from both car and crew. As a matter of fact it is probable that the latter possibility exerts a more potent influence upon profitable haul than the former, and for this reason the time basis really serves better for calculations and comparisons than the distance basis used, in this case, for Boston. Indeed, another of the large systems calculated some time ago that a twenty-two minute ride was the limit that could be given for a 5-cent fare, this, even under the high schedule speed of 10 m.p.h., being the equivalent of a distance of only 3.66 miles, while, with a 7-mile schedule speed, the profitable average haul is not more than 2.57 miles.

THE CONVENTION AND TECHNICAL EDUCATION The American Electric Railway Association, through the committee on education, is calling the attention of the technical colleges to the importance of promoting a closer relation between the teachers and the industry. An obviously simple means to this end is to secure the presence of a large number of representatives of the schools at the annual conventions of the association. One cause for complaint of the results of technical education is that the teachers are not as familiar as they might be with the conditions under which their students are to work later. They are so occupied with formulas and principles that they lack the stimulus which comes from contact with the men who are doing things, and the students suffer thereby. At the convention the teachers might not see many differential equations, which they could safely forget for the time being, but they would see some very fine specimens of adaptation of scientific principles to practice, and would meet the men who have the ability to make such adaptations. We see no valid reason why it is not just as important for the colleges to send representatives from their faculties to the conventions as for the railway companies to do so. The cost would amount to something, but it would be easily returned in the improved quality of instruction which would result. In some respects October is an unsuitable month for teachers to leave their duties, but, on the other hand, the convention inspiration would come at a time when it would have the maximum effect on the school work of the ensuing year.

MODERN SINGLE-TRUCK CARS A few years ago the single-truck car seemed doomed to die a natural death except in cities which were too small to use the large double-truck cars which were becoming more and more popular. No one would have ventured to foretell that the time would come when a large city company would actually discard double-truck cars in excellent operating condition for any kind of single-truck design. Yet this is precisely what the Third Avenue Railway System, New York, has done during the current year in ordering a total of fifty single-truck cars, of which forty-nine will have radial-axle trucks. In all likelihood additional cars of the same type will be ordered as soon as more of the older double-truck cars can be sold. The reason for this remarkable change of front is largely the radial-axle truck, which has made possible the selection of a convertible car body practically 35 ft. over all, a size which the operating company believes will prove ideal for service in the northern suburbs of New York City. This large order certainly shows that American operators are beginning to gain confidence in the principle of the radial-axle truck after a long period of experimental operation, especially on the electric lines of Great Britain. Mr. Steffen's article in this issue on his own recent design is another indication of the renewed interest in the radial-axle truck for moderate speed city service. Even the improved rigid-axle truck is still worthy of consideration. The determination of the Third Avenue System to replace heavy double-truck with light single-truck cars on its suburban lines is significant in many ways, but the one thing worth pointing out at this time is that the operator of a modern single-truck car has nothing to apologize for so long as that type makes ample service an economic possibility. The public must be educated to the fact that it would be as absurd for it to expect a metropolitan car in low-traffic service as to demand big-city standards in theaters and public buildings.

INFORMATIONAL CLEARING HOUSES

G. W. Lee, librarian for Stone & Webster, suggests that there should be created a central clearing house for knowledge on all subjects, to be located preferably in Washington. He calls attention to the present tendency of librarians to broaden their work in the direction of supplying information and believes that this indicates a need for a central reference bureau. As the principle underlying Mr. Lee's suggestion relates to the collecting and distributing of information of real value, it applies in the electric railway field if anywhere and is well worthy of consideration.

The ultimate source of knowledge is experience, but the amount of information which can be secured by an individual in this way is limited. Successful men must know much more than can possibly come within the range of their own personal experiences. Hence each man must spend time and effort in gathering for his own use the results of the experience of others. It is an obvious advantage if, when he does this, the results of his investigation can in some way be placed at the disposal of others. It is, in fact, his duty to do this in return for the help which he receives from other investigators. Suppose, for example, that the problem confronts a railway engineer as to whether it is advisable to creosote the ties in a certain stretch of track. The correctness of his conclusion depends upon his success in obtaining accurate and sufficient information based on the experience of others. His first step is to make a plan to secure this information. He consults the available reference literature and possibly writes to a few friends for their opinions. One source of information leads to another until finally he feels warranted in reaching a decision. The matter of creosoting ties, however, affects not only this one man but hundreds of others. He has done a great deal of work in getting certain information. It is a waste of time for the other hundreds to go through the same tedious process. If the first man had some easy way of filing his memoranda where they would be accessible he would undoubtedly be glad to do so.

At present this man, if he files his information at all, would probably do so with the appropriate committee of the American Electric Railway Engineering Association, the American Wood Preservers' Association, or whatever other society would be interested. This is good as far as it goes. It is possible, however, to imagine the libraries of the country to be so organized, with a central clearing house, that each individual would file his data with the local librarian, who would forward it to the central agency, from which it would be distributed to all libraries in the country. If then another railway man desired to know what there is to be known upon the subject in question, he could apply to any library with a reasonable assurance of success.

The apparent weakness of this scheme is that it depends upon voluntary co-operation. The librarian has a considerable responsibility at this point and, under the proposed scheme, it would be his duty to keep in touch with all research work being done in his territory. This kind of work may seem quite different from that which is ordinarily expected of a librarian, but the librarians of the country are different now from what they used to be. The librarian is coming to be depended upon more and more as a source of information, and the books and periodicals which he keeps in his library are simply a means to an end. In the State of Wisconsin, for instance, one important section of the University extension department furnishes all kinds of information to inquirers, and this is used not only to satisfy the desire for knowledge, but also in the preparation of public addresses, debates, etc. The same principle could be applied on a larger scale for the whole country.

As Mr. Lee suggests, a movement for a central index bureau ought to be inaugurated by leaders in the library field, but it will take time to initiate this movement. In the meantime this paper will be glad to act as a clearing house for information relating to electric railways and will systematize the filing of such data of this kind as may be sent to it, so that the information will readily be accessible to subscribers. The editors believe that this is a part of their duty to their readers.

STORAGE BATTERY CAR LIGHTING

A feature of modern car equipment which illustrates the attention now given toward attaining the ideal of safe service is that of using storage batteries to insure the illumination of several emergency lamps at least. Doubtless the need for such an auxiliary is most acute on third-rail interurban lines operating single cars, where the absence of a train bus line means an annoying interruption of the lights at every grade crossing. A further advance is the introduction of electric marker and tail lights, which, from their character, should be connected to a storage battery rather than to the line. All will admit that an oil lamp is a decided anachronism on an electric car, but safe operation demands its use unless the supply of electricity is certain.

An excellent scheme in service on a large single-phase electrification in the United States is to keep the headlights, marker and tail lights in permanent, and a set of inside lamps in emergency, connection with a 32-volt battery. Again, where the multiple-unit control is operated with a storage battery, it has been found feasible to use it for a few emergency lights inside the car, if not for the operating purposes already named. A still wider use for the storage battery, however, lies in its application to the possible continuous supply of all the car lamps. Such an application was described in connection with the new cars of the Michigan United Railway in our issue of July 18.

For electric cars with the overhead system of line supply this plan may seem an unnecessary refinement. Nevertheless, with interurban lines the variations in voltage which are almost inseparable from operation will produce corresponding variations in illumination, and in such instances a storage battery system will insure an adequate supply of illumination for less money than additional feeders. Furthermore, the increases in

lamp efficiency and the decreases in battery weight so characteristic of recent years make the matter of extra weight of less importance than in the past.

COMPARATIVE COMMENT ON ENGLISH ALL-STEEL CARS

That the advantages of all-steel construction for electric railway cars have not been overlooked by European managements is shown by the description of two new rapid transit cars for London, published elsewhere in the issue. Both cars are intended for heavy, high-speed service and both are designed to haul trailers, so that the installation of 460 hp of motors on each car is not surprising. The fact that in each case this motive power is concentrated in two motors on one truck is, however, hardly in accordance with the trend of American practice, considering the comparatively small size of the car bodies, as is also the fact that the two cars, although they are being purchased by the same interests, display striking dissimilarities in fundamental design. It should be said, however, that each is an evolution from the types existing on the line for which it is intended.

It is of course difficult to subject to analysis types of construction that originate so far away as in England, but it is even more difficult to pass without comment the obvious inference that is to be drawn from a comparison of the two designs, one of which exemplifies the principle of the "house on the flat-car" that American designers are reluctantly beginning to give up.

The car in question is the one intended for the Metropolitan District Railway. Reference to the halftone of the framing which accompanies the article shows that, notwithstanding the superstructure of steel, the strains imposed by the load are obviously carried only by the floor framing, truss-rods even having been installed regardless of the incongruity of such a makeshift. The result is a car body 49 ft. long that weighs, fully equipped but without trucks, 43,680 lb. On the other hand, the car for the London Electric Railway, with 1 ft. more over-all length, has a body weighing but 34,000 lb., making it nearly 10,000 lb. lighter than the Metropolitan District Car which was, presumably, designed for use under generally similar conditions.

The reason for this extraordinary difference in weight is by no means obscure. The London Electric car is sheathed with ⅛-in. steel plate, and this permits the strains to be carried above the floor at least as high as the belt rail and possibly to the roof, the side sheathing acting as a girder to support the load as well as to protect the passengers within the car. By this means the shallow and heavy sills required by the old-style underframe are eliminated, and the weight of the body is obviously reduced to a marked degree. Indeed, it would be difficult to find a more striking practical example than these two cars of the utterly useless weight involved by adherence to the "house on a flat-car" school of design.

However, the mere adoption of sane principles of car construction does not cover all that can be accomplished in eliminating unnecessary weight. Even the lighter one of the two London cars, with its 50-ft. body weighing 34,000 lb., is still some 10 per cent heavier than is deemed necessary for similar service in this country. The body of the standard car of the Hudson & Manhattan Railroad is 48 ft. long and weighs fully equipped 30,000 lb. Even when the weight of the London car is scaled down to allow for its extra length, the Hudson & Manhattan car body is still 2600 lb. lighter. In view of the fact that the Hudson & Manhattan service could hardly be exceeded in severity and that the cars have withstood this service for nearly six years without the least sign of failure, this comparison of weights certainly redounds to the credit of American methods of design.

THE PROBLEMS OF THE INCLOSED PLATFORM

Anything which requires a change of habit on the part of the public is bound to create at first a feeling of dissatisfaction. Therefore it is not surprising to find in a number of cities a good many objectors to the closed-platform car. A newspaper account from St. Louis tells of a recent incident in that city in which ex-Governor Francis of Missouri was the principal actor. He reached a car with the intention of boarding it just after the door had been closed and as the car had begun to start. As he could not get on board he follow the car a block, only to repeat his previous experience in regard to losing the car but in time to break the glass of the door with his cane. He then ran after the car for another block where he boarded it and, as he paid his fare, gave his card to the conductor and asked him to tell the superintendent that he had broken the glass intentionally.

Governor Francis is probably one of those men whose only objection to the fully-inclosed car is that they cannot get on the car when it is in motion. Probably others who have missed a car under the same circumstances have felt the same way that he did but have not had the courage to break the glass. A few moments of thought, however, upon the reasons of the railway company for inclosing the car platform ought to convince such people that the plan is one adopted for their own good. With the rising generation it may be possible to inculcate a respect for this safety precaution, but with the older generation, many of whom learned the trick of boarding a moving car in the old horse-car days, the habit is still strong, and it cannot be stopped except by the fully-inclosed car.

While we are strong advocates of this type of car, we believe that companies would do well to adopt one or two precautions with it which were not necessary with the old type of car. One is to instruct the motormen and conductors to be more observant of passengers waiting to board the car than when the old form of open platforms was used. As we said recently in these columns, it is exasperating for a passenger who is on a corner ready to board a car to be unable to do so because the conductor is looking the other way and cannot be hailed because the platform is inclosed. The short-haul passenger is particularly one whom the railroads want to get, but a number of experiences of this kind will encourage many possible short-haul passengers to walk rather than ride.

COMPENSATION INSURANCE IN NEW YORK

The announced decision of the Brooklyn Rapid Transit Company to insure its own workmen under the new workmen's compensation law on the ground that the premiums demanded by the State fund or by insurance companies would be prohibitive, is of vast interest to the electric railways of New York State. The Interborough Rapid Transit Company, the New York Railways, the Third Avenue Railway and the New York & Queens County Railway have also decided to insure their employees themselves, while the International Railways, of Buffalo, has accepted insurance in the State fund. Of the three methods provided to insure the payment of the compensation fixed by law, it cannot be said that the third, insurance in a stock company, is making a winning appeal to electric railways. One reason for this may be the higher rates charged.

A comparison of the minimum base rates for stock and mutual companies in New York and near-by States shows that the New York rates are appreciably higher. The New York rate for these companies per $100 of payroll for urban or interurban railroad construction (with or without the installation of electric equipment or pole lines, and without blasting, tunneling or bridge building), is $4.37 as compared to $3.38 in Massachusetts and $2.70 in New Jersey. The rate for all urban electric railway operation in New York is $3.24, in Massachusetts $2.20 and in New Jersey $2. For interurban operation the New York rate exceeds that in Massachusetts, but is less than that in New Jersey, the rates being as follows: New York, $5.18; Massachusetts, $5, and New Jersey, $9.37. Subway construction rates (open cut or cut and cover or tunneling) are $13.28 for New York; $7.50 for Massachusetts, and $11.50 for New Jersey. The rates for elevated railway operation, however, are only $3.24 in New York, as compared to $3.50 in Massachusetts and $5 in New Jersey. It is stated that the New York rates are based as far as possible upon actual experience gathered from Massachusetts and other States already operating under workmen's compensation laws and that adjustments have been made only to conform to the increased benefits provided under the New York law.

The base rates quoted above may be reduced for merit rating. To employers who pay attention to accident prevention, whose plants have been inspected, and who will show a favorable record of accident experience, a reduction will be allowed to the extent of 40 per cent, depending upon the physical conditions in the manufacturer's establishment and upon his record of accident experience. This maximum allowance is four times as great as the employers in Massachusetts receive, and it is asserted by the State insurance department that the attainment of this maximum reduction would produce relatively a lower cost for compensation insurance in New York than in Massachusetts.

The State fund rates were originally fixed on a basis of a reduction of 8.39 per cent below the above quoted minimum rates for the stock and mutual companies, but already the compensation commission has authorized an investigation by its actuarial department to report prior to Aug. 1 on a compilation of base rates as much lower than the stock company rates as is consistent with the maintenance of a solvent insurance fund. Estimates as to this reduction run as high as 15 per cent, which would mean that the stock companies' minimum rates would be at least 23 per cent above the equitable rates for compensation risk. Whatever reduction materializes from this investigation, however, it must be granted that it is perfectly feasible for the State to give lower rates than do the stock companies, for the latter must pay solicitors' fees and stockholders' dividends. Under the State fund no such expenses exist, and during its operation for the first two and one-half years the cost is to be met out of the State treasury. Another attraction that the State fund possesses as compared to insurance in a stock company is that the former provides by law an absolute release from liability for the payment of compensation after the premium is paid, whereas employers insuring in a stock company are liable for the continuance of the compensation payment in case of bankruptcy.

Insurance in the State fund and self-insurance are not susceptible of such concrete comparison as given above, but the action of the Brooklyn Rapid Transit Company and the Interborough Rapid Transit Company is mute evidence of the belief that self-insurance in the end may be cheaper than insurance in the State fund for companies with a large organization and extensive resources. For years these companies have been paying compensation to their employees where no liability existed as a part of their welfare work. Then, too, in order to investigate passenger injuries and claims they have developed departments that can with ease and with little additional clerical expense handle the compensation work. The only difference lies in the State fund's provision for medical attention, but the high standard of the Brooklyn Rapid Transit medical inspection bureau and the thorough provisions recently adopted by the Interborough Rapid Transit Company for the medical care of its employees make it doubtful whether the employees would be better cared for under medical attention provided by the State.

One of the most difficult problems, and one that formerly caused great diversity of opinion in regard to self-insurance, is that of providing the proper payments to employees in the event of the bankruptcy of the employer. The fact that compensation payments may extend over a long series of years makes this point of vital concern to the employee and to his family. Ample provision for this point, however, seems to be made in the New York State law. Self-insurers must prove to the compensation commission that they are financially responsible and must file with the commission, to insure faithful discharge of any liabilities, high-class securities in an amount equal to the semi-annual premium in the State fund, less 10 per cent. This latter amount must be deposited in cash with the commission for use in the case of any immediate call for compensation payments. In the case of any death resulting in compensation payments, self-insurers must deposit immediately the full amount estimated to cover the risk involved to maturity. In some cases this might require a lump sum deposit of from $15,000 to $20,000.

The compensation commission recently made an interesting announcement to the effect that if electric railways should come into the State fund they would be put in a group by themselves in order to derive the benefit from their own experience and not have their rates loaded with the risks of more hazardous occupations insured in the State fund. For a group of companies having 3000 employees and a payroll of $3,000,000, this is probably the most satisfactory method of insurance under the new law.

"PROCEED, PROTECTED BY FLAG"—A FALLACY?

The numerous installations of automatic block signals by electric railways during the past year have resulted in focusing the attention of many operating men upon the matter of rules for operation under signals. In many cases, apparently, this attention has failed to disclose the fact that the old rule permitting a train to "proceed, protected by flag" has been eliminated from the standard interurban code. As a consequence of this oversight several roads have adopted block-signal rules, which, at least by implication, concede the right of trains to proceed in this manner.

The process of proceeding, "protected by flag," applies, of course, only to cases where trains on single track roads are unable to get into communication with the dispatcher, and under such circumstances the trainman is placed upon the horns of a dilemma from which he must be rescued by definite advice in the book of rules. In the standard interurban code prior to 1911 the matter was covered by old rules 203 and 203a whereby a train could proceed under control within one-half the range of vision on straight track, the conductor walking ahead at all curves "at a sufficient distance to fully protect his train."

However, at the 1911 convention this rule was eliminated as not being good practice, the record appearing on pages 106, 107 and 217 of the *Proceedings* of that year of the Transportation & Traffic Association. In consequence, under the present rules for movement by train order, when a train is held for any abnormal condition and cannot get into communication with the dispatcher, it can proceed only on time-table rights, which may be acquired by running as a second section behind the next regular train in the same direction.

This procedure is outlined in rule 166 of the present standard code. Obviously it may involve a wait of two hours in case an opposing regular train fails to make a meeting point, because no regular train loses its rights until two hours late. Nevertheless, this possible delay has been considered to be less objectionable than the risk of trusting trainmen to keep a safe distance behind a walking man as called for when proceeding, "protected by flag."

That the presence of automatic block signals should make permissible the return to a procedure that has been declared to be bad practice is hardly a reasonable assumption, and it is to be hoped, if only for the sake of uniformity, that those electric railways which have embodied in their signal codes the flagging rule for opposing movements will remove it. But little is gained by its presence among block signal rules, because it is seldom indeed that any catastrophe can shut down the telephone and not also affect the signals, thus making necessary the operation of the road by timecard only.

In block-signalled territory there are, of course, two general conditions which invite the application of the flagging rule. One of these exists when a signal in stop position holds a train for a period in excess of that required to run through the block in advance. This naturally constitutes strong evidence that the signal is out of order, but that does not justify the train in blindly entering the block without word from the dispatcher, because it is possible for a high-speed opposing train to enter the block without warning at any time before the entry of the first-mentioned train has set the signal at the opposite end of the block. On the other hand, it is obvious that if the train waits in the clear until the arrival of a train in the opposite direction, or else until a trainman has gone to the nearest operative telephone, which in signalled territory will seldom be more than a mile away, the difficulty will be solved without the slightest risk being run.

The only other general reason for using the flagging rule would occur when the whole telephone line was down and a train was working its way over the road with the aid of the signals, the "range of vision," as cited in the old rule, being ample and the signals uniformly showing clear indications. With this phase of the question, however, there enters the matter of signal reliability, and too many incidental problems affect it to permit of its consideration at this time. However, it may be said that the belief of the block-signal committee seems to incline at present toward the use of single-track signals only as a safeguard superimposed upon the structure of operating rules, and for this reason the importance of this argument in favor of the old flagging rule is considerably reduced.

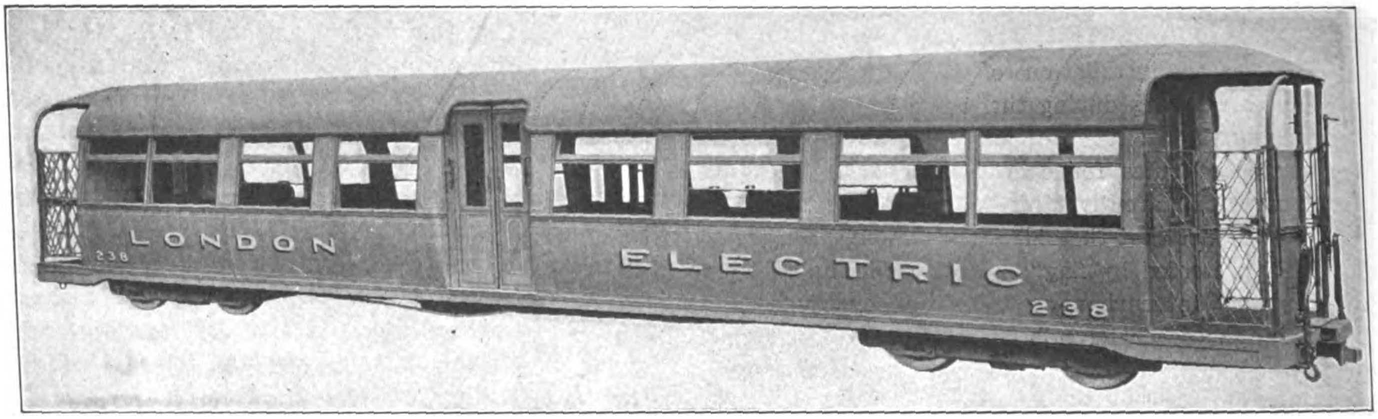
In any event the conditions cited are abnormal, and since normal operating conditions of the present time call for "safety first," the adoption of a block-signal rule that leaves a loophole for accident should be discountenanced by every operating man. The rules should state clearly and positively that a signal blade in stop position must not be passed except upon definite instructions from the dispatcher. This may involve complication in the case of intermediate signals when the telephone is out of order, but it will be safe operation and in accordance with good practice.

New Rapid Transit Cars for London

This Article Describes the Latest All-Steel Cars for the Metropolitan District Railway and the New Center-Entrance Cars for the Tube Service of the London Electric Railway

In the ELECTRIC RAILWAY JOURNAL for Feb. 7, 1914, some particulars were printed of recent improvements in rolling stock undertaken by the Metropolitan District Railway and the London Electric Railway, of which Sir Albert Stanley is managing director and W. A. Agnew mechanical engineer. That article stated that the latest District cars were built up of steel underframes, fireproofed wood and aluminum fittings; also that tests were being made with two tube cars which had been fitted with different types of center doors to provide more facilities for passenger interchange than the original single-platform design afforded. The tube motor cars really have two platforms, but the front end is not available for passengers owing to the installation of the contactor equipment above the floor line and behind the control cab.

Since the foregoing article was published the management ordered thirty all-steel cars for the Metropolitan District Railway and fourteen center-entrance cars for the Bakerloo tube extension to Paddington station. A description of each type follows:



LONDON UNDERGROUND CARS—COMPLETED CENTER-ENTRANCE STEEL CAR FOR TUBE LINES

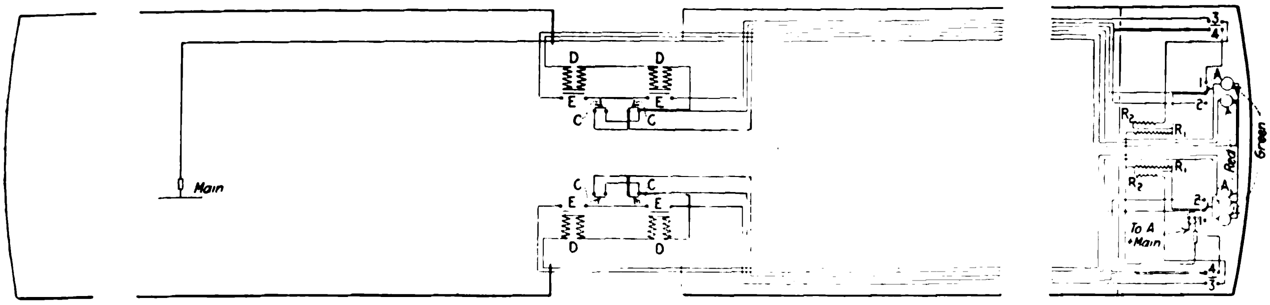
ALL-STEEL CARS FOR METROPOLITAN DISTRICT RAILWAY

The new cars of the Metropolitan District Railway follow the same seating and door arrangement as the car illustrated on page 299 in the issue of Feb. 7, 1914, namely, in the use of sliding doors at each platform and in the center. The main dimensions, which are also substantially the same, are as follows: Length over all, 49 ft.; distance between the truck centers, 34 ft. 1 in.; width over the framing, 8 ft. 8 in., and height from rail to top of carlin, 11 ft. 11½ in. As shown in the accompanying half-tone and drawings, commercial steel sections are used for the framing throughout except that ash serves as a filler where indicated. The end sills are 8 in. x 3 in. x ⅜ in. channels, the sill at the motor end being of pressed steel. The cross-sills and center longitudinal sills are of 6-in. x 3-in. x ¼-in. I-section. Since the windows are more than 4 ft. wide it was not feasible to make the 1½-in. x 1½-in. x ¼-in. angle carlins integral with the side posts. Each post is built up of a pair of reversed angles with short struts between. The diagonal members between the bottom side sill and belt rail are angles 1½ in. x 1½ in. x ¾ in., while the diagonals which brace the 3-in. x 1¾-in x 3/16-in. pressed-steel corner posts are channels 2 in. x 1 in. x 3/16 in. The floor is of ¾-in. "Sanit" composition on 3/16-in. flat steel plate. The interior fittings of the car are of polished aluminum alloy, and the advertisement and other moldings of pressed steel. The aluminum fittings were furnished by the British Aluminium Company, London.

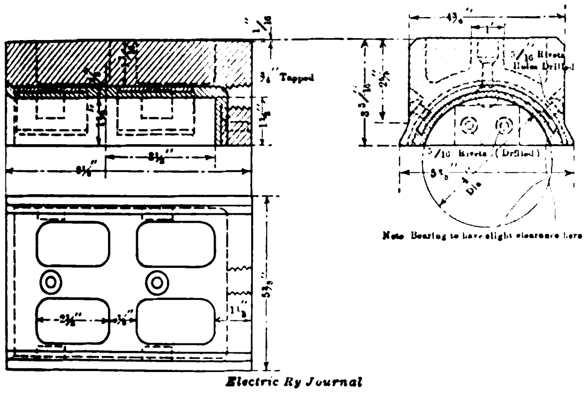
The interior lighting is also of modern type, consisting of obscured bowl fittings in the roof and bracket lights over the cross-seats. The sides, doors and roofs are of steel panels of the thicknesses shown on the drawings. The roof is covered with 16-oz. cotton duck.

The monitor roof has been abandoned in favor of the single-arch design principally to secure better workmanship in steel construction than would have been possible with a monitor roof. This change, however, has not decreased the total weight of the car, as the company preferred to increase the sizes of certain members over those of earlier cars. Ventilation is secured by the use of seven Acme ventilators, in addition to which small movable sashes are provided over the large windows. The entire floor area of 320 sq. ft. is available for passengers except that on the leading car a space of 3 ft. depth x 8 ft. width is reserved for the motorman. This means that on a standard District eight-car train of four motor-cars and four trailers 99 per cent of the total area is available for the accommodation of passengers. The vestibule side doors have a free opening of 2 ft., while the double doors at the center of the car have an opening of 3 ft. 5¾ in. between the glass partitions inside the car, but part of this space is required for the installation of mahogany hand rails. The seating is a combination of cross and longitudinal seats, the former accommodating sixteen and the latter thirty-two passengers. Folding seats are provided for both the conductor and the motorman. The width between the aisles of the 38-in. cross-seats is 19 3/8 in., and between the longitudinal aisles 46 in. The use of pressed steel for the seat legs is in accordance with the company's practice for several years past. The seats are covered with moquette velvet, which passengers prefer to rattan. This velvet is kept clean by brushing it with a special solution related to tetrachloride of carbon, and by vacuum cleaning.

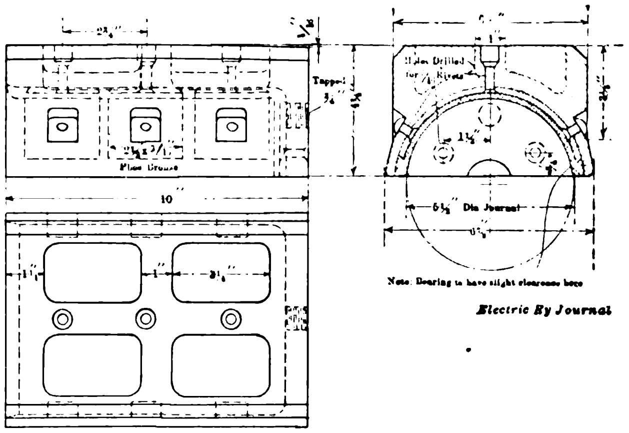
With regard to the trucks, the company had in its original stock motor trucks of the cast-steel Hedley type and trailer trucks of the equalizing type, but the severe service gave a good deal of trouble owing to fractures in various parts, and the riding did not prove all that



LONDON UNDERGROUND CARS—DIAGRAM OF ELECTRIC LOCK OPERATING MECHANISM FOR DOORS



LONDON UNDERGROUND CARS—JOURNAL BOX BEARINGS ON TRAILING AXLE



LONDON UNDERGROUND CARS—JOURNAL BOX BEARINGS ON DRIVING AXLE

was desirable. The trucks now used have been tried out for four years and, beyond a few troubles which have been overcome, have shown themselves decidedly more economical to maintain and more comfortable in running than the old type. The weight of the new pressed-steel motor truck of 7-ft. 3-in. wheelbase is approximately 12,400 lb. complete with wheels and axles, as compared with the old 6-ft. 6-in. motor truck of 11,300 lb. The new pressed-steel trailer truck of 7-ft. wheelbase complete with wheels and axles weighs approximately 8000 lb., as compared with 7500 lb. for the old trailer trucks of 5-ft. wheelbase. The increase in wheelbase was made to get inside brakeshoes and to reduce the wear on the track.

The new motor truck has a width of 6 ft. 1 in. over end bars, a length of 11 ft. 4 in. over the end bars, and wheels of 36-in. diameter. The trailer truck has a width of 6¼ ft. over the end bars, a length of 11 ft. 2½ in. over end bars, and wheels of 30-in. diameter. Unlike American motor and trailer trucks the springs under the bolster are spiral instead of elliptical, while the springs at the journal boxes are elliptical instead of spiral. On both trucks an anti-vibration packing 1 in. thick is placed between the underside of the bottom spring seat and the top of the spring plank. The journal boxes are of cast steel. Both the motor and journal which are illustrated are combined with the thrust block. This block is of cast steel and is lined with white metal on phosphor bronze strips which serve to key the metal and also to prevent the swaying of the axle if the bearing metal should run out.

The motor truck carries two 230-hp GE-212 commutating-pole motors with a gear ratio of 3.37. The control is Type M. The air-brake equipment includes a CP-30 compressor on each motor car. The weight of each motor is 6100 lb., or 26.5 lb. per rated horse-power. The weight of the motor car complete is 76,160 lb., of the motor truck complete 24,640 lb., of the trailer truck complete 7840 lb., of the motor-car body complete and equipped 43,680 lb. The horse-power per ton (of 2000 lb.) of train is 7.36. The total floor area, as previously noted, is 320 sq. ft., and this figure corresponds to 11.5 sq. ft. per long ton for a motor and trailer car combined, 9.4 sq. ft. for the motor car only and 14.7 sq. ft.

for the trailer only. The weight per seated passenger is 1280 lb. for motor car and trailer car combined.

The District cars and trucks were built by the Gloucester Carriage & Wagon Company, Ltd., to the designs of the mechanical engineer of the railway company.

LONDON ELECTRIC RAILWAY CARS

The new motor cars of the London Electric Railway are also of steel construction. The framework is built up of commercial sections with the exception of the fish-belly side girders. The end sill at the trailer end is a 4-in. x 4-in. x ½-in. angle while that at the end sill at the motor end is a special steel pressing. The center longitudinal sills and cross-bars are 4-in. x 2-in. channels weighing 8 lb. per foot. The side posts are 2½-in. x 2 in. x 3/16 in. angles, and the carlins 1½-in. x 1½-in. x 3/16-in. angles. There are no diagonal braces in the side framing, the side plating being sufficient. At the center entrance the framing is reinforced by a fish-belly plate ¼ in. thick and 12 in. maximum depth with a second 4-in. x 4-in. angle. The panels are of ⅛-in. steel plate. Ventilators of an unusual cast-grid type to the number of six are set flush in the ceiling practically over the seats. These lead into an air duct which is open to the atmosphere at each end of the car, the ends being protected by hoods.

It will be observed from the accompanying plan and elevations, that the doors at the control end are for the use of the motorman only. A distance of approximately 11 ft. for the full width of the car is required for the control equipment because the limited clearance in the Bakerloo, Piccadilly and Hampstead tubes does not permit this apparatus to be placed under the car floor. In fact, the over-all height of the car above the rails is only 9 ft. 5¼ in. The control end of the car is mounted on a truck of 6-ft. 6-in. wheelbase supplied with wheels of 36-in. diameter. The trailer truck is of 5-ft. wheelbase and has wheels of 30-in. diameter. The trailer end of the platform is fitted with swinging gates.

The novel feature of this car is the center-door arrangement. The doorway itself is 6 ft. 2 in. high and is equipped with two passenger-operated doors which are pushed inward to give a clearance of 3 ft. 10 in. at the threshold. These hinged doors are self-closing and are supplied with electrically controlled locks. Small signal lamps are installed at the conductor's station to indicate when the doors are closed and locked. These are the first European cars in which light signals have been used for such a purpose.

The electric lock-operating mechanism consists of resistances *R*1 and *R*2, a double-throw switch *A* operated by hand, a double-throw switch *B* operated by the end gates of the car, door contact *C*, and latch-lifting magnets *D*, which also operate contact *E*. For normal operation the switch *A* is closed on contact No. 1. When the end gates and middle doors are closed switch *B* is on contact No. 3. Current then flows through *R*1, *R*2, *R*3, *E* to the green lamp, which indicates to the conductor that the middle doors are closed and locked.

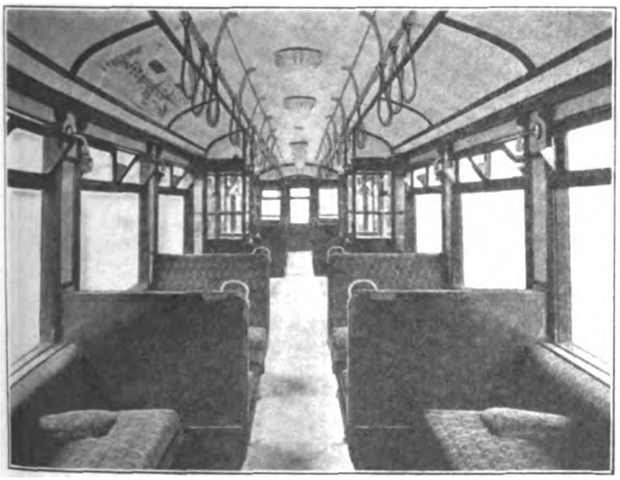
LONDON UNDERGROUND CARS—ELEVATIONS AND PLAN OF CARS FOR METROPOLITAN DISTRICT LINE

When the gates are opened the switch *B* makes contact at *B*4, and the current flows through *B*1, *A*1, *B*4, coils *D* to the red lamp, unlocking the middle doors. If the middle doors are now opened, a circuit is closed through contacts *C*. If the conductor now closes the end gates the current flows through *A*, *C*, *D* to the red lamp, so that this remains alight, indicating that the middle doors are open. When the middle doors close contacts *C* are lifted, opening the circuit through the coils *D*, the latches fall and the circuit is closed again through *E*, lighting the green lamp. If it is desired to open the middle doors without opening the end gate, switch *A* is placed on contact No. 2. To open the end gate without unlocking the middle doors switch *A* is placed in the "off" position. The resistance of *R*1 is 1600 ohms. The resistance of *R*2 is equal to that of the lifting coils, which is 800 ohms.

Each motor car is fitted with two GE-212 motors and Type M control. The motor trucks are similar in construction to those used on the Metropolitan District Railway. The trailer trucks are of special design on account of the low car body, the floor of which is only 22 in. above the rail. The seating arrangement consists of sixteen cross-seats and twenty side-seats. As in the District cars, the side-seats are divided by barriers to form seats for individual passengers. The transverse seats are 38 in. wide, the aisles between the seats are 20 in. wide and between the longitudinal seats 39 in. wide. The cars were built by the Brush Electrical Engineering Company, Loughborough, to the designs of Mr. Agnew.



LONDON UNDERGROUND CARS—INTERIOR OF NEW METROPOLITAN CARS, SHOWING IMPROVED LIGHTING

The floor spaces and weights of these cars are as follows:

Length over end sills	50 ft. 0½ in.	
Centers of trucks	33 ft. 10 in.	
Area of passenger compartment	256 sq. ft.	
Number of seats	36	
Weight of car body without equipment	29,500 lb.	
Weight of equipment in body	4,500 lb.	
Total weight of body and equipment		34,000 lb.
Weight of motor truck without equipment	12,200 lb.	
Weight of motor truck completely equipped		24,500 lb.
Weight of trailer truck complete		6,500 lb.
Total weight of car		65,000 lb.

The accompanying half-tone of the car marked "London Electric" is that of a trailer car, but it will serve to show the general form of the motor car described. The main difference in the outside appearance is that the control section is fitted with louvered openings instead of windows.

Separation of Freight and Passenger Operating Expenses Ordered

The Interstate Commerce Commission, on June 13, handed down a decision requiring railway companies in Class I, or those having annual revenues of $1,000,000 and over, to separate their operating expenses between freight and passenger service as outlined in statistical series circular No. 3. This circular will be revised, and if sufficient progress can be made the carriers will be asked to file a special report for the year ending June 30, 1915.

In its decision the commission reviews the history of this plan. Prior to 1894 such a separation was required, but it was discontinued because the railroads claimed that in only a few expenses was an accurate separation possible. The commission believes that during the past twenty years railway accounting and accounting generally have developed so that a reconsideration of the matter seems warranted. The commission then cites the railroads which are now following the plan. They include approximately half the mileage of the large carriers in the United States. The officials of these roads say that they have made this voluntary separation to secure efficiency and not for rate-making purposes, and that, when conducted on this basis, it is not so important that the arbitraries used are exactly correct or not. The commission states that it is not interested in statistics of this character merely for the purposes of rate making. The statistics would be valuable for making comparisons, and it is the duty of the commission to keep itself informed in regard to the manner in which the railway business is conducted and to have a knowledge of variations in unit costs.

It was urged that if the commission really needed this information a special study should be undertaken at any time for the individual case considered, but the commission thinks that while such special study would be necessary it cannot take the place of general statistics systematically compiled year after year. It was also suggested that the commission should wait until the courts had rendered decisions in certain pending rate cases before making this requirement, but the commission thinks it is justified in making the order because the courts have a right to look to the commission for careful study of railway statistics and accounts.

Another argument urged against the plan was the possible misuse of the information collected. It was urged that to give cost accounting information to the public would be the same as giving dangerous instruments to children. The commission believes, however, that a systematic development of the subject and its free discussion is the best safeguard against the misuse of cost figures. Commissions and legislators are not intentionally unfair, and if any of them have enforced unjust rates, statistics of the kind contemplated might have convinced them that some other schedule would have been more just.

Another argument against the adoption of the plan was its expense. On this point the commission says that the carriers were asked to submit estimates of this expense, and the estimates varied from $78.29 per mile for the Lackawanna to $3.17 per mile for the Southern Pacific. The commission believes that if expense alone were to be the determining factor, a new estimate will have to be made after its revised circular has been published.

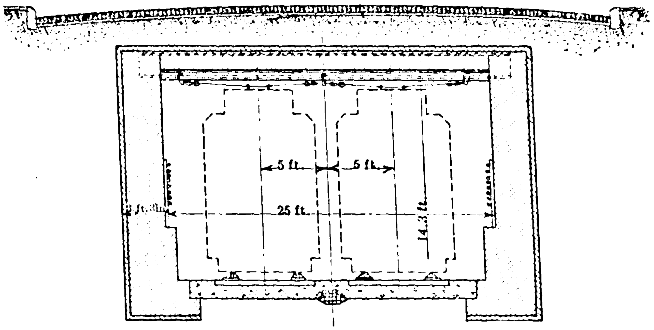
The commission concludes its report by saying that in the light of all the suggestions received a workable plan will be developed which it believes will not be unduly prejudicial to the carriers.

Subway Development at Buenos Ayres

The System Is Remarkable for the Use of 1100-Volts Direct Current, and the Operation of the Same Cars for Subway and Street Operation

In a recent issue of the *Elektrotechnische Zeitschrift* E. E. Wachsmann presents some interesting particulars on the subway lines of Buenos Ayres. The population of Buenos Ayres, in 1913, was 1,457,885, and in the same year the number of passengers carried by the street railway system was 407,252,140, before real rapid transit was inaugurated. The system now in service covers 10 miles and is operated by the Compañia de Tranvias Anglo-Argentine, Ltd. The franchise was obtained Dec. 28, 1909, and construction was begun almost immediately.

The franchise covers three routes as follows:



5 ft.
5 ft.
3 ft. 3 in.
25 ft.
14.3 ft.

BUENOS AYRES SUBWAY—PLAN SHOWING ROUTE OF PRESENT LINE AND FUTURE ROUTES

Line 1.—Plaza Mayo through the Avenida de Mayo to the Plaza Congreso-Plaza Once, with a later extension to Plaza Primera-Junta (Caballito), 4.34 miles, known as the Mayo-Once-Caballito line.

Line 2.—At right angles to the former and running from Constitucione to Retiro, about 2.79 miles long.

Line 3.—Plaza Mayo in a northwesterly direction to Plaza Italia, about 4.03 miles long.

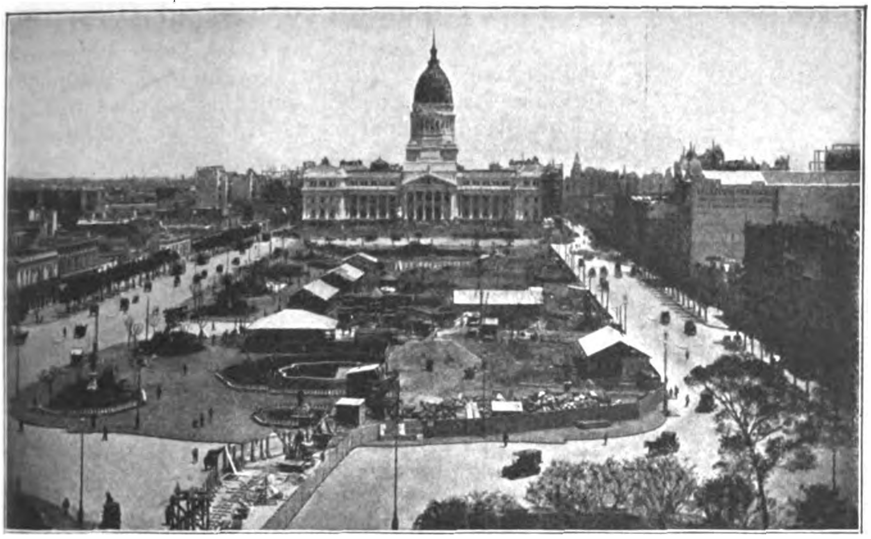
The present installation is double-track throughout, with nine stations, spaced about 1300 ft. apart. The average grade does not exceed 0.5 per cent. The greatest distance between the head of the rails and the surface of the street overhead is 26 ft. and the least is 16 ft. As the accompanying map shows, there are very few curves.

CONSTRUCTION OF TUNNEL

The clear height of the tunnel between the head of the rails and the roof is 14.3 ft. and the clear width 25 ft. No columns divide the tracks. The tunnel roof is usually built up of brick and steel, reinforced concrete being used only at the four-track section near Plaza Once station. Tar paper and asphalt are employed for weatherproofing. Ventilating shafts of 32 sq. ft. opening are installed about 525 ft. apart. Translucent roof coverings are also used wherever possible, so that the subway has many daylight sections. Work on the subway was begun in November, 1911, and ended twenty months afterward. The cost of construction was $7,087,500. The excavation amounted to 527,000 cu. yd. The masonry amounted to 77,500 cu. yd., using 31,000,000 brick and 108,000 bbl. of Portland cement, weighing 374 lb. each. Other quantities were 13,000 tons of columns and 96,840 sq. ft. of waterproofing.

TRACK, LINE AND STATIONS

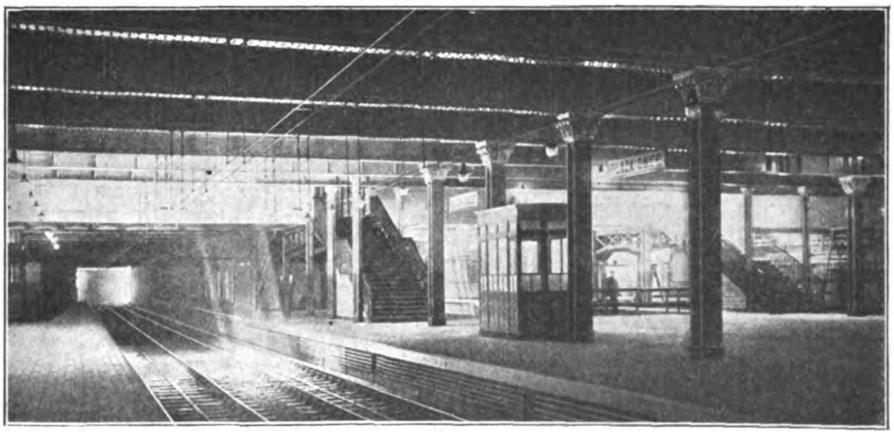
The track consists of 87.5 lb. rails placed on wooden ties. The stations are generally 328 ft. in length, which is enough for six-car trains. They are entered from the sidewalk by two stairways, each having an archway with an illuminated destination sign. A different color scheme is used for each station. At the most important station, Plaza Once, there are six tracks, the four outer ones being used for the subway service and the two middle tracks for interchange of passengers with the Western Railway. Power is purchased from the central station of the Deutsch-Überseeischen Electricitäts-Gesellschaft via four substations. The distribution system includes 550 volts for the surface lines and 220 volts for lighting. In view of the forthcoming operation over surface railway extensions, current collection in the subway is by means of two 1100-volt



BUENOS AYRES SUBWAY—PLAZA CONGRESO, A NOTABLE CENTER OF BUENOS AYRES. EXCAVATION WORK APPEARS IN THE FOREGROUND

100 sq. mm. (about No. 0000) grooved wires per track. Pantograph collectors are used. Of course, overhead current collection meant the high headroom already referred to, but the greater clearances will conduce to a cooler subway. Furthermore, ground water is not a disturbing factor.

The selection of the signal system was of particular importance owing to the intention to operate trains on only 1½-minute headway. The installation is of the semi-automatic type, similar to that used on the Hamburg Rapid Transit System. The indications are visual and are displayed only in the direction of running. The signal attendant also has charge of the switches, which are electrically operated with current from storage batteries. It is proposed to use straight automatic signals on the sections of this line next to be constructed. Every station has a large illuminated clock which is operated electrically from the central office of the company.



BUENOS AYRES SUBWAY—PLAZA ONCE STATION, WHERE PASSENGERS ARE INTERCHANGED BETWEEN SUBWAY AND STEAM RAILROAD

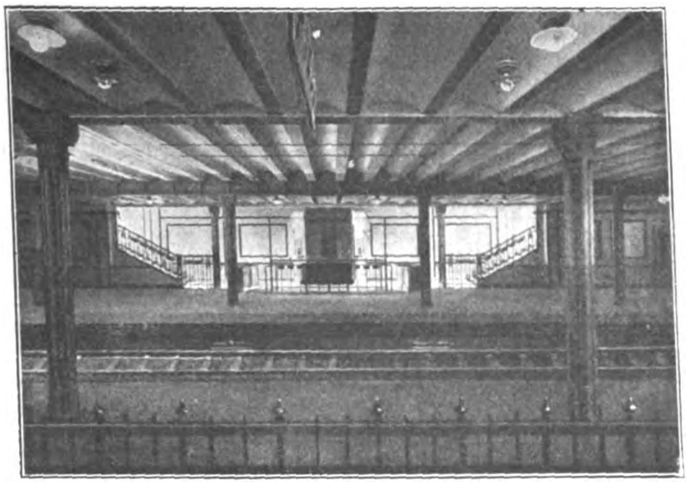
Rolling Stock

The cars are unusual in having end-drop platforms for street railway service and flush-floor side entrances for subway service. They are 52 ft. long, weigh 30 metric tons, and have twenty-four longitudinal and sixteen cross-seats upholstered in leather. The two doors on each side of the cars have a clear opening of 48 in. These doors are locked when the car operates on surface track; contrariwise, the doors on the end platforms are closed when the car is operated in the subway. Each car is equipped with two 115-hp. A.E.G. motors, operated at 560 r.p.m. The driving wheels have a diameter of 36 in. The rate of acceleration is 1.33 m.p.h.p.s. On the surface sections the control current is taken direct from the trolley, but on the tunnel sections it is secured at 500 volts from a motor-generator set. Air is provided for Knorr brakes, sanders and current collectors. Thus far fifty motor cars are in service. They are maintained at a shop with three bays, one for general machine work and two for 100 cars each. No trailers are used. The speed on the 1100-volt sections is 31 m.p.h.

BUENOS AYRES SUBWAY—AVENIDA DE MAYO, SHOWING SUBWAY ENTRANCE

Operation and Service

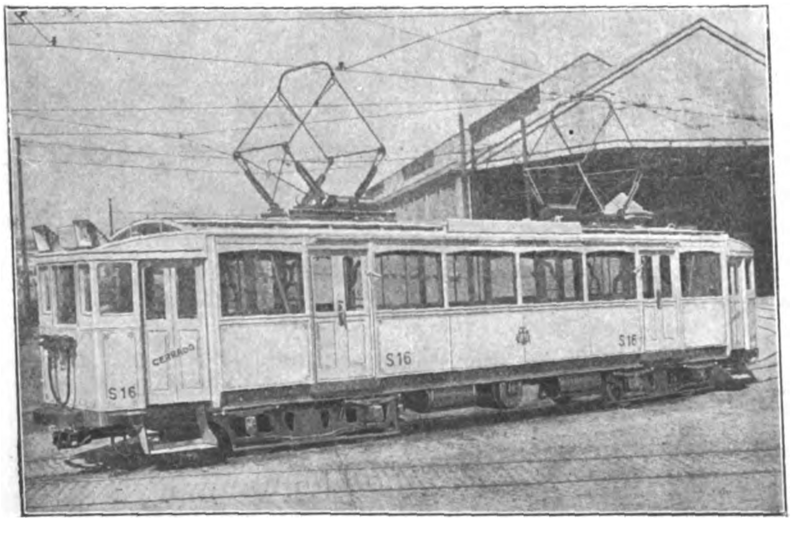
Until the line is extended to Cabalito, and previous to the electrification of the Western Railway's underground lines, the service between Plaza Mayo and Plaza Once will be with two to four-car trains at intervals of three to five minutes. When the line is extended to Caballito the trains will be broken up at Plaza Once into single cars for surface operation beyond that point. On return the cars will be coupled again into trains. The maximum length of the train is six cars.



BUENOS AYRES SUBWAY—SHOWING SIDE VIEW OF A TYPICAL STATION

This means that with a headway of 1½ minutes 16,800 persons can be carried in each direction per hour. The scheduled speed is 12.4 m.p.h., so that the trip between the present terminals can be made in 10 minutes and to Cabillito is 18 minutes. The average stopping time per station is 20 seconds. On the Mayo-Once section stations are about 1400 ft. apart, whereas on the outer or Once-Caballito section they are about 2600 ft. apart.

A unit fare of 10 centavos (Argentine silver) is charged for subway riding plus 5 centavos for a continuation of the ride on surface lines. The city receives 6 per cent of the gross earnings. The company's franchise is for eighty years. Tickets may be bought at the stations from automatic machines, which print the price, the date, the hour, the serial number and station. Service is given from 5 a. m. to 1 a. m. In 1913, 4,080,000 passengers were carried per mile of single track.



BUENOS AYRES SUBWAY—STANDARD MOTOR CAR WITH DOOR AND STEP SYSTEM FOR BOTH SUBWAY AND SURFACE OPERATION

Acknowledgment is due the Allegemeine Company for its courtesy in permitting the use of the halftones which illustrate this article.

The London, Brighton & South Coast Railway has sent about forty of its men, drawn from all ranks, on a visit to Germany to witness the latest electrical developments in that country and incidentally to inspect the Berlin works of the Allgemeine Company which is supplying a large part of the electrical equipment for the suburban lines of this railway.

A Labor Paper on Municipal Ownership

In its issue of July 18, the *Union Labor Advocate*, of Washington, D. C., the official organ of the Washington Building Trades Council, which is affiliated with the building trades department, American Federation of Labor, prints the result of an investigation which it has made of the municipal electric railways in the far western Canadian cities. Of municipal ownership of these railways it says in part:

"Municipal ownership, particularly of street railways, has been absolutely discredited in the house of its friends.

"Members of labor living in cities operating municipally owned street railways have come forward with testimony and evidence proving the abject failure of municipal ownership.

"The *Union Labor Advocate*" this week has received letters from the members of the three typographical unions in Edmonton, Lethbridge and Saskatoon, Canada, telling of the experience with municipally owned and operated street cars in those cities and showing varying degrees of failure in all.

" 'Although the news might be disappointing to you, I must give an unbiased, unpolitical opinion on such a question as municipal ownership—it is an utter failure in Edmonton,' writes J. Hanning, secretary of the Typographical Union of that city, on learning that municipal ownership of the street railways of the American capital is proposed and advocated by some union men.

" 'Our street cars have undoubtedly not been a success. I am no longer a believer in municipal ownership,' writes Secretary J. J. Jones, of Lethbridge.

"In Saskatoon, where the municipally owned street railway is only a year old, Secretary R. J. Moore still believes in municipal ownership, though he says that the railway has not been a success financially and tells of popular distrust in the management and dissatisfaction with the service."

The *Union Labor Advocate* then publishes the letters in question. That from Edmonton is printed complete below:

"Your letter dated June 26 has received my careful consideration, and although the news might be disappointing to you I must give an unbiased, unpolitical opinion on such a question as municipal ownership—it is an utter failure in Edmonton. The street car system is the poorest of five cities I have lived in—Toronto, Vancouver, Portland, Winnipeg and Edmonton—and the fares are equal to the highest—straight 5 cents.

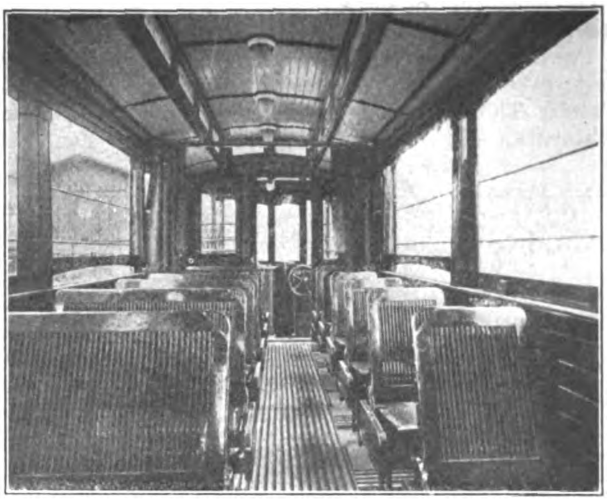
"The reason for the failure of municipal ownership to compete or even compare with private ownership in this city is because the spoils system entirely eliminates all chances of getting competent men to run it. Every year the administration changes and with it the entire staff goes too. Always incompetent men are given the jobs, their ability lying in their power to get votes. We have the real estate alderman who makes it his business to use his influence to get a stub line built at the city's expense to a subdivision in the woods for the purpose of selling town lots and incidentally piling on the expenses of the corporation (city) by running empty cars to unpopulated districts.

"It is true they have lost $400,000 since its inception and it looks as though they will lose more. The city owns the electric light system and sells the street car service power at 2 cents per kw-hr., robbing Paul to pay Peter. Residents pay as much as 8 cents per kw-hr."

Electric Railway at Constantinople

Constantinople, the last stronghold of Turkey in Europe, now has an electric railway service, the present routes of which are shown in the accompanying map. The first section, which was opened in August, 1913, is in the Pera district. The service has proved enormously popular, 20,000 people a day being handled at the Pera station where passengers transfer from a cable line between Galata and Pera. The system is of meter gage and generally is double tracked. The lengths of the present routes total 18.6 miles of single track. Extensions which would bring the total length of the system to 31 miles of single track are now under consideration. One of the most beneficial accompaniments of the electrification has been the leveling and widening of many narrow streets.

The power plant at Siligthar contains three 6000-hp Brünner turbo-generators, which furnish three-phase current at 9600 volts and fifty cycles. The transmission system has three substations, namely, Bayazid, Galata and Taxim. Each substation contains a 400-kw 600-volt rotary converter. Both the high-tension and low-tension feeders are carried in underground cables. The overhead construction is of the ordinary side-pole type because the construction of the houses did not permit the use of rosettes despite the narrowness of the streets. The poles also carry arc lamps and two sets of telephone wires. On Pera Street, however, the telephone wires are carried underground. Every pole is topped by an ornament made up of a fez and Turkish crescent.



CONSTANTINOPLE ELECTRIC RAILWAY—INTERIOR OF CAR, SHOWING CURTAIN FOR HAREM SECTION

The present rolling stock consists of forty first-class motor cars, seventy second-class motor cars and fifty trailers. Another fifty motor cars are now on order. Each car seats eighteen passengers on reversible cross seats, the narrowness of the car permitting only a single-passenger seat on one side of the aisle. Not more than three standees are permitted inside the car, but seven are allowed on each platform. A feature peculiar to Mohammedan practice is the use of a hanging curtain to screen off one part of the car to form a harem section. This curtain may be shifted according to the number of women in the car.

The trucks of these cars have a wheelbase of about 7 ft. to permit them to operate over curves of 49 ft. The equipment per car includes two Siemens-Schuckert D-58 commutating pole motors which are rated at 40 hp at 420 r.p.m. The maximum speed for motor cars on level track is 15.5 m.p.h. The controllers have nine running and six braking positions. Ordinary braking is done by hand, the electric brake being used only for emergencies. In addition a magnetic track brake is used on grades. Only the first-class cars have electric heaters. Of the three carhouses, that at Chichly is combined with the repair shops, stores and

CONSTANTINOPLE ELECTRIC RAILWAY—MAP OF STREET RAILWAY SYSTEM

Maximum Length of Profitable Ride in Boston

In connection with a report upon transportation conditions within the Boston metropolitan district submitted to the last Legislature, the Massachusetts Public Service and Boston Transit Commissions, sitting as a joint board, filed an appendix discussing the maximum length of profitable ride on the Boston Elevated Railway system. The board recognizes that the determination of this question does not admit a general answer, being dependent upon certain assumptions, but it works out the case for Boston on the supposition that the average passenger rides two-thirds of the length of each half round trip. The appendix is abstracted below.

The capital of the Boston Elevated Railway (without the West End company) is $48,229,400; allowing 5 per cent as a fair rate of return on the stock and notes outstanding, and the actual bond interest paid, the total return on the capital is $2,496,784, or 5.18 per cent. If the capital included in the leased West End Street Railway is included, the total capital on which the company is responsible for a return is $86,383,550 (not including the Boston subways, whose rentals are deducted in the following tabulation, and a few small items). The total return upon this is $4,661,435, or an average of 5.40 per cent. The board states that in view of the fact that the capital of these companies has been issued under the approval of the former Railroad Commission and that the same board has in the past fixed the price at which Boston Elevated stock shall be issued at as high as $150 per share (par value $100) it cannot be urged with reason that this average rate of return is too high. If as small a sum as 1.6 per cent is allowed per annum for depreciation charges, the company should earn a total of 7 per cent on its capital; if the depreciation charge allowed is 2.6 per cent, the requisite return would be 8 per cent.

STUDY OF OPERATING DATA

Operating expenses, 1912-1913	$11,135,581.18
Taxes, 1912-1913	1,128,021.51
Interest on West End Street Railway funded debt	776,360.00
Interest on West End stock and other charges on leased property	1,468,819.15
Subway rentals	687,308.54
Total charges except return on Boston Elevated investment	$15,196,090.38
Total number of revenue passengers	326,352,863
Total number of passengers riding on each line, including revenue passengers and those who transfer from the line on which they pay fare to another line, either by check or free bodily transfer, estimating the transfer passengers as 0.6 of the revenue passengers	524,666,992
Total car miles run	57,504,571
Total number of half round trips	13,443,554
Average length of half round trip, in miles	4.28
If it is assumed (contrary to the facts) that every passenger rides the entire length of a half round trip, the total number of passenger miles becomes	2,245,574,726
As each passenger does not do this, it is assumed that two-thirds of each half round trip is the average length of ride, making the following estimated total passenger mileage	1,497,049,817

The actual cost per passenger mile then, excluding return on investment, depreciation and sinking fund charges, is

$$\frac{\$15{,}196{,}090}{1{,}497{,}049{,}817} = 1.01 \text{ cents}$$

If, then, the actual cost of carrying a passenger a mile, not allowing for return on investment, is 1.01 cents, it follows that if a passenger is carried $\frac{5}{1.01} = 4.95$ miles, his fare is entirely used for expenses, leaving no return on capital; in other words, a portion of each 5-cent fare must be reserved for return on capital, leaving only the remainder available for operating expenses and taxes.

Last year the capital of the Boston Elevated Railway received a total return of	$2,496,784
Other charges were	15,196,090
Total	$17,692,874

Every 5-cent fare was divided as follows:

$$\text{Return on capital } 5 \times \frac{2{,}496{,}784}{17{,}692{,}874} = 0.7 \text{ cent}$$

$$\text{Available for expenses and taxes } 5 \times \frac{15{,}196{,}090}{17{,}692{,}872} = 4.3 \text{ cents}$$

The maximum distance which the company could afford to carry a passenger for 5 cents, giving capital the return received last year is $\frac{4.03}{1.01} = 4.25$ miles.

If the total return on capital and for depreciation had been 7 per cent, the result would have been:

Return on capital and depreciation, 7 per cent on $48,229,400	$3,376,058
Expenses as above	15,196,090
Total	$18,572,148

In this case the proportion of the 5-cent fare available for expenses would be represented by the fraction $\frac{15{,}196{,}090}{18{,}572{,}148}$, giving as the return on capital, $5 \times \frac{3{,}376{,}058}{18{,}572{,}048} = 0.93$ cent.

$$\text{Available for expenses and taxes, } 5 \times \frac{15{,}196{,}090}{18{,}572{,}148} = 4.07 \text{ cents.}$$

Maximum length of profitable ride for 5 cents equals $\frac{4.07}{1.01} = 4.03$ miles.

In the same way, assuming that 8 per cent is a fair allowance for capital return and depreciation, we have:

Return on capital and depreciation, 8 per cent on $48,229,400	$3,858,352
Expenses as above	15,196,090
Total	$19,054,442

$$\text{Return on capital, } 5 \times \frac{3{,}858{,}352}{19{,}054{,}442} = 1.01 \text{ cents.}$$

$$\text{Expenses and taxes, } 5 \times \frac{15{,}196{,}090}{19{,}054{,}442} = 3.99 \text{ cents.}$$

Maximum length of profitable ride for 5 cents, $\frac{3.99}{1.01} = 3.95$ miles.

The commission considers these results very illuminating and points out that the only assumptions involved are the estimate of transfer passengers and that every passenger rides two-thirds of a half round trip. If less than six-tenths of the passengers transfer, the actual cost per passenger mile becomes greater than computed, from which it follows that the profitable ride would be less than 4.25 miles on the basis of the present return on capital. If every passenger also rides less than two-thirds of a half round trip, the profitable haul is also found to be less than 4.25 miles. The expense of operation is nearly constant, whether the passenger rides the entire length of a half round trip or only a fraction of that length, for wages and all other expenses except for the additional power necessary. The commission considers the estimate of 4.25 miles as the maximum profitable haul at Boston under present conditions "to be as close an approximation to the truth as can be deduced from the available statistics."

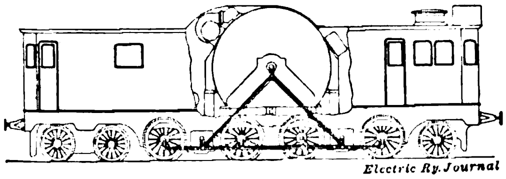
Drive and Equipment of Electric Locomotives*

BY F. LYDALL

Since the author's paper on "Driving Systems of Electric Locomotives" was completed, a few new designs have been developed and more experience has been gained. Two new designs are illustrated, being those brought out by the Bergmann Company for the Silesian Railways.

Type 2-D-1 of the Bergmann Company is shown in the first illustration, the special feature being the provision of two jack shafts coupled by inclined connecting rods to the armature shaft of the single motor. The obvious advantage of this design is that the torque produced by the one powerful motor is divided between two jack shafts. The locomotive is at present in course of construction.

Type 2-B + B-1 of the Bergmann Company is shown in the third illustration. The rating of the two motors on this articulated locomotive is the same as that of the single motor in the one just described. The mechanical arrangement is, however, entirely different, the jack shaft in each half being geared to the corresponding motor shaft. The Siemens-Schuckert Company is also building for the Silesian Railways a locomotive with gear-wheel drive on jack shafts.

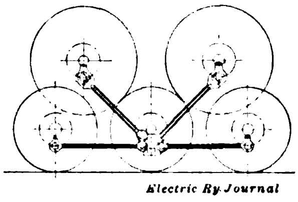


LOCOMOTIVE WITH TWO JACK SHAFTS COUPLED TO ONE MOTOR

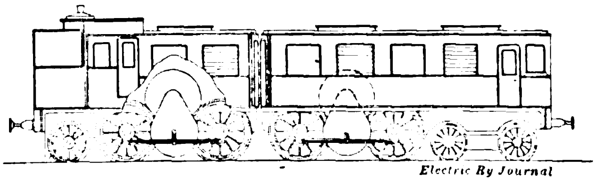
Before leaving the subject of new designs, mention must be made of the so-called "two-rod drive" developed by Brown, Boveri & Company. Two locomotives of the general type 1-C-1 have been ordered from this firm by the Baden State Railway Administration for service on the Wiesental line. The special feature of this design, also illustrated, is that the two motors, which are mounted near the center of the body and well above the centers of the driving axles, drive direct on to the central driving axle without the intermediary of any jack shaft. The arrangement follows the lines of the Scotch yoke system in that the bearing on the crank-pin of the driving axle is free to move up or down in a vertical slot in the connecting rod which connects this crank with the corresponding crank of one of the motors. It differs, however, from the Scotch yoke in that the two connecting rods from the cranks of the two motors are pivoted together at the bottom angle instead of being rigidly connected so as to form a frame. This design is used to eliminate the heavy and expensive jack shafts with their cranks and bearings, etc., and to provide an arrangement in which great accuracy of adjustment of motor axle and jack-shaft positions is necessary.

LOCOMOTIVE EXPERIENCES

Attention has been drawn in the technical press to the difficulties experienced on the Wiesental Railway with the locomotives supplied by the Siemens-Schuckert Company. These locomotives are of the 1-C-1 type with two single-phase motors driving down by connecting rods on to a single jack shaft between two of the three coupled driving axles. Nine of these locomotives were delivered during 1913, and during the first month of working a number of mishaps occurred, some trifling and others more serious. The occurrences of minor importance were due to difficulties with the four-part motor bearings, the sand pipes and other small details. These matters were put right without any serious disturbance or any substantial modifications of the general design. The more serious mishaps were apparently due to some fundamental cause. It was found that at a certain speed the connecting rods and coupling rods on both sides of any of these locomotives started to vibrate and that this vibration gradually increased as the speed rose until, at a speed of about 22.3 m.p.h., it reached a maximum of considerable amplitude. This speed seemed to be the equivalent of resonance, as the vibration practically disappeared as soon as the speed had risen to 24.8 m.p.h.



TWO-ROD DRIVE



LOCOMOTIVE WITH EACH JACK SHAFT GEARED TO ONE MOTOR

This peculiarity of coupling-rod systems is observable on practically all locomotives in which the effort of the motor or motors is transmitted to the driving axles by means of connecting rods, especially where a pair of motors are coupled to a single jack shaft or are rigidly coupled together by any arrangement of connecting rods. It is not confined to the construction adopted for the Wiesental locomotives but is also observable with Scotch yokes, as on the 1-E-1 locomotive for the Lötschberg Railway, on which breakages of the yokes have taken place.

Having determined the fundamental cause of breakage, the Siemens-Schuckert Company devised a new arrangement—particulars of which the author is not at liberty to publish—which, so far as can be seen after several months' working, eliminates the trouble. The new arrangement does not require any far-reaching alteration to the general design, the jack shaft being used as before with the two connecting rods and the coupling rods on each side.

At present there is a tendency on the Continent toward the use of gearing rather than connecting rods for transmitting the torque to the jack shaft or direct to the driving axles. If the author is not mistaken,

---

*Abstract of a paper printed in the *Journal* of the Institution of Electrical Engineers, London, and supplementary to Mr. Lydall's previous paper on "Driving Systems of Electric Locomotives," as abstracted in the ELECTRIC RAILWAY JOURNAL for Dec. 27, 1913.

this is also the general conclusion in the United States, where the connecting-rod drive does not find much favor. For express passenger service, however, there still remains the difficulty of excessive gear velocity if gear drive is employed. For speeds which would be required in England, say, 75 m.p.h., it would hardly be practicable to run without some kind of forced lubrication for the gears, as, for example, by jets of oil directed against the surfaces of the gears in contact.

MOTOR AND CONTROL EQUIPMENTS

Motors for locomotives may be divided into two classes, namely, geared and gearless motors. The geared motor seems practically confined to locomotives of moderate speed, as, for instance, locomotives whose maximum speed never exceeds 60 m.p.h. to 65 m.p.h.; whereas for express passenger locomotives, with which speeds up to 80 m.p.h. or 85 m.p.h. may be reached, the gearless motor practically holds the field.

For d.c.-motors of moderate capacity there seems no difficulty in raising the supply voltage to 2400, as in the case of the locomotives for the Butte, Anaconda & Pacific Railroad. A step in advance of this is being tested on the Lancashire & Yorkshire Railway, where motor-car equipments are being supplied by Dick, Kerr & Company, each consisting of four 250-hp 1650-volt single-reduction single-geared motors with driving wheels of 44-in. diameter, the supply voltage being 3300. These equipments are said to work with perfect satisfaction, but it is evident that in some places inside the motor the clearances between live parts and the frame must be comparatively small. The electrical designer would feel happier in making the motor with ample internal clearances, and this could only be done by freeing the motor, by one or other of the various methods available, from the restrictions of the gage and the wheel diameter..

In considering the two a.c. systems the question of frequency is important. For three-phase locomotive motors, especially those operating in cascade, a low frequency is desirable. So far as capacity in relation to weight and bulk is concerned, polyphase induction motors make a very good showing. It must be remembered, however, in comparing induction motors with motors having series characteristics, whether direct current or single-phase alternating current, that the induction motor is rated at its maximum speed, that is to say, at a speed which may correspond to permissible maximum peripheral velocity of the rotor, whereas the series motor is rated on the basis of a speed which may be, and often is, not more than half the maximum. If series motors were especially designed to give their output on the one-hour rating at their maximum speeds they would compare very favorably with induction motors. In practice, the single-phase motor, even at the low frequency adopted as the standard on the Continent (sixteen and two-thirds or fifteen cycles) is undoubtedly more bulky than the d.c. motor.

In the course of the ensuing discussion J. B. Sparks, consulting engineer, London, said that the heavy currents in single-phase motors probably constituted one reason why single-phase locomotives are so much more expensive than d.c. locomotives. The cost of d.c. locomotives is already only $300 or $350 per ton. For example, the average cost of the forty-seven locomotives of the New York Central Railroad works out at just over $35,000, which is a little more than $300 per ton. Very few figures have been published for single-phase locomotives, but the cost is approximately double that of d.c. locomotives. For example, the 800-hp, 53-ton locomotives for the Mittenwald Railway cost nearly $30,000, or $560 per ton.

Preliminaries to the Financing of Electric Railway Projects

BY H. J. DOUDS, IN CHARGE OF DEVELOPMENT DEPARTMENT, J. G. WHITE COMPANIES, NEW YORK

We have presented to us every day from twelve to eighteen projects for the organization of new companies, the development of new properties, and the purchase, sale or extension of existing ones. About 20 per cent of these proposals concern electric railways. About 90 per cent of these projects are submitted to us in very incomplete form. Some suggestions as to the way in which they should be prepared in order to receive attention by bankers should be of interest to readers of the ELECTRIC RAILWAY JOURNAL.

Take a typical case of an electric railway that it is proposed to build between two towns. The first things we want to know are the names of these two places and where they are located. Too often the answer will be that they are so many miles apart, but that their names and situations cannot be disclosed. In such a case naturally there can be no further negotiations, for financiering cannot be initiated on pure hypothesis. But if the names of the towns are given, the information, of course, includes the States in which they are located. This enables us to tell at once the "local color" as to the acts or attitude of the legislature or of the public service commission of the State regarding such public utilities, which may have an important bearing on the proposed investment.

The population of the two places and of the towns and townships in between, as shown by the latest United States census, should be given. We use these figures as a basis, making a proportionate allowance for the number of years that has elapsed since the last census was taken. To determine whether there have been any unusual factors influencing the growth of the population we check these federal statistics with the latest school census, post-office receipts, city and telephone directories. If no survey has been made of the contemplated route, the proposer should furnish approximate distance figures of the route mileage between the two towns.

Next is the question of the community of interests between the two places and the others that will be reached by the new road. Are the people interested in each other's welfare? Is the largest town the trading center of the surrounding country? What is the character of the population? What percentage of them own their homes? Are they thrifty, as shown by savings banks deposits? What industries are there in the region, and what is their history as to continuity of operation, labor troubles, etc.? From such information earnings of the new road are estimated, checked by further calculations as to probable car-mile and per-mile-of-road earnings. The latter are also checked with the gross earnings of analagous enterprises that have been in operation under similar conditions in other parts of the country.

Some of these data should be furnished by the proposer, when placing the matter before the financier. All will be checked by the engineer making the first investigation or reconnoissance survey, which will follow if the proposition seems sufficiently promising. This survey is invariably made at the expense of the proposer. If the project is accepted, the final surveys and all other engineering expenses are defrayed out of the construction funds.

Let me digress for a moment to say that when an owner presents himself or his case to a live, up-to-date concern, his statements are accepted as absolute facts. He is not asked to corroborate anything at the first interview or in the first instance. Everything that he says is considered true until it is proved otherwise. If the project seems attractive, he may be asked to show proof of his statements. If it is not interesting —and the proposer is primarily an optimist who puts his best goods in the show window—it is no use discussing whether he is telling the truth or not.

From the data originally supplied and subsequently verified, and from the additional data gathered by the investigating engineer, the estimated cost of the road is arrived at—complete with all its right-of-way, grading, track, overhead, terminals, power houses, rolling stock, signal system, telephone lines, waiting stations, fencing, cattle guards, and all the little items that mean large amounts. In this the item of carrying charges during construction—the "dead" interest on the investment—should not be overlooked.

With all these items added together you have the total cost of the railroad. Assuming that the underwriting will be taken on a basis of 80 per cent for the bonds, the result is a bond issue of one-fourth more than the cash cost. From the rate of interest they bear the total fixed charges may be calculated instantly. How much will be available to pay these interest charges is arrived at by deducting from the gross earnings the operating expenses, taxes and depreciation.

Now we come to a point which no two bankers look at in exactly the same way. One banker will not touch a construction proposition if it does not show net earning of two and one-half times the interest charge. Another will be satisfied with less. These net earnings are applicable to the payment of interest and retirement of bonds through a sinking fund and to the payment of dividends on the preferred and common stock, in the order named.

If the road is being promoted by the "boosters" in the towns, the local interests will care only for the benefit that the community will derive from the line. These expect to reap their profits from the new road by the enhancement of real estate values, by increased sales of merchandise and by general trading. Their returns come quickly, and it is not of vital consequence to them how long it is until the road gets on a sound financial footing. The banker, however, has no other interests in that vicinity than the return from his bonds and the possible dividends on his stock.

Therefore the problem is to keep the interest charges down by making the bond issue low. A certain amount of money must be provided, outside of donations, subsidies, etc., and the financier or the owner must raise the additional sum. This money must be derived from the sale of securities that rank lower than the first mortgage bonds—preferred or even common stock.

Thus far we have dealt with the financing of a projected electric railroad. In the case of an existing property—a going concern—being offered for sale similar information should be supplied by the owner. The names of the towns through which it passes, the full corporate name of the road, a history of its ownership from the beginning (to show if it has been in financial difficulties, had strike troubles, or has been afflicted with any other ills) should be given. The financier must also know the exact route of the line. This, of course, should include a profile showing grades, together with a full statement of the line's general physical condition. Furthermore, the conditions under which the franchises have been granted and the length of their unexpired terms must be clearly set forth. The political complexion of the towns and of the regions roundabout them also are of much importance. The owner also should furnish annual reports, in detail, and balance sheets for several years back. The financier also desires to know where the outstanding securities are held, and if they can be taken up and retired by exchange or otherwise.

Not only present conditions, but also the future possibilities of the property are important. What profitable extensions could be made? How much would they cost and how much would they earn? Are there any other utilities in the towns that might be operated from the same power station, thereby reducing the cost of individual operation? The answers to these and to other questions that will occur to the experienced railway man are essential.

Finally the purchase price of the property comes up for discussion. This is technically known as the "basis" on which the property is to be bought. By this is meant that if a man wishes to sell a property for $1,000,000, including all bonds and stocks, free of all indebtedness, and that if the property shows earnings from operation, before the bond interest is deducted, of $100,000, the investment will return 10 per cent. The property would then be bought on a 10 per cent basis. If it earns only $70,000, it would be on a 7 per cent basis, and so on.

This "basis of purchase" is one of the fundamentals that is asked for by every financier, but the average man who brings a property up for sale seldom knows what it means. The basis of purchase varies. One banker may want a greater return than another. It depends on many things. A banker may buy a property on a 5 per cent basis because he has other interests that will fit in, and he may turn around and issue 5 per cent bonds against the property, making no profit on that particular investment, but deriving his gain from the enhancement of his other properties that will be benefited by it. On the other hand, some properties might not be considered even on a 10 per cent or 12 per cent basis because of their location or for a score of other reasons.

What class of electric railway projects are bankers most interested in at present, city or interurban? They are most interested in going concerns in the larger cities and centers of population. Under conditions as they are at present they do not care much for projected interurban roads. This is because the best earning locations are already occupied. Many small cities of from 5000 to 15,000 population are coming into the market and asking for financial help in building roads. Usually towns of this size are not regarded as favorable fields for financing. The average earning power of an electric road in such communities is too small.

It is hardly possible, in my opinion, to say what parts of the country bankers and investors look upon with the greatest favor, so far as electric railways are concerned. It depends entirely on the size of the city—the larger the better, for the earnings of electric railroads depend almost altogether on passenger traffic.

It has been generally considered that from 800 to 1000 population per mile of track exclusive of the principal terminal city should be the minimum for an electric interurban railway. That means the population in a strip 3 miles in width on each side of the track, or 6 miles in total width. There are many individual cases, however, where the character of the population or industries is such as to make interurban railways good investments yielding satisfactory earnings from a lower population per mile. With a city railroad the distances of travel must be sufficient to induce patronage of the cars, and this fact explains the general lack of success of lines in small towns.

What would be considered the minimum earnings per mile of track to be attractive? About $5,000. To explain: If a road earns $5,000 per mile and its operating expenses are 60 per cent of its gross income, the net earnings from operation would be $2,000 per mile. If the road costs $25,000 per mile in bonds to construct (a very low figure), its interest charges, at 5 per cent, would be $1,250 per mile. Deduct this from the $2,000, and there will be $750 a mile left to take care of the sinking fund, operating contingencies, shrinkage in business due to various causes, and so on. Five thousand dollars a mile would be about the minimum that would be attractive to a financier.

What percentage does the banker require for underwriting? That cannot be answered because each project stands on its own merits. If a project is to be built solely from funds accruing from the sale of first mortgage bonds, which the banker has to handle, he would naturally expect to have a sufficient margin in the price at which he takes the bonds to cover his selling expenses and profit. This may vary from 8 per cent to 15 per cent. He would also naturally expect to control the stock—to have more than 51 per cent of it, for, if he put in all the money, he would want control of his property. But if there were a large equity, making the bonds a safer investment—due, for instance, to local interests taking junior securities, then the price at which the banker would take the bonds might be higher and his proportion of the stock might be decreased.

Lastly, what percentage of the projects submitted are rejected for one reason or another, and how many are finally financed? Not to exceed 1 per cent of the projects submitted are financed by anybody, principally for the reason that 99 per cent of them do not show sufficient earning capacity. That is practically the sole reason. Other things can be overcome, but not that. It is the touchstone of every proposition in every field.

Inefficiency and Extravagance in Municipal Operation

Logan G. McPherson, chief of the Bureau of Railway Economics in Washington, has been delivering a series of lectures on modern railway problems at Johns Hopkins University. One of his recent lectures related to objections to government ownership of railways, and a number of new points were brought out in connection with this subject. The lecture applied particularly to interstate carriers and federal ownership and operation, but a great deal of what Mr. McPherson said applies with equal or even greater directness to the municipal ownership and operation of electric railways. The following are some of the points mentioned by Mr. McPherson:

"A prime distinction between political activities and economic activities is that the former are not engaged in the production of wealth, while the latter are. The underlying effort of all industry and commerce is to make 'two blades of grass grow where but one grew before,' or at least to see that 'a new dollar is returned for the dollar that is expended.' Political government has been under no necessity of making its activity immediately productive. To it, making both ends meet means no more than the levying of taxes sufficient to meet the expenditures. The people of the United States have many reasons to be proud of their government, but the manner in which public money has been expended is not among them.

"The folly that has characterized many Congressional appropriations for the improvement of waterways, to enable them to carry traffic that never by any possibility will come to them; for the erection of public buildings for the purpose of enhancing the value of real estate in a struggling town, and the ease with which millions after millions have been added to the pension roll, causing its aggregate to increase after the time when in the nature of things it ought to decrease, is known to all men.

"Such appropriations entail expenditure in utter disregard of sources of income. All sorts of committees initiate all sorts of expenditures, and the wherewithal comes from taxation. States and municipalities add recklessly to the burdens of taxation, and yet the administration of most of our large cities is so far inferior to that of cities of corresponding size in Europe as to make their condition a by-word.

"As the franchise in this country is held by virtually all male adult citizens, it is natural that great bodies of voters should seek to obtain, through governmental action, benefits which they have been unable otherwise to secure for themselves.

"Manufacturers have sought advantages through protective tariffs; railroad promoters have sought vast grants of land. It is not many years since it was common belief that legislation was controlled by the men in charge of the large business interests, and oftentimes by unworthy methods. Admitting that there was a large measure of foundation for this belief, it is a sad commentary upon the quality and the integrity of the men elevated to public office by the votes of their constituents.

"Now the tables are turned. It is the organizations of great bodies of voters, such as the trades unions, who have lobbies at the federal and State capitals; who negotiate with a candidate before his election as to what he will do in return for their vote; who send telegrams of congratulations to governors when they approve bills instigated by the labor organizations.

WOULD CONDITIONS BE BETTER UNDER GOVERNMENT DIRECTION?

"Would the problem be solved, would the condition of the country be advanced, if the control of industry and commerce were placed directly under the auspices of the office-holders elected by the political democracy, instead of under the executives chosen by the industrial democracy? The army and navy are large organizations administered by the government, but they are not concerned with obtaining return for the money expended. The condition of the army at the beginning of the Spanish war did not afford a high testimonial to the efficiency of its administration, and it has often been claimed that there is a log-rolling in connection with the navy yards, as well as in appropriations for government buildings.

"As has time and again been pointed out, when a large organization is under the control and administration of a governmental body, that administration is affected in many ways by political influence. A public regulatory body, especially an appointed commission of the type now exemplified by the Interstate Commerce Commission and by the railroad and public-service commissions of the many States, is far less responsive to political influence than is a legislative body whose members are elected for short terms and who persistently seek re-election. Such a body may be an efficient critic and censor of the conduct of a business organization, although its own organization be defective and poorly administered. With proper authority it can bring pressure to bear upon those actually charged with the administration of business organizations that will cause them to remedy abuses such as a political organization would have great difficulty in remedying within its own ranks.

"If the railroads were taken over by the government it would be inevitable that no end of questions would come into politics that are not now subject to political decision.

"It is almost inevitable that the tremendous voting power of the railway employees would cause their votes to be sought by politicians with various promises of increases in pay and easier working conditions. The party in power, by having control of the railways, would have control of the nation. Should there come to the Presidency a man with the ambition to establish a dictatorship, his pathway would be the less difficult.

PERSONNEL LARGELY THE SAME

"It is impossible that under governmental ownership the railways would be manned in any appreciable degree by other than the employees now in their service. There probably would be more or less change in the officers charged with administration and management, but there could not be a great deal of change even in these, because men capable of filling such positions are now all too few. The great body of under-officials and employees would, of necessity, be constituted almost entirely of the same men of whom it is now constituted. Responsibility for their performance would rest ultimately with government officials elected by the people, instead of with officers owing their positions to their efficiency and retaining their positions only so long as their efficiency continues.

"The experience of the country with appropriations for river and harbor improvements and for public buildings gives ample reason for belief that if the building of new railroads were to become a matter of Congressional appropriations, Congressmen would endeavor to get railroads for their districts, and there would ensue interminable log-rolling and wasteful appropriations. It is almost inevitable that the shippers of a particular section of the country would cast their influence for the candidate who would endeavor to obtain rates that might give them an advantage in competitive markets. The result would be that the freight-rate structure of the United States, that has been undergoing a gradual adjustment to the needs of commerce, would be thrown into confusion.

DEFECTIVE PUBLIC ACCOUNTING

"That which the people through this regulatory body have been able to do in bringing to the clear light the receipts and expenditures of the railways, they have never been able to bring about for the receipts and expenditures of the political governments through the officers they have elected to administer those governments. The nearest approach that the government now makes to conducting a business enterprise is in the distribution of the mails, and the Post-office Department has never even been self-sustaining. A recent Postmaster-General reported that the deficit in the operation of the Post-office Department has been turned into a surplus, but that report was arrived at through distorted accounting, as reprehensible as any ever undertaken by financial buccaneers in railroad exploitation.

"In so rich a country as the United States the burden of taxation has not fallen heavily upon the people, although it has been asserted that if the aggregate taxation, direct and indirect, of the federal government, the State governments, the municipalities, and other political entities having the taxing power were assigned per capita, the proportion would be found to be greater than in any of the heavily-taxed countries of Europe.

"If the government were to take over and operate the railroads with the same degree of business inefficiency and business laxity that has characterized other phases of its administration, it would not be many years before taxation would bear severely upon every taxpayer.

"If the government were to take over and operate the railroads, the express service, the telegraph and telephone service, it would be the largest purchaser of coal, of iron, and steel, likely of lumber, and other of the great commodities of commerce, and its payroll would be increased by over two million employees. With their families this would mean that over ten million persons, or one out of every ten in the United States, would be directly dependent upon governmental disbursement.

"The entire country is in a ferment of economic education. The theory of our government is that its institutions rest upon the will of the people, and that they shall be determined only after thorough popular discussion and deliberation. It is to be hoped that the present discussion will not be cut off by a precipitate decision on the question at issue, but will continue until there is thorough understanding of the economic transition which has been taking place during the last half century."

A Warning for the Operator of a Power Plant

The zest of operating engineers to save time on repair work is sometimes too keen for their welfare. A recent discussion of the dangers of attempting to repair boilers, tanks and piping while such apparatus is under pressure which appeared in an accident insurance company's bulletin contains a valuable hint in the interests of safety. The man who undertakes work of this kind probably realizes that some danger inheres, but the disposition to overlook the risk of accident and to take chances should be frowned upon by all executives. Strict orders prohibiting the practice should be issued, and severe penalties should follow their violation.

A calking tool should never be used to stop a leak under pressure, nor should pipes, unions or couplings be turned up, nor nuts be tightened, until the pressure has been entirely removed. The occurrence of leakage, in a pipe or fitting or elsewhere, is often an indication that there is a weakness at that point, or that the parts are improperly fitted together. In making up pipe into fittings some of the threads may be destroyed if the work is not done carefully; and when the fittings are bolted together there may also be stripped or defective threads on some of the bolts. It is evident that no good can be accomplished in cases of this kind by overstraining the already weakened parts in any way, and safety requires that the pressure should be taken off before an attempt is made to remedy the trouble. A thorough and complete examination of all the parts can then be made, and the repairs can then be properly handled and without danger to the operator.

Leakage is often caused by poorly fitting gaskets around manholes and handhole openings, by worn or displaced valve packings, or by corrosion. In every case of this kind the trouble should be remedied in a workmanlike way and not by trying to force a fit by screwing up a nut so as to seriously overstrain a bolt that may already be carrying all the load which should be allowed upon it. The attempt is often made to stop leakage around the header caps of sectional boilers by setting up the nuts that hold them. Threads may be stripped in this way when the attendant knows well enough that the real trouble is that the caps do not seat properly, owing to corrosion or to the accumulation of scale or dirt on the bearing surfaces. The only possible gain is the saving of a little time and trouble, and the chance of accident accepted in such cases is altogether too great a price to pay in return for trivial benefits of this kind.

Corporation Morality and Business Unrest

The leading article of the public utilities number of the Chicago *Herald*, published on June 30, was contributed by Timothy S. Williams, president Brooklyn Rapid Transit Company. Mr. Williams discussed the effect of past corporation practices upon the present business unrest and said in part:

"Measured by practical results of business enterprise, what justification is there, or has there been, for recent legislation or official administrative action that has reduced earning capacity of city transportation and industry, forced thousands of men out of employment, impoverished widows and orphans dependent upon the income of investment, imposed excessive and burdensome taxes, and actually threatens the right of property supposed to be secured by the Constitution?

"Take the case of the steam railroads—is there any real or general dissatisfaction with rates or service? If some railroad investors have made excessive profits, a very much larger number have made losses, and the great majority have had unreasonably small returns. In the meanwhile, whether railroads were struggling to meet operating expenses and interest or not, every individual affected by railroad operation has been a beneficiary. There is not any product of capitalized human effort so cheap to-day, considering the great cost of production, as transportation.

VALUE OF PUBLIC UTILITIES

"What is true of the steam railroads is equally true of other public utilities—the street railways, the telephones, the electric lights. The expansion and consolidation of street railways have made possible the growth and development of cities corresponding to what steam railroads have done for the country. They have been important factors also in improving the social conditions of cities. They have made it possible to relieve congestion of population—to enable the workers of small means by reason of low fares to have their homes where children can be brought up under healthful conditions, with fresh air and sunlight and wholesome exercise.

"With all the abuses which have accompanied prosperity's growth, the material results have not suffered net injury therefrom. The stimulus to enterprise and investment even under bad influences and by means of wrongful practices has given to the people lower rates for transportation, illumination and telephones, and lower prices for monopolistic products than would have been brought about without that stimulus.

"The inherent and principally controlling cause of business troubles is the feeling engendered throughout the country by the exposure of some conspicuously flagrant misdeeds of business, due to plain violations of some very old moral maxims. Owing to the activities of politicians violating the same maxims, the punishment inflicted, instead of being, as it should have been, personal to the offender, has been unjustly meted out to enterprise and effort generally, and the sins of a few fathers of industry and finance seem likely to be visited upon the children of many generations.

REMEDY FOR PRESENT CONDITIONS

"What is the remedy for existing conditions? Is it still more drastic legislation? In government ownership and operation of public utilities? In more severe regulation, covering additional activities? Even in government price-fixing of exchangeable commodities? And finally, perhaps, in a radically changed form of government—socialistic, despotic or anarchistic? It is to be hoped not. Some men in public utility work urge the education of the public to clearer economic and political views, to closer acquaintance with the difficulties and burdens of discharging corporate obligations. This is proper, but the most important thing is to make the people forget and respect, and this can be done only by convincing them that business is conducted honestly, sincerely and fairly.

CORPORATE MORALITY

"The standard of morality is vastly higher in business life to-day than it is in political life. The fact that the larger part of the country's business is done through the medium of corporations presents in itself the opportunity for encouraging a high plane of conduct. For the corporations are after all merely the organized expressions of individual aims and substance, and the list of stockholders are a constantly increasing constituency.

"In such organizations there are behind corporate activities the sentiments and convictions of citizens who are stockholders and who, as a rule, prefer to intrust their investments not only to those who are capable but to those who are honest and intelligently progressive. The day has passed in large corporations when any individual stockholder or any combination of stockholders can, if disposed, force dishonest methods or fraudulent practices upon their operating staffs.

"If I am right in these observations as to present ideals among the managers and stockholders of corporations, then it is only a question of time when public sentiment will change. When the public is once convinced of corporate sincerity and honesty we need have no apprehension of the ravages of demagogues and politicians. We can then state our problems frankly to the people, confident of their intelligent co-operation and support."

OTHER ARTICLES

Two other articles in the public utilities number of the *Herald* of interest to electric railway officials are those written on the subjects of intangible values and of small-denomination bonds by L. R. Nash, of Stone & Webster, Boston, and J. W. Wilder, of N. W. Halsey & Company, New York, respectively. Mr. Nash says that the last year has witnessed some noteworthy developments with reference to certain elements which enter into "fair value" for rate-making purposes. There is reasonable consistency among the state commissions in determining the costs of physical property and the "overhead" charges in connection therewith. On the other hand, there has been radical disagreement in the treatment of so-called "intangible" values. The broad contention underlying the decisions of courts, however, is that public utility enterprises involve other elements of value on which return should be allowed than the existing physical property. Such property is only the "bare bones" of a system which, as a whole, is a live, serviceable entity.

According to Mr. Wilder, bond houses are awakening to a new opportunity in the sale of small-denomination bonds. The time has passed when a little investor can offer as an excuse for not buying high-grade bonds that these bonds are not issued in $100 denominations. Furthermore, he is being educated to their benefits by widespread campaigns of education through magazines and newspaper advertising, booklets, correspondence and the personal solicitation of salesmen. There can now be found on the lists of the most responsible bond houses issues which come in denominations of $100 and $500 as well as $1,000, and the bond houses are going after the business of the small investor as well as that of the man of wealth. A bond house will even assist the small buyer by letting him purchase bonds on partial payments.

Meetings of Committee on Way Matters and Joint Committee on Claim Accounting Result in Formulation of Recommendations—Convention Exhibit Plans Making Encouraging Progress

COMMITTEE ON WAY MATTERS

A meeting of the committee on way matters to pass upon reports to be presented at the annual convention was held at the board rooms of the Washington Railway & Electric Company on July 17 and 18. Those present were the chairman of the committee, C. S. Kimball, engineer of maintenance of way Washington Railway & Electric Company; E. H. Berry, engineer of roadway Cincinnati Traction Company; C. H. Clark, engineer of maintenance of way Cleveland Railway Company; E. P. Roundey, engineer of maintenance of way New York State Railway, Syracuse Lines; W. F. Graves, chief engineer Montreal Tramways Company, and R. C. Cram, assistant engineer way and structure department Brooklyn Rapid Transit System.

After considerable discussion the committee adopted reports upon "The Use of T-Rails in Paved Streets" and "Alloyed Steel Rails." A supplementary report on "Interurban Tracks" was also considered, but the committee concluded that there was not sufficient time to give the matter attention this year and the report will be turned over to the committee on subjects for such action as it may see fit to take. The committee had also collected interesting information regarding the topic "Pavement for Use in Connection with Girder and High T-Rails," but, as there was not sufficient time to give the subject the attention it deserved, the material will be turned over to the ensuing committee. In response to a request that this year's committee present T-rail standards for consideration of the convention, the decision was reached that it would be unwise to go into this matter this year and the correspondence on the subject will be turned over to the secretary for the use of the committee on subjects.

JOINT COMMITTEE ON CLAIM ACCOUNTING

A meeting of the committee on claim accounting was held in New York on July 27 and 28. It was attended by H. J. Davies, secretary Cleveland Railway, and P. C. Nickel, claim agent New York Railways, co-chairmen, and H. K. Bennett, claim agent Fitchburg & Leominster Street Railway. The committee considered a scheme of classification of accidents which had been prepared in preliminary form. This will be revised and sent to all members of the joint committee for approval.

ATLANTIC CITY CONVENTION

The accompanying illustrations show the marked improvements in appearance which have been made in the interior of Machinery Hall, Atlantic City, in preparation for the convention of the American Electric Railway Association next fall. The front part of Machinery Hall, which was used as a power plant for years, has been refloored, repainted, the ceiling and pillars covered with lattice and the floors with Crex. This space will be used as a rest and reception room. The rest of Machinery Hall, that is Machinery Hall proper, has been repainted, recarpeted, and furnished with easy chairs and is used as a rest and reading room for pier patrons. There will be no high partitions between the main building and Machinery Hall as in former years.

The removal of these partitions now makes Machinery Hall a part of the main building. A good view of it can be had from the main entrance to the pier.

Mr. McConnaughy, of the Manufacturers' Association, calls attention to the fact that the championship baseball games occur at about the same time as the convention. He fears that this may interfere with the preparation of the exhibits and, as everything must be ready on Saturday, strict attention to business during the week preceding the convention will be necessary. Mr. Eldredge will not deliver goods or furnish help on Sunday, and all Saturday night and Sunday work will be charged at double time.

MACHINERY HALL IMPROVEMENTS—FRONT OF HALL, SHOWING NEW LATTICE WORK

MACHINERY HALL IMPROVEMENTS—SOUTH SIDE OF HALL, SHOWING REPAINTING AND REMOVAL OF PARTITIONS

The following new companies have been enrolled as members in the Manufacturers' Association during the week ending July 30, 1914: Prest-O-Lite Company, Inc., Indianapolis, Ind., and Street Railway Signal Company, Philadelphia, Pa.

Under the caption of Foreign Trade Opportunities, No. 13,390, the *Daily Consular and Trade Reports* contains a note to the effect that an American consular officer reports the need of a new electric light plant for a city in his district. Contracts have been signed for carrying out this work. The contractor states that most of the material to be used will be imported from the United States. It is also probable that an electric tramway will be built. A copy of the complete report containing further details can be obtained from the Bureau of Foreign and Domestic Commerce, United States Custom House, New York, or 629 Federal Building, Chicago, Ill.

COMMUNICATIONS

The Economy of First-Class Maintenance

SOUTHWESTERN ELECTRICAL AND GAS ASSOCIATION
DALLAS, TEX., July 28, 1914.

To the Editors:

In the article by "Contributor" on the subject of manganese renewable-wearing-part special work there is evidenced not only ingenuity in overcoming the difficulties of replacing the worn parts but, also, an appreciation of some particular points that are nearly always at the bottom of the complaints as to trouble with pieces of special work and with straight track itself. I refer particularly to the second and last paragraphs in which he speaks of the necessity of extra first-class work in original construction and later maintenance and of the necessity of constant inspection.

It is safe to say that, outside of some elevated and some underground roads, and at points on surface roads where there is very congested traffic, the average street railway, even in the large cities, pays less attention to the proper inspection and true maintenance of its track and special work than it does to any other portion of its property, and this in the face of the fact that its track is often the most costly section of that property, is subject to wear, tear and abuse that is beyond its control and is the most difficult portion of the property to properly and thoroughly inspect and the most costly to repair. It would seem that such an array of adverse and difficult conditions would naturally lead to the most perfect installation that was possible, to an inspection that caught the stitch before it dropped and to a "maintenance" that maintained and did not content itself with mere "renewal or repair."

"Contributor" contributes a vital truth, unheeded by most track and roadway departments, when he says: "The cost of constant effort in this direction (true inspection and maintenance) is a very small percentage of the money value of special track work which becomes unfit for use on account of early and unnecessary disintegration."

He could have gone further and applied this to the whole track and to the cars running thereon, for the character of track is a large factor in the life and cost of maintenance of every portion of the rolling-stock.

When one considers the great initial cost of track materials and the extraordinary cost of replacing any portion of them, especially in city streets and during operation of the cars, it would seem that, of all the different sections of the property, the track and roadbed would be that which would receive at least as careful inspection and maintenance as the power station, the overhead or underground lines and the rolling stock. Instead of this and excepting, possibly, the current return circuit, track is trusted to inexperienced men, usually to a "track foreman" and a gang of track hands. Even where there are men of higher rank in the track and roadway department they are apt to be "technical" and "office" men, engineers, draftsmen, designers and superintendents rather than "practical detail" men trained and competent to insure proper inspection and prompt and thorough maintenance.

Were the subject not so serious financially, the contrast between the liberality with which the average street railway treats the inspection and maintenance of its power station, rolling stock and its transmission lines, and the costly stinginess with reference to the exact and timely inspection and maintenance of its track would be ridiculous. Here is track that nearly equals in original cost all the other portions of the property, that costs from 50 to 100 per cent more to replace, but its inspection is either neglected and reports of trouble are allowed to come through thumping cars and derailments, or else the whole matter of inspection, report and repair is left to those whose only instruments of precision are an iron track gage, a wooden level and a bundle of "shims."

In an article on another item of track construction written some time since, the writer said this: "A piece of new track so laid that there is no lost motion whatever between its component parts is in position to maintain itself in that condition for a long time; whereas a piece of new track with lost motion, or the opportunity to produce such early, is already in process of disintegration. The one is a compact unit, resisting as a whole; the other is a cluster of self-destroying pieces."

And I would say further that what is true of new track is equally true of track in use. If the integrity of the "compact unit" is properly maintained, if threatened lost motion and undue wear are caught when their very first symptoms are manifested and the original integrity is promptly restored, the life of the track and rolling stock is greatly increased and repairs and power loss are greatly decreased.

There is no part of a system of a street or interurban railway that pays so good a rate of interest on perfect construction and maintenance as the roadbed and track, and there is no portion that is so neglected in construction and maintenance. Track that costs from $15,000 to $20,000 per mile and whose "rate of depreciation" is high under the best conditions, is left to the tender construction mercy of a partially supervised contractor or a "gang boss." "Inspection" is left to motormen or conductors, and "maintenance" to a track boss to whom an eighth of an inch is a miscroscopic refinement of measurement. And this not only applies to the little "neck-of-the-woods" electric railway company but to almost every street railway in the larger, and even largest, cities in America. I have yet to see a street railway system where, while riding in its cars, I could not pick out joints, blocks and whole streets and sections that told their tale of faulty construction and faultier maintenance through the car.

In these days of "scientific management" and "efficiency engineering" it seems astonishing that more exact and particular attention is not paid to this subject. The manufacturers of rail, fastenings and special work are willing and anxious to better their products if the way is shown them, but their efforts are liable to be brought to naught by the neglect, carelessness or ignorance of those who install and use their products. What would be thought of the constructor of a central station who built his engine and generator foundations unstable and out of level, who assembled the parts by rule-of-thumb and fastened them together insecurely? What would be thought of the chief engineer whose prime movers were continually thumping, heating and "getting out of whack," whose auxiliaries were out of efficient commission about half the time? And yet these are the average conditions of a large proportion of the street railway track of the country. Outside of some sections of a few cities where track has been in use some time and has been properly built and maintained and excepting brand-new track, smooth, free-riding track is an exception. It is, ordinarily, "bump, twist and rattle" to the discomfort and annoyance of the passenger, and the mutual destruction of track and car. For "bad track" is not only a contagious infection to the cars that run on it but it is a mutually cumulative evil, the worse the track the greater the deterioration produced by the cars and the more the track injures the cars, increases the fuel bill and swells the accident-damage account.

We are spending large sums for costly and intricate machines that repair while we refuse to pay the price of the human instruments that would prevent. We buy unpickable locks for the empty stable of the stolen horse and yet grudge a good one or a watchman for the next new stable and horse that we buy.

It is true that track is mostly "out of sight," but that is no excuse for its being "out of mind." It is true that it is subject to use and abuse by the general public over which we have no control, but that fact should not be a deterrent of foresight on our part. It should make us the more careful in our construction and maintenance; it should be an added factor for which we must provide fully. It is true that as we now build track many of its parts come to us crude, rough, scaled, rusty, dented, bent, loose and of anything but exact size, but is not this the greater reason why we should remove the defects before we put them in place?

Then we should inspect and keep on inspecting, not with a hammer or a car wheel or a derailment, but with trained men equipped with suitable instruments. Having accurate information, we should not merely repair or replace but should so do the work that the fault discovered shall never occur again.

It may be said that such refinement would increase track cost to a prohibitive amount. As a matter of fact it would increase slightly the initial cost of construction but, in reality, it would be an "insurance charge" to be distributed over the increased life of the track and paying big dividends on a comparatively small increase of investment.

Similarly the amount devoted to proper inspection and true maintenance should not be considered as merely an increase in operating expense. If a 10 per cent increase in operating expense in one place saves ten times its amount in another, that "expense" is really an "investment." H. S. COOPER.

Indianapolis as an Interurban Center

INDIANAPOLIS TRACTION AND TERMINAL COMPANY
INDIANAPOLIS, IND., July 27, 1914.

To the Editors:

Referring to the letter of S. H. Ankeny of the Greater Dayton Association, published in the ELECTRIC RAILWAY JOURNAL of July 25, requesting information as to how Dayton ranks as an interurban center, I give below for comparative purposes the total number of interurban passenger and freight cars arriving at and departing from the Traction Terminal Station at Indianapolis for the year 1913, number of passengers carried, and daily averages in each case.

There are five interurban companies operating fourteen lines out of the Indianapolis terminal as follows: Terre Haute, Indianapolis & Eastern Traction Company—Brazil Division (Indianapolis to Terre Haute), Eastern Division (Indianapolis to New Castle and Richmond), Northwestern Division (Indianapolis to Lafayette), Crawfordsville Division, Danville Division and Martinsville Division; Union Traction Company of Indiana—Northern Division (Indianapolis to Peru and Fort Wayne and Indianapolis to Logansport), Indianapolis to New Castle and Muncie, Indianapolis to Anderson, Muncie and Fort Wayne, and Indianapolis to Marion; Indianapolis & Cincinnati Traction Company—Greensburg Division and Connersville Division; Interstate Public Service Company—Indianapolis to Louisville.

YEAR OF 1913

Arriving and Departing—Traction Terminal Station

Total passenger cars	246,823
Total freight cars	23,501
Total number interurban and suburban passengers	6,524,366

AVERAGE PER DAY—YEAR 1913

Interurban passenger cars	676
Interurban freight cars	64
Interurban and suburban passengers	17,875

On account of the interruptions to travel caused by the floods during the last week in March, and the strikes which occurred during the latter part of the year, the above figures are somewhat below normal.

HARRY H. LLOYD.

Progress of French Electrification

A recent issue of the *Revue Industrielle* contains a list of electric railways in France, including steam lines which have been electrified, electric lines in course of construction and lines that are under consideration.

The electric lines of the French State Railways now in operation include Paris-Invalides to Perpignan, 6 miles; Paris to Auteuil, and Champs de Mars, 9 miles; Paris to Versailles, 16 miles; St. Cloud to Etang-la-Ville, 10 miles; Paris to St. Germain, 15 miles; and Asnieres to Argenteuil, 3 miles; making a total of 59 miles.

The Paris-Lyon-Mediterranean Company has in operation a line between Le Fayet, Chamonix and Vallorcine, 22 miles; the Orleans Company, the Paris-Juvisy line, 14 miles; and the Midi Company, the Perpignan-Bourg Madame line, 64 miles, and others from Montrejeau to Luchon, 23 miles; from Lannemezan to Arreau, 16 miles; from Tarbes to Bagnere-de-Bigorre, 14 miles; from Montrejeau to Pau, 70 miles; from Lourds to Pierrefitte, 13 miles; from Pau to Bedous, 37 miles, and from Buzy to Laruns, 12 miles. Out of a total of 350 miles electrified no less than 249 miles are on the Midi system.

At the present time 96 miles of new electric railways are in course of construction, namely, Auch-Lannemezan, 24 miles; Castelnau-Magnoac-Tarbes, 32 miles; Arreau-St. Lary, 7 miles, and Hagetmau-Pau, 33 miles. A further 80 miles of electric railways are awaiting government sanction before the work of construction is taken in hand, viz., Quillan-Belesta, 16 miles; Villefranche-Vernet les Bains-Sahorre, 6 miles; Montlouis la Cabanasse Quillan, 55 miles, and Bourg Madame to the Spanish frontier, 4 miles.

Hydroelectric Development in Chippewa Falls, Wis., District

Through the merger of the Chippewa Valley Railway, Light & Power Company with the LaCrosse Gas & Electric Company, the latter a subsidiary of the American Public Utilities Company, the parent corporation now controls and operates the new property under the name of the Wisconsin-Minnesota Light & Power Company.

The new company owns hydroelectric generating plants, with a present installed capacity of 10,000 hp, on the Chippewa and Menomonie rivers in the State of Wisconsin. The largest development is situated on the Menomonie River at Cedar Falls and comprises a reinforced concrete dam and power house of the most modern type with a present capacity of 5300 hp. The capacity of this plant may be doubled at any time by the installation of two additional units, space for which is already provided. The other plants are located as follows: On the Menomonie River, three miles below Cedar Falls, an installation of 1600 hp capacity; on the Chippewa River at Chippewa Falls, two installations with a capacity of 2400 hp, and at Eau Claire, a small development furnishing an additional 700 hp.

By means of high-tension transmission lines this power is available for electric power, light and street railway purposes in Chippewa Falls and Eau Claire, and for the operation of the interurban railway connecting these two cities. The company owns a total of over 100 miles of transmission lines.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Rebuilding Summer Cars to Center-Entrance Type

BY G. M. CAMERON, MASTER MECHANIC NEW YORK STATE RAILWAYS COMPANY, ROCHESTER LINES

The New York State Railways, Rochester, N. Y., has operated eighteen open cars during the summer months for several years. These cars were of the cross-bench, running-board type. On account of the extended running boards along the sides of these cars, they were found to be somewhat dangerous for operation and especially so where large crowds were handled. It was also very difficult to collect the fares when these cars were crowded. Early in the present year the mechanical department made a study of a method for remodeling these cars in such a way as to eliminate, as far as possible, the objectionable features enumerated.

A plan and elevation of the cars before remodeling are shown in one of the accompanying drawings. As the motor equipments for these cars are used on snow plows and sweepers during the winter months, and as some dimensions of the cars were not suitable for making closed cars for service during the entire year, it was decided to retain the open feature. Two methods were open for consideration: One was to build a vestibule of the usual prepayment type on one end of the car and arrange the seats on each side of a center aisle; the other was to cut out one sill near the center and build in steps with a lowered sill at this point properly reinforced. Estimates and plans were made up for both methods, and the center-entrance scheme was followed, as it was more economical and was believed to be a better plan from the operating standpoint.

Steel-plate panels were attached to the car posts. These plates extend from the sills up to the usual window heights, and a neat wood rail was placed around the top. From this rail up the car was left open, no sash being used. High window guards were placed along the open spaces. Longitudinal seats were placed along both sides of the car and seats built in across each end. The wood cross-benches were placed end to end and adapted for the longitudinal seats. The cars were originally equipped for operation from either end, but the rebuilt cars are adapted for operating from one end only. Accordingly, the bulkhead partition was removed from one end of the car and seats were carried out to that end. At the entrance a piece of the side sill was cut out and a lower sill attached and securely fastened at the ends of the original sill. A 5/8-in. steel reinforcing plate was run along the outside of this lower sill and attached to the main reinforcing plates by means of ample gussets. One step was built within the inclosure and a folding step arranged to extend out from the car body when doors are opened. Two pairs of wooden doors with glass panels were installed at the center opening. These doors are arranged to be operated in unison by the New York State Railways standard overhead operating mechanism. The outward step is arranged to fold in conjunction with the operation of the doors. The center opening is divided into two parts, the one to the rear or left being used for the entrance and the one to the right for the exit of passengers. A fare collection stand is placed within the car. At the time of remodeling, the cars were also equipped with air brakes and electric starting signals. This signal

ROCHESTER CAR RECONSTRUCTION—ELEVATIONS, SECTION AND PLAN OF CAR AS REMODELED consists of a lamp located in motorman's cab which lights when the doors are closed. The steel work was purchased from a local concern, framed and ready for installation. The total weight of the rebuilt car fully equipped is 26,000 lb. This brings the weight per passenger seat to 530 lb.

These remodeled cars have been in service for nearly two months and have proved their worth, especially when large crowds are handled. They have also been very satisfactory to the crews operating them. A second drawing shows a plan and elevation of cars after their reconstruction.

The Practical Side of Vacuum Car Cleaning—Layout

BY S. L. GUTHORN, E.E.

When distributing vacuum from a stationary plant for cleaning purposes, the principal factor which determines the outlet location is transmission losses in the hose. Not that the losses in hose vary greatly from those of pipe of corresponding size, but because convenience of operation and established practice always fixes the former as much smaller. Depending upon the selection of the diameter only, even within the province of standard lengths and sizes, the displacement losses vary from less than 25 per cent to more than 50 per cent.

The accompanying displacement versus hose length curves, their discussion and the conclusions therefrom, clearly establish the foregoing statements. Examining these curves for a few critical values, we note that of the 90 cu. ft. of air displacement at the hose outlet, there is available as free air at the end of 50 ft. of hose 70 cu. ft. if transmitted through a 1½-in. hose, or a loss of 22 per cent, i. e., 78 per cent is available; 62 cu. ft. if transmitted through a 1¼-in. hose, or a loss of 31 per cent, 69 per cent being available; 54 cu. ft. if 1-in. hose is used, or a loss of 40 per cent, 60 per cent being available.

At the end of 100 ft. of hose with the same initial displacement of 90 cu. ft. we note: 68 cu. ft. of free air for the 1½-in. size, or a loss of 24 per cent; 53 cu. ft. for the 1¼-in. size, or a loss of 41 per cent, and only 42 cu. ft. for the 1-in. size, or a loss of 53 per cent. Comparing these values, we note that in the case of 1½-in. hose an increase from a 50-ft. to a 100-ft. length causes only a loss of 2 per cent compared with a loss of 9 per cent for 1¼-in hose and of 13 per cent for 1-in. hose.

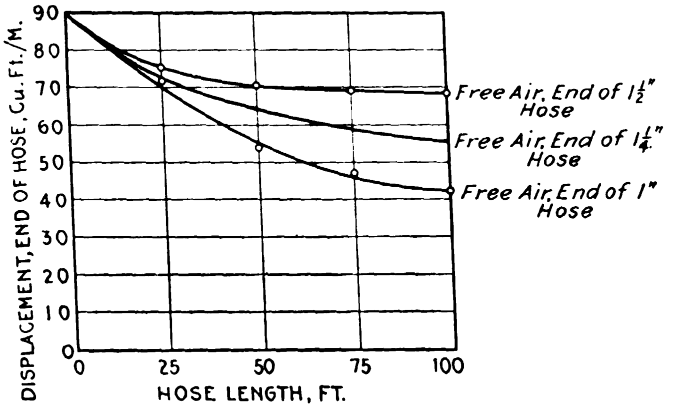
From these examinations we may conclude that for 1½-in. hose the loss for the first 50 ft. is least and that the increased loss due to an additional 50 ft. is negligible. Therefore good and uniform sweeping performance is assured under conditions of service where varying lengths of hose will be required. This is evident from the flatness of the curve. For 1¼-in. and 1-in. hose the loss in the first 50 ft. is greater and is too considerable for an additional 50 ft. length to be neglected, thus giving inferior service should variable lengths of hose be required.

These facts are within 5 per cent for all practical displacements. Larger sized hose has not been discussed because it is too cumbersome, it lacks mechanical strength when made in sufficiently light weights and it is not sufficiently flexible when strong enough. Smaller sized hose is absolutely inadmissible because the ordinary materials swept will obstruct it, the transmission losses are prohibitive and their variation with respect to length is too great to warrant uniform sweeping.

Where possible, in the pipe layout for car cleaning in shops, the distance between adjacent outlets should equal two car lengths, i. e., 100 ft. for 50-ft. cars. This will permit cleaning with a 50-ft. or 60-ft. length of hose and the cleaning of two cars or four cars if tracks are adjacent for each hose connection, thus saving the shifting of hose. It is also advisable to locate the first outlet of a series one car length from the bumpers. This will insure the outlets being in line with the platforms and will eliminate taking hose through the windows. Only one set of outlets is necessary for each two tracks. If local conditions require 100 ft. of hose for cleaning never use the 1-in. size.

The pipe layout should always be the shortest possible. This is invariably accomplished by extending the main longitudinally, with branches at right angles and parallel with the ties, rather than the reverse. Since this arrangement will not involve any additional pipe for an outlet for each track, the sufficient condition of one outlet for two tracks as above set forth may be doubled.

All piping should decrease in size as it branches out and extends from the exhauster, but no pipe should be less than 2 in. All deflections should be made by means of long-turn drainage fittings, plugged for cleanout, and so placed that the cleanout is trailing and not facing the material conveyed. A minimum pitch of 1 ft. in 50 toward the exhauster is desirable. The complete reaming with a reamer and not a file of all pipe ends is absolutely essential. If the condition of the soil will permit black pipe is preferable to galvanized, unless the latter is free from lumps of zinc due to early freezing of the bath.



RELATION BETWEEN AIR DISPLACEMENT AND HOSE LENGTH

For determining the capacity of plant necessary for a given shop, allow 3000 sq. ft. per hour per man, which for a car 50 ft. x 9 ft. allows six to seven cars per hour per man.

The cost of the plant will vary with the type of exhauster, method of separation and disposal of the materials swept, type of control and nature of current available. A reliable plant, complete and ready for operation, but exclusive of the piping, will cost from $500 per sweeper in a small plant to $400 per sweeper in a larger unit. Others may be purchased for half this price.

Terms have been agreed upon between the Italian government and the subconcessionary company constructing the Ambertide-Todi-Terni railway and the branch to Ponte S. Giovanni Perugia for the conversion of the system to electric traction. Instead of a subsidy of 7500 lire per km ($2,400 per mile) for seventy years, the government is to pay 10,000 lire ($3,200 per mile) for fifty years, and to accept 15 instead of 20 per cent of the profits. These modifications are induced by the special importance of the projected lines, and the advantages accruing to the public by their electrification.

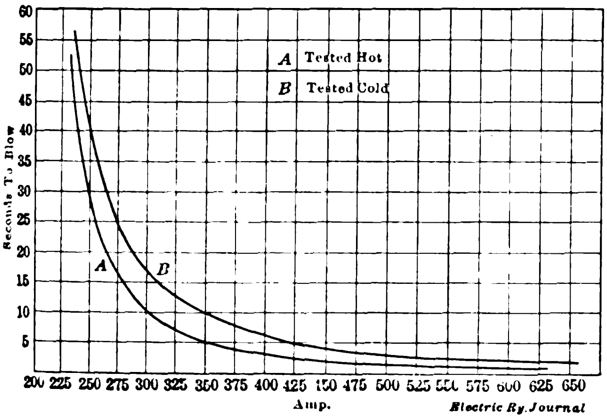
Equipment Defects—Fuses, Fuse Blocks and Fuse Boxes—I

BY C. W. SQUIER, E.E.

The electrical equipment of all cars should be protected by a device which will automatically open the circuit under abnormal conditions, as great losses may be caused by overloads or short-circuits. This automatic form of protection is, therefore, an exceedingly important one, and too much care cannot be exercised in its selection. Fuses are the most elementary type of devices for performing this function. At first they were made of metals with a low melting point such as lead, but as the capacities needed increased other metals such as zinc, copper and aluminum were found to be better adapted because a less volume of material is required to be melted when the fuse is blown.

OPEN FUSES AND INCLOSED FUSES

The first types of fuses were open and usually consisted of a porcelain block with terminals to which a piece of lead wire was attached. Such fuses have the objectionable features of the spattering of melted metal and the consequent fire hazard when they open the circuit; also they cannot be rated accurately or be depended on to blow uniformly due to the exposure of the fusible strip. To overcome these objections cartridge or inclosed fuses have been developed.



OVERLOAD TIME ELEMENT CURVES OF 150 AMP FUSES

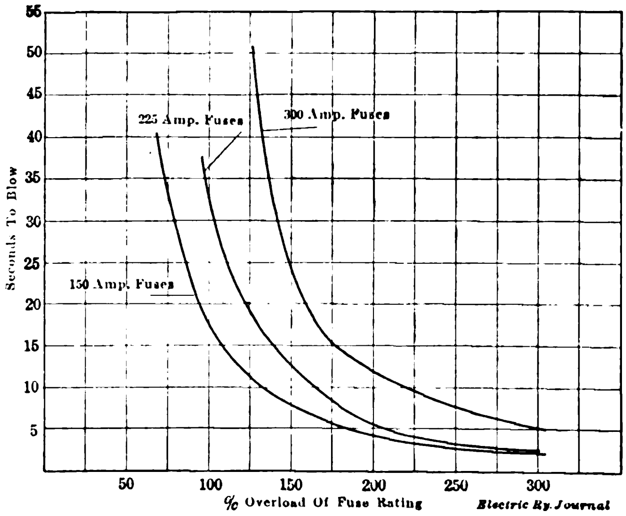
Inclosed fuses have the fusible element inclosed within a tube of fiber or paper which is filled with a refractory material to keep out the air and to aid in the breaking of the arc when the fuse blows. Suitable terminals are provided at either end for mounting the fuse easily and quickly in a fuse block. Each manufacturing company developed a line of fuses to its own dimensions. As a result fuses of the same capacities but of different makes had different dimensions. The different manufacturers also rated their fuses differently, some fuses being rated at their maximum carrying capacity while others were rated at about 80 per cent of this capacity.

STANDARDIZATION

The lack of uniformity in fuses resulted in much confusion. Finally standard dimensions and ratings were agreed upon at a conference which was held between representatives of the Underwriters' National Electric Association and the fuse makers. Fuses conforming with this standard are known as National Electric Code standard fuses, and all the principal manufacturers now make them. This standard divides inclosed fuses into classes according to their voltage and ampere capacity, and dimensions are specified for each class. Fuses are rated so that they will carry indefinitely a current 10 per cent greater than their rating; and with a current 25 per cent greater than that at which they are rated, they will open the circuit without reaching a temperature which will injure the fuse tube or the terminals of the fuse block. With a current 50 per cent greater than their rating and with a room temperature of 75 deg. Fahr., fuses starting cold must blow within the following specified times:

0-30	amp	1 min.
31-60	amp	2 min.
61-100	amp	4 min.
201-400	amp	12 min.
401-600	amp	15 min.

This standardization of fuses has been of great value to operating companies, and much credit is due the members of the Underwriters' committee and to the various fuse manufacturers for their co-operation. The dimensions of fuses were carefully worked out and are as small as it is safe to make them. The use of special dimensions for fuses, and particularly those smaller than the standard, should be discouraged.



CURVE SHOWING THAT TIME ELEMENT FOR FUSES LENGTHENS AS THEIR CAPACITY INCREASES

FUSE TESTING

To blow a fuse it is necessary to heat up the fuse metal to its melting point, and this takes a certain length of time depending on the amount of current passing through the fuse. This overload time element, or time lag, as it is commonly called, decreases rapidly as the current increases. One cut shows overload time element curves for some 150 amp 500-volt inclosed fuses. Two classes of tests were made; the first, shown by curve *B* starting with the fuses cold, namely, at the temperature of the surrounding air which was about 70 deg. Fahr.; the second, shown by curve *A*, was made after raising the temperature of the fuses to the degree of heat that they would reach in actual service on cars. Tests which had been previously made on fuses in service to determine what this temperature should be indicated that 170 amp flowing through the fuses continuously for 7¾ minutes would raise their temperature approximately the same amount as was obtained by the intermittent conditions of actual service. When tested cold, the time was taken from the instant the current was turned on till the fuse blew, this current being kept constant by means of a water rheostat. The tests of the fuses hot were made by placing 170 amp through the fuse for 7¾ minutes, then increasing this to overload conditions and taking the time from the instant the current was increased till the fuse blew. By referring to the curves it will be seen that these particular types of fuses will carry currents below 225 amp indefinitely, that they will open the circuit with 250 amp flowing in forty seconds when cold and twenty-eight seconds when hot, and also that with 400 amp through the fuses they will open the circuit in 6¼ seconds when cold and three seconds when hot.

The time element for fuses lengthens as their capacity increases. This is illustrated by the second set of curves, which show the time necessary for three different sizes of fuses to open the circuit with an overload a certain per cent of their normal rating. With 200 per cent overload these 300-amp fuses required twelve seconds to blow, to 5½ and four seconds respectively for the 225 and 150-amp fuses.

The Installation of Grid Resistors, Motor Leads and Fuse Boxes

BY R. H. PARSONS, ELECTRICAL FOREMAN

The accompanying sketches show arrangements of resistance, motor lead and fuse box connections to illustrate approved methods of installing these parts.

Fig. 1 represents a set of three-box resistors, suspended with iron hangers from the car floor or framework to which are fastened two wooden hangers covered with asbestos lumber. A sheet of ¼-in. asbestos lumber is placed below the wooden hangers, and the grids are attached under the asbestos by bolts through the wooden hangers. Care should be exercised to allow sufficient space between the grids and between the two outside grids and the iron hangers. The iron hangers should be grounded.

Fig. 2 illustrates the resistors and their conduit connections. It will be noted that the wires are separated as they leave the fiber cover of the condulet and that they touch nothing until they reach the terminal of the grid. As a rubber bushing lines the fiber outlet to the condulet, it is safe from grounds and short circuits.

Wooden Cleat

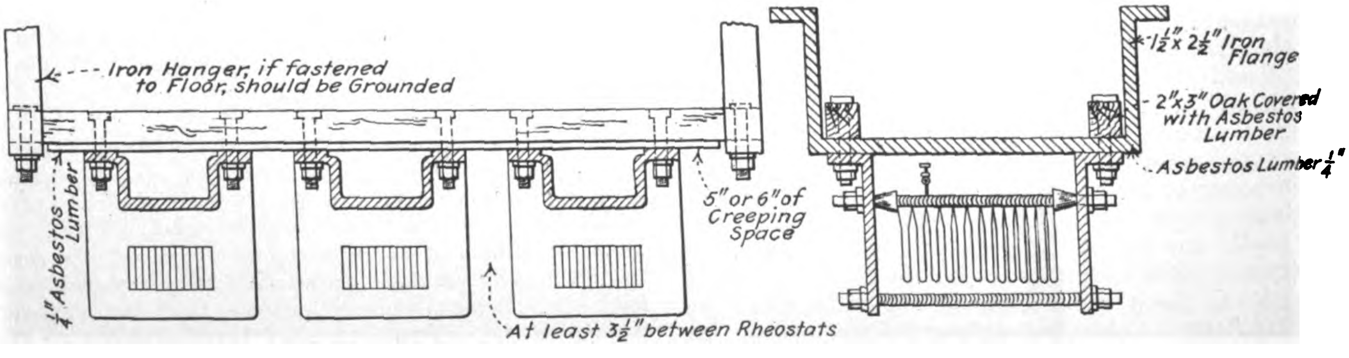
FIGS. 3 AND 4—TOP AND FRONT VIEWS OF SAFE ARRANGEMENT OF MOTOR LEAD CONNECTORS

Figs. 3 and 4 are top and front views of a good layout for motor lead outlets and connections. It consists of a condulet similar to the Type A with a fiber cover having two outlet holes. These holes are lined with a rubber bushing. At a point 2 in. out from the bushing the terminal is soldered on to the wire. At each side of the condulet, at intervals of 6 in., are fastened two flat iron brackets which extend for a length of approximately 12 in. A split cleat is bolted across the ends of these brackets to hold the wires securely. The connector receives a layer of friction tape, and a piece of circular loom cut to fill exactly the space between the condulet and cleat is slipped over the conductor, the whole



Iron Hanger, if fastened to Floor, should be Grounded

FIG. 2—VIEWS OF GRID RESISTORS SHOWING METHOD OF ARRANGING CONDUIT AND LEADS

making a well-insulated job which will not be affected even by water.

Fig. 5 illustrates a safe way to suspend a ribbon fuse box. The fuse box is first bolted to a hard wooden board, but with a layer of ¼-in. asbestos lumber intermediate. The board in turn is then bolted to the floor, platform framework or other convenient part of the car, with 2-in. wooden fillers between. This arrangement gives an air space between the fuse box and the board and between the board and the floor, enabling the parts to dry out quickly after they have been subjected to water. It also gives a sufficient insulation for the fuse box, the asbestos lumber affording protection in case a loose connection or heavy arc subjects the wood above to flame. It is also best to run the conduit which carries the wires not less than 4 in. or 5 in. from the fuse box.

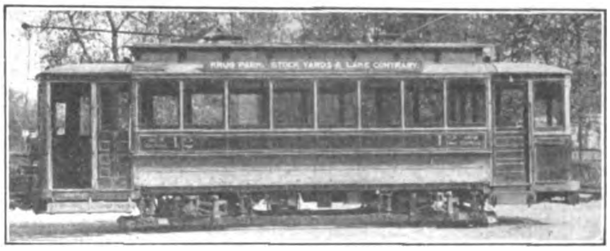
Radial Axle Truck Adapted for Sharp Curves

BY FRED STEFFENS, MASTER MECHANIC ST. JOSEPH RAILWAY, LIGHT, HEAT & POWER COMPANY

The writer has recently secured a patent on a radial axle, long wheelbase truck, of the type shown in the accompanying drawings and halftones. This truck was built in our shops and the latter part of April it was put under car No. 12. It made its first trial trip on April 30, when it was taken over all the worst tracks and curves in St. Joseph. Although the truck was new and rigid it did not refuse to go over any of our tracks. It entered regular service under car No. 12 on May 1 and has been in service ever since. The truck frame is 22 ft. 5 in. long over all. The wheelbase is 15 ft., which the writer believes is the longest ever built to run under a car successfully. This wheelbase was used because the car would not take a longer truck; otherwise the writer would have built the truck with a 16-ft. or 18-ft. wheelbase, as his design is adapted for lengths as great as 25 ft.

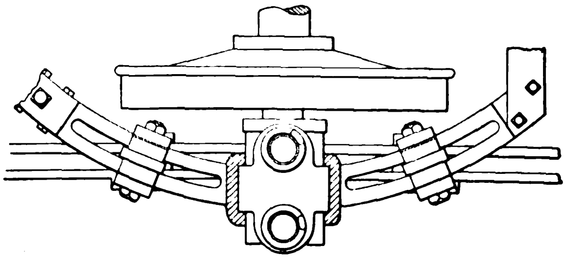
Car No. 12 is 22 ft. 8 in. over the corner posts, and 36 ft. 9 in. over the bumpers. Previously it was mounted on an 8-ft. wheelbase Dupont truck. Thus the overhang and the oscillation were so great and the swing was so heavy when it entered a curve that very unsatisfactory service followed, but the use of a radial axle truck makes it ride as steadily as a double-truck car.

This truck is equipped with a curved horizontal frame which nearly encircles each axle, as shown in the drawings. At the intersection of this curved frame and the normal position of the axle, the frame carries an inverted "U" member which can slide vertically outside and above the adjacent journal box. On each side of the journal box the curved frame is provided with concave runways on which rollers are mounted. Normally these rollers rest in the lowest portions of the runways, but when the trucks turn a curve they run up the runway for a distance proportional to the degree of curvature. Gravity tends to return the rollers to the lowest positions when the trucks return to straight track.



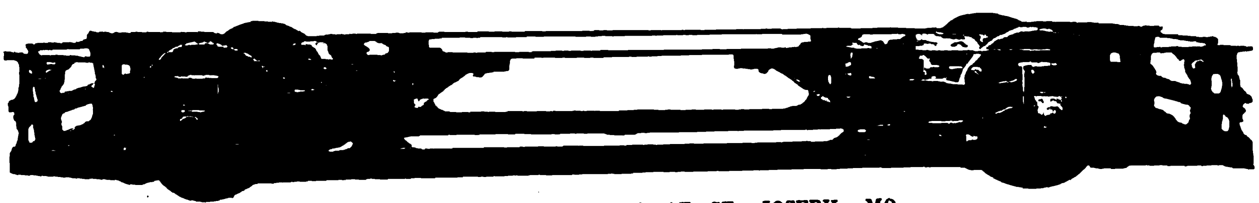
ST. JOSEPH CAR WITH RADIAL AXLE TRUCK ON CURVE

However, to assure the prompt return of the axles to their proper position each truck has a supplemental spring actuated mechanism of the character shown in the plan view. It will be seen that the middle point of the circular frame carries a lever which is pivoted on a vertical pin. At the other end of this lever are two mounted friction rollers against which two leaf springs bear. These springs are secured to an angle bar and press toward each other, thereby resisting the movement of the lever from the central position. After the car wheels have turned a curve and are on a straight track the springs assist the hanger rollers to return the axle and car wheels to their proper position. In going up or down grades the leaf springs insure the proper positioning of the axle relative to the frame in case the runway rollers alone do not effect this function.



DETAIL OF ROLLER MECHANISM AT JOURNAL BOX

While in this particular truck the car body supporting frame connects the two pairs of wheels, it will be readily seen that each pair of wheels are in a frame by themselves. They could be separated by leaving out the center top and bottom plates, and continue to work



RADIAL AXLE TRACK USED AT ST. JOSEPH, MO.

just as well if not better in case a wheelbase longer than 14 ft. is used. This radial truck should supersede all other single or double trucks for two-motor equipments, for since it permits the weight of the motors to be carried on two axles instead of four it gives better propelling power and therefore less skidding, spinning and energy consumption.

This truck has the best brakes on our system, although we have several kinds of brakes. We use many types of single trucks, double trucks and maximum traction trucks. Some of these have very good brakes, but none that will compare with the brakes on this truck. Car No. 12 is equipped with National straight air brakes and two GE-80 motors. This truck is unlike other radial trucks now in use. In the others the wheelbase has been lengthened from 8 ft. to 10 ft. and 12 ft. This does away with the oscillation, but introduces a snake movement which is worse than the oscillation. The writer's truck does away with all undesirable movements.

Diesel Electric Cars in Saxony

The Saxon State Railways have had constructed two Diesel electric motor cars, which they propose to try on the line between Dresden, Coswig and Meissen, for passenger traffic. The cars have been built by the Rastatt Works, and the Diesel equipment supplied by Sulzer Bros., Ludwigshafen, while the electrical equipment is by the Brown Boveri Company, Mannheim. The Diesel motor is of the six-cylinder type, of 200 to 250 hp, at 400 to 450 r.p.m. Coupled direct with the motor is a d.c. dynamo of about 190 hp, which supplies energy to the motors, of which there are two, each wound for 300 volts. The car is on two trucks, one of which has three axles and the other two axles. The Diesel motor and the dynamo are carried on the three-axle truck and the working motors on the two-axle one. At each end of the car are third-class compartments with accommodation for ninety passengers, as well as cabs for the driver. The car weighs about 70 tons. It is able to run at a speed of 43.4 m.p.h. on the level, or to haul a trailer at a lower speed. The car is fitted with the Westinghouse two-cylinder air brake. For electric lighting a battery is provided, charged from the dynamo. The Diesel motor cylinders are water-cooled, the heated water being discharged in summer, but in winter it is passed through tubes to heat the car.

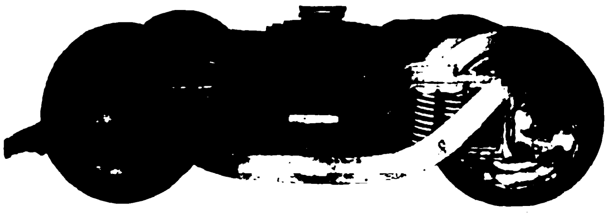
Electric Motor Trucks for City and Suburban Service

There are few classes of electric railway service in which rolling stock is subjected to conditions more severe than those found in city and suburban work. Among the causes contributing to this are excessive overloading, frequent starting and stopping, accompanied by rapid acceleration and heavy brake applications, and shocks caused by frequently passing over switches and crossings. The brunt of all this must be borne by the trucks, which should be of light weight in order to reduce energy consumption as far as possible, but which must at the same time be of ample strength to stand up with a minimum expense for maintenance.

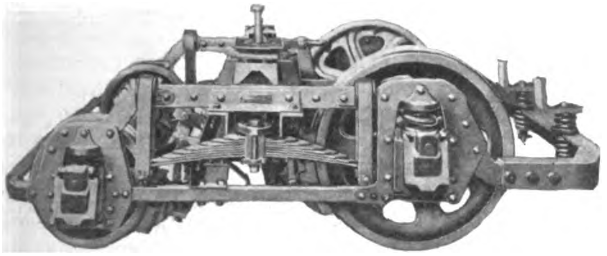
The illustrations show two types of Baldwin trucks which are specially fitted for work of this character. The truck for the Conestoga Traction Company represents the type built by the Baldwin Locomotive Works for city service where a single motor equipment is desired. This truck has a carrying capacity of 14,600 lb. on the center plate, and is operated at speeds up to 30 m.p.h. The track gage is 5 ft. 2½ in., and the sharpest curves have a radius of 32 ft. 6 in. The truck wheelbase is 54 in. The motor is outside-hung, and is spring-supported on a piece of angle iron which extends across the truck and is bolted to the side frames. The latter are supported on coil springs placed over the journal boxes, while the bolster is supported on two half-elliptic springs which are hung from the side frames by swing links. The driving and pony wheels are of chilled cast iron, their respective diameters being 33 in. and 21 in., while the journals measure 3¾ in. x 7 in. and 3 in. x

6 in. Commercial shapes are used as far as practicable, in this type of truck; and the simplicity of its construction and the ease with which it can be repaired commend it for service where severe conditions must be met.

The truck for the Philadelphia & Garrettford Street Railway is used in suburban service, running at speeds up to 40 m.p.h. This truck is of the equalized pedestal type without end frames. The transom gussets are of sufficient strength to hold the frames square and prevent diamond pointing. Equalizing beam springs of the twin helical pattern, and double elliptic bolster springs insure excellent riding qualities. A special feature of this truck is an angle-iron brace at one end, which is secured to the pedestals to support the sand pipes. This truck is built for a track gage of 5 ft. 2¼ in. The wheelbase is 78 in., and the wheels are of solid rolled steel, 34 in. in diameter. The journals are 4¼ in. x 8 in. The carrying capacity on the center plate is 21,100 lb.



TRUCK FOR PHILADELPHIA & GARRETTFORD STREET RAILWAY FOR SUBURBAN SERVICE UP TO SPEEDS OF 40 M.P.H.



TRUCK FOR CONESTOGA TRACTION COMPANY WITH CAPACITY OF 14,600 LB. ON CENTER PLATE

Reverse-Power Relays for Protection of Parallel Feeders

The need for a reliable reverse-power relay has been appreciated for a long time, particularly in substations fed by parallel feeders. In case of a short-circuit or ground on one feeder a selective reverse-power relay that will not operate on overload is the only means for completely isolating the feeder, the reversal of power at the substation end causing the relay on the defective line only to operate. The accompanying diagram explains this.

The diagram shows two parallel feeders from the generating station to the substation. For simplification, the layout is single-phase, but three-phase operation is similar when three relays are so connected that voltage and current are in phase in each relay. At the generating station are plain overload relays, set for a comparatively long-time element. At the substation are two sets of Westinghouse selective reverse-power relays, one set for each feeder. When the direction of power is normal, both feeders supplying power to the substation, the reverse-power relays cannot trip their breakers no matter how heavy the load may be.

If a ground or short-circuit occurs at *D* on feeder No. 1 a heavy current will be caused on both feeders, for feeder No. 2 will supply power through the substation and back on feeder No. 1 to the point of short-circuit. Thus the direction of power is reversed at relay *B* in the substation. This reversal of direction of power is the only thing that can cause relay *B* to operate. As soon as circuit-breaker *F* is opened, the load on feeder No. 2 falls back to normal, and it continues to operate the substation.

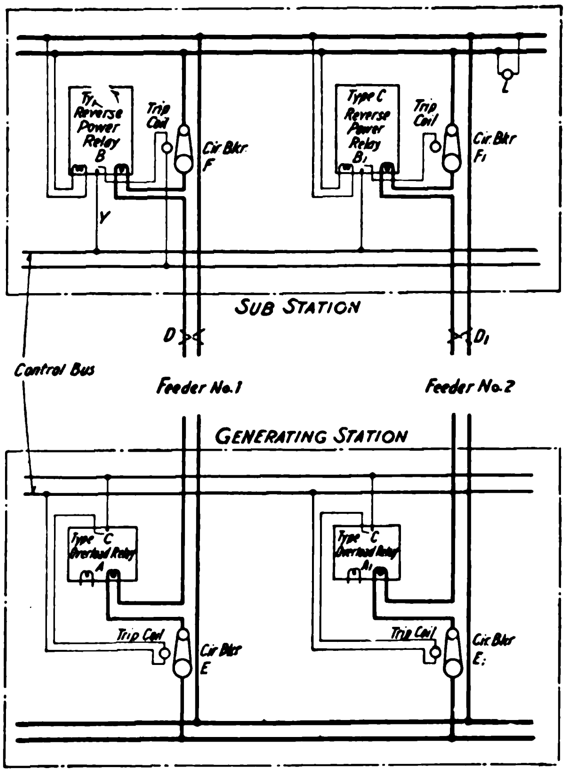


DIAGRAM OF CONNECTIONS OF RELAYS FOR PROTECTING PARALLEL FEEDERS

This condition is effected in approximately two-fifths of a second after the short-circuit occurs. If the short-circuit continues the overload relay *A* in the generating station will trip its breaker and the line is clear. Similarly, if a short occurs at D^1, reverse power at B^1 will trip the breaker F^1, and an overload at A^1 will trip its breaker. In case of a heavy short-circuit near the substation, the voltage may drop very low, but these relays are so sensitive that they will operate correctly even if the voltage drops to 2 per cent. The Westinghouse Electric & Manufacturing Company furnishes reverse-power relays especially for this purpose.

An interesting experiment to prevent overcrowding was tried recently by the District Railway Company of London on a train leaving Ealing Broadway for the Mansion House. Because of constant growth in passenger traffic the number of trains has been increased, and an extra coach, labeled "Mansion House only," has been added. As the trains, with the added coach, were too long to draw up at the platforms of most intermediate stations, the last coach stopped in the tunnels at the entrance to stations. A special guard is attached to each "Mansion House" coach. If successful, the innovation will probably be extended.

Poles for the Chicago, Milwaukee & Puget Sound Electrification

A tangible sign of the approaching electrification of the Chicago, Milwaukee & Puget Sound Railway, concerning which a statement was published in the ELECTRIC RAILWAY JOURNAL for Jan. 3, 1914, is the shipment of the 45-ft. red cedar poles which will carry the 100,000-volt transmission line of the Great Falls Power Company.

The order calls for 2705 45-ft. and 255 50-ft. poles for use on the transmission lines proper. In addition to this the railway is using 3625 6-in. top 25-ft. poles for a telephone line paralleling the transmission line. All of these poles are being shipped from the Priest River, Idaho, yards of the pole contractor, Lindsley Brothers Company, Spokane, Wash. Every pole is treated with Avenarius Carbolineum by the open-tank process, the immersion lasting for fifteen minutes at a temperature of approximately 200 deg. Fahr. The 25-ft. poles are treated for 6 ft. of the butt and the 45-ft. and 50-ft. poles for 8 ft. of the butt.

New All-Steel Cars for the Albany Southern Railroad

Two 51-ft. all-steel arched roof, combination passenger cars of the neat design shown in the accompanying illustration have been recently placed in service by the Albany Southern Railroad, Albany, N. Y.

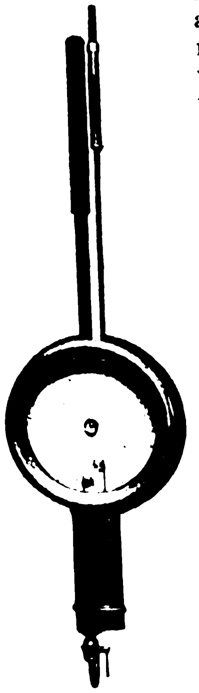
The cars, manufactured by The J. G. Brill Company, are mounted on Brill 27-A trucks which are equipped with third-rail brackets and paddle shoes of the General Electric type. The wheels are of 34-in. diameter solid rolled steel. Brakes are of the Westinghouse straight-air type with 12-in. brake cylinder, type M L slack adjuster and P. V. brake valves. All car wiring is in conduit.

The switches are installed on an inclosed panel board inside the smoking compartment. The cars are lighted with fifteen 23-watt tungsten lamps equally spaced on each side.

The seating capacity per car is sixty-two. The seats in the main compartment are of the reversible type with high back and arm rest and with Pantasote covering, while the longitudinal seats in the smoking compartment are of rattan. The floor is of wood and double, and the ceiling is of agasote painted in light green. The interior is finished in a dull cherry. The exterior is of Pullman green and striped and lettered with gold leaf. Other equipment for these cars includes Brill ventilators, Van Dorn No. 6 couplers, Ohio Brass air sanders and double-spring roller bearing trolley bases, GE trolley poles, the Universal Trolley Wheel Company's trolley wheels and Earll No. 7 trolley catchers.

Combined Recording Barometer and Vacuum Gage

One of the most important factors in the economy of steam consumption for power purposes is the absolute back pressure. To reduce this back pressure to a minimum is the office of the condenser, and it is, therefore, most desirable if not absolutely necessary to keep close watch on the condenser. For this purpose vacuum gages and recorders are installed.

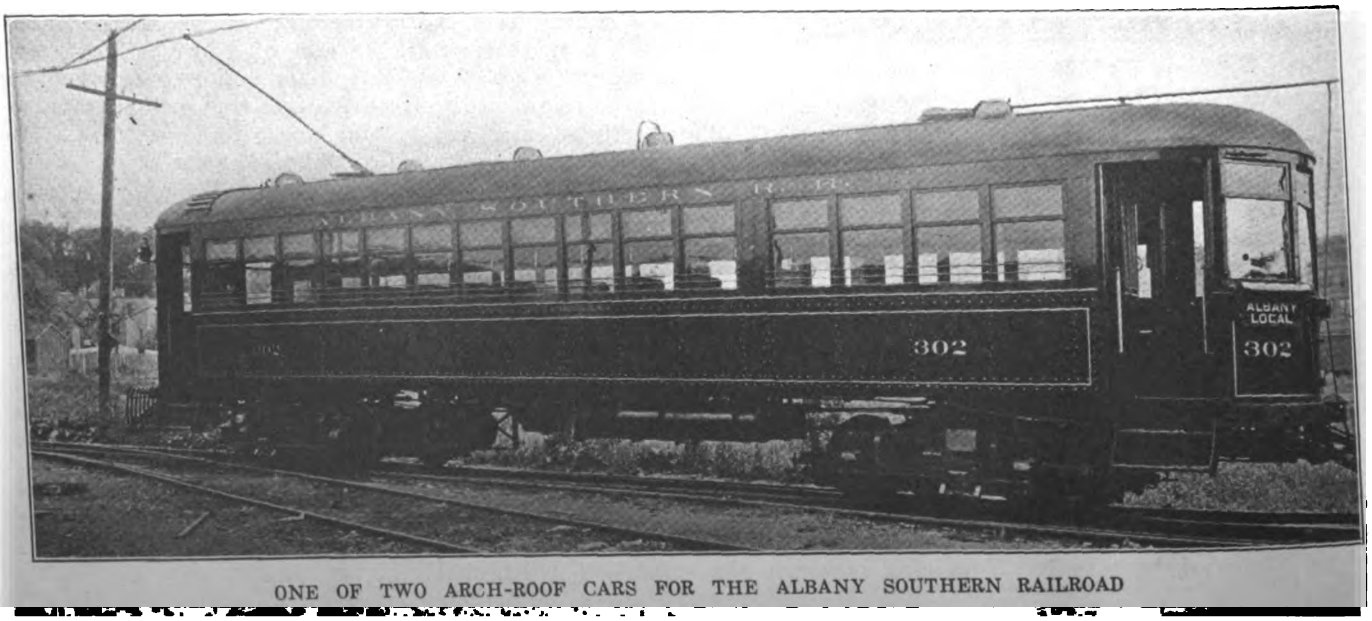


DUPLEX PRESSURE RECORDER

The ordinary vacuum gages and recorders, however, do not indicate or record the back pressure directly nor correctly. The vacuum as recorded varies with the barometer at the same time and place, whereas the absolute back pressure in the condenser is independent of the barometric pressure but is always equal to the difference between the two. The nearer the vacuum approaches the barometer, the lower the back pressure and vice versa.

The Uehling combined barometer and vacuum recorder of the Uehling Instrument Company, Passaic, N. J., has been developed to put these two records in juxtaposition on the same chart. With the barometer record used as the base line the absolute back pressure can be correctly read off directly from the chart. The device consists of two float chambers, one connected with a barometric mercury column, the other with a mercury column in communication with the condenser. These columns and double-float chambers are secured to the case of the recorder.

The pens of the recorder are actuated by the floats and move in correct harmony with the barometric pressure and the vacuum.



ONE OF TWO ARCH-ROOF CARS FOR THE ALBANY SOUTHERN RAILROAD

LONDON LETTER

(From Our Regular Correspondent)

The traffic analyses of the past few weeks have proved that the new moving stairways at Charing Cross and Oxford Circus are a success, and plans for the construction of additional stairways are being advanced as rapidly as possible. The Metropolitan and Bakerloo lines will be linked at Baker Street in about three months, and other moving stairways are contemplated at Oxford Circus (to connect with the Central London Railway), Shepherd's Bush, the Bank and Piccadilly Circus. The Underground Railway managers are somewhat baffled by the problem of utilizing the old lift wells and sections of tube left derelict by the installation of the stairways.

In consequence of the conditions imposed by a committee of the House of Commons in connection with the bill promoted by the Great Northern and Metropolitan Railway Companies for the acquisition and joint operation of the Great Northern & City Railway, and for its extension to the Bank station of the City & Waterloo Railway, the scheme has been withdrawn. This tube suffered from a lack of adequate provision to insure its proper co-ordination with other railways. The original intention was to have a physical connection between the tube and the Great Northern Railway near Finsbury Park. With this object in view the tube was built much larger than any of the other London tubes in order that it might admit the Great Northern rolling stock. The completion of this plan, however, had not been adequately secured, and a compromise was arranged by the tube terminating under Finsbury Park station. The working of the new railway was thus hampered from the very outset. Its large size had increased the cost of construction and equipment and made its trains more cumbersome than those of other tube railways, and it was getting no compensation for this in the way of interchange of traffic facilities. Its sale to another railway was a natural solution of its difficulties. The Great Northern seemed the most suitable purchaser, and much surprise was caused the year before last when the Metropolitan Railway purchased the tube. The proposed acquisition met with strong opposition from a large body of the Metropolitan shareholders, most of whom, however, were mollified when informed of the directors' plans for the line. Since the purchase was completed, however, these plans have failed to receive Parliamentary sanction.

At the ordinary general meeting of the Imperial Tramways, the chairman, Sir George White, in referring to the accounts, made some striking statements with regard to the future of motor omnibuses in connection with tramway enterprises. Some time ago this company considered the question of introducing motor omnibuses where it was considered they could be used as feeders to the tramways. A number of these vehicles were put in service on the streets of Middlesborough to the great satisfaction and benefit of the public. The company has secured a large building, formerly used as a skating rink, which is being made the headquarters for a motor department. Sir George White said that public requirements could no longer be met by tramcars alone. His company's experience in Bristol showed that, notwithstanding the smaller carrying capacity of the motor omnibus, the receipts per mile on city and country regular services alike actually equalled the receipts per mile of the tramway cars, while the touring car receipts were 70 per cent more per mile than the tramway car receipts.

As a commentary upon the above paragraph, a few words regarding the West Ham Corporation Tramways are appropriate. This year there is a deficit of more than £14,000, as compared with a deficit in the previous year of slightly more than £3,000, whereas for the year ended March, 1912, there was a surplus of £4,000. The whole of this deficit is attributed to the motor omnibuses now run by the London General Omnibus Company.

The accounts of the Wolverhampton Corporation's electric tramway system are always interesting, as showing the results of the only surface contact system in Great Britain. The results this year are again most satisfactory, although they are now being amplified by those of a motor charabanc service, instituted about three years ago. The average traffic revenue per car mile reached 11.3d., and the working expenses, including power cost, 6.6d. Including renewals, the total expenses per car mile averaged 9.8d., leaving a substantial balance of profit.

To mark the completion of twenty years' operation of the Glasgow Tramways under the management of the Corporation, 104 tramwaymen, who have been in service for that period, were presented with silver badges. Councillor Kirkland, convener of the Tramways Committee, said that in July, 1894, when the tramways were taken over by the Corporation, there were 538 conductors and drivers employed, while at the present day there were 3200 motormen and conductors in the service. Sir James Bell, who was Lord Provost in 1894, said that at that time many people foredoomed the enterprise to failure, but that to-day the tramways were bringing in a large revenue and the service was probably unequalled.

In pursuance of the policy of educating the public in methods of safety on the streets, the Glasgow Corporation Tramways recently displayed on the cars a large placard headed "Always Face Forward," and bearing the Scripture reference "Proverbs, Chapter 3, 23." This was one of a series of weekly texts affixed to the city cars. The verse to which attention was directed reads as follows: "Then shalt thou walk in thy way safely, and thy foot shall not stumble."

The Tramways & Light Railways Association held a two days' conference in Newcastle last month and some interesting papers were discussed. Councillor R. Mayne, vice-chairman of the Newcastle Tramways' committee, read the first paper, his topic being "Features of the Newcastle Corporation Tramways." Other subjects were: "Tramway Experiences in Brazil," by H. M. Sayers; "Standard Tram Rails: A Comparison of English and Foreign Sections," by F. Bland; "Rail Joints: Their Construction and Maintenance," by R. Humphries, of the Birmingham and Midland Tramways joint committee; and "Town Planning in Relation to Local Traffic," by J. A. Brodie, city engineer at Liverpool.

The directors of the British Electric Traction Company, which operates numerous tramway systems in England, have prepared a scheme for the reduction of the company's capital. When the capital was rearranged in 1911-1912 there was no reduction, but the further accumulation of unpaid dividends on the preference shares was arrested. The sum of £908,372, by which it is now proposed to reduce the capital, will, with the existing reserve, fully cover the depreciation in the assets. The amounts now proposed to be written off are 50 per cent of the 6 per cent preferred ordinary stock and 70 per cent of the deferred ordinary stock. The new share capital will consist of two classes of stock only, viz., 6 per cent cumulative preference stock, with priority as to capital, and ordinary stock entitled to all surplus profits and assets.

The select committee of the House of Commons considering the London, Brighton & South Coast Railway bill has decided that the terms of contract for the supply of electricity shall be submitted to the London County Council, which has the power to purchase the electric companies in 1931. The railway thought that the County Council should have no voice in the matter before 1931. The committee has further decided that the railway shall have power to use, but not to sell, its electricity in Croydon, but that the use shall be limited to traction and station lighting. The corporation, as the authorized distributor, objected to another distributor offering a supply of electricity for sale in Croydon.

The work of electrification has progressed so far on the Kingston route of the London & South-Western Railway that delivery of the electric trains intended for the new service is now being made. The first of these trains is already under test upon the District Railway. This train, which consists of three cars, will carry 190 passengers. The coaches are of the compartment type. There is no intention of copying the big open compartments adopted on the tubes, which have never been popular with the average Englishman. The work of electrifying the South-Western service is making rapid progress. The company will not wait for the completion of the electric power station which it is erecting outside Earlsfield, but will, in the first instance, obtain its electrical power from an outside contractor.

A. C. S.

News of Electric Railways

Hearing by California Commission on Solano Project

Further details in regard to the hearing by the California Railroad Commission regarding the Solano land project, in which moneys of the United Railroads of San Francisco were invested by Patrick Calhoun, are now available. The article in the issue of last week was based upon telegraphic advices.

The testimony at the hearing indicated that the funds taken by Mr. Calhoun from the treasury of the United Railroads were withdrawn on receipts said to have been authorized by him and signed by him or in his behalf by certain employees of the company, for amounts varying in size. The treasurer of the company testified that it had been his custom to honor calls of this kind from President Calhoun. He did not suspect any impropriety and carried the payments as cash because they were cash items. Several directors of the United Railroads testified that they knew nothing about the transactions until June, 1913. The testimony was not clear or conclusive as to whether or not all of the $1,096,000 involved in the transaction was invested in the Solano Irrigated Farms project. As the commission took the position that it was unable legally to go into the affairs of the Solano Irrigated Farms, Jesse W. Lilienthal. president of the railway, agreed to do what he could to discover the sources of the money contributed to the enterprise. The hearing has been adjourned to Aug. 14.

As this transaction was placed upon the company's books at a memorandum value of $1 prior to the publication of its balance sheet of a year ago—June 30, 1913—any recoupment that the company may make from the Solano affair will add to its surplus. It is understood that the financial position of the company actually remains unchanged.

Mayor Blankenburg Appoints Utility Experts

With the approval of his co-workers, including the Mayors of New York, Chicago, Cleveland and other cities, Mayor Blankenburg of Philadelphia on July 23 appointed eight men of nation-wide prominence as members of the board of trustees of the National Bureau of Public Utilities Research. This body, as noted in the ELECTRIC RAILWAY JOURNAL of July 4, was suggested by Mayor Blankenburg to the heads of other cities in this country as a means for assisting in the efforts of cities to obtain lower rates from lighting, transportation and other public utilities.

The men selected and their qualifications are as follows:

Louis D. Brandeis, lawyer, Boston; counsel for Interstate Commerce Commission on application of Eastern railroads for 5 per cent increase in freight rates.

Charles R. VanHise, president University of Wisconsin, Madison, Wis.

S. S. Fels, manufacturer, Philadelphia.

Frederick W. Taylor, consulting engineer, Philadelphia; past president American Society of Mechanical Engineers; leader in scientific management movement.

Frederick A. Cleveland, director New York Bureau of Municipal Research; formerly chairman of the President's commission on economy and efficiency.

Leo S. Rowe, professor of political science University of Pennsylvania, Philadelphia; president American Academy of Political and Social Science.

Charles F. Jenkins, publisher, Philadelphia; proprietor of the *Farm Journal.*

Felix Frankfurter, administrator and lawyer, Cambridge, Mass.; professor of law Harvard University; chief legal adviser of the Colonial Administration of the United States under Presidents Roosevelt, Taft and Wilson; played important part in trials of Morse, Heinze and the Sugar Trust.

M. L. Cooke, director of public works, Philadelphia, is quoted as follows:

"The board appointed by Mayor Blankenburg voluntarily to perform this work has been chosen with the idea of securing the services of men who have made notably successful records for themselves, but who are known all over the country as being enlisted beyond the chance of recall in the battle for decency in government and fair dealing in private affairs. Not one of the members is in politics, nor is one of them at the present time a holder of any elective or political office. Their names will guarantee to all cities, and to the customers of utility corporations throughout the country, that the work of the bureau will be pushed with vigor, balanced by experience, and that its activities will have the necessary effectiveness."

It is stated that Mayor Blankenburg will increase the membership of the board by the addition of three or more experts in the near future. According to Director Cooke, the utilities bureau is now ready for business. Such a temporary administrative staff as may be needed to carry on its work between now and Nov. 12, 13 and 14, when the conference of Mayors will be held in Philadelphia, has now been provided. In addition to gathering general data, individual cities will be advised and assisted in making such application of the bureau's researches to local conditions as will be most likely to secure favorable consideration from public service commissions and other similar bodies.

Municipal Ownership Election Injunction Denied

Judge Stephen Young, of Norwalk, Ohio, sitting in Common Pleas Court at Toledo, on July 28 denied the application of John Craig, a taxpayer, for an injunction against the election for municipal ownership of the street railway properties at Toledo, which is set for Aug. 4. The court sustained the demurrer of City Solicitor Thurstin and held that it has no jurisdiction in the premises. John Craig is the nominal plaintiff in the case, although the Citizens' Franchise Association really brought the action, as noted in the ELECTRIC RAILWAY JOURNAL of July 25. It was decided to carry the case to the Court of Appeals at once.

The arguments were completed on the evening of July 27. Judge John H. Doyle, a member of the Citizens' Franchise Association, presented the principal argument for the plaintiff. He asserted that the petitions to initiate the ordinance were filed under neither the old nor the new law. The new law went into effect, he said, on June 8, 1914, while a copy of the petitions, required by the new law, was certified to the city auditor on May 22. If the petitions were legal under the old law, the board of elections had no authority to issue a call for a special election. Neither did the board have authority to call an election under the new law, because the certified copy of the petitions, being filed before June 8, was of no effect and because the signed petitions were not properly certified by the auditor to the board.

W. W. Campbell made the general defense that the 1913 initiative and referendum law was in full effect until the amendatory law went into effect, and that the petitions started under the old law could not be suspended by the new law. The certification of the ordinance to the solicitor was merely an extra precaution in anticipation of the new law, and was not really necessary to make the petitions valid.

Meetings are being held nightly by the Municipal Ownership League. The objections to the municipal ownership plan, as indicated by discussions of the subject, are to the effect that the ordinance is crude in its requirements and in its wording. It has been decided to ask the election board to print the entire ordinance on the ballots.

The franchise committee of the City Council, in session on July 22, deferred action for a week on the sliding scale proposal submitted by the Non-Partisan League. Nothing of importance has yet developed along this line, although both this proposal and that submitted by the Toledo Citizens' Franchise Association were discussed to some extent. After the meeting on July 22 Mayor Keller said that the committee might modify its own proposal and that some fixed rate of fare other than three cents might be considered. He would not go into details, however, and further information along this line was not obtainable.

Mayor Keller on July 24 issued a proclamation calling attention to the election to be held Aug. 4 to pass on "an ordinance to provide for the ownership and maintenance of and operation by the city of Toledo of street railways, electric lighting plants, electric power plants and artificial power plants and public utilities."

Wage Increase in Kansas City

The 3500 employees of the Metropolitan Street Railway, Kansas City, Mo., will, beginning with Aug. 1, receive 1 cent an hour more pay than heretofore, as the result of a recent order issued by Federal Judge William C. Hook. The order, dated July 20, was filed several days later. It covers all employees working upon an hourly basis in the operating, electrical, mechanical and maintenance of way departments, and the increased cost resulting will amount to between $110,000 and $125,000, according to an estimate by the receivers of the company. While the order came from Judge Hook, it was made at the instance of the receivers, as an indication of appreciation of the employees' loyalty during the recent campaign for an extension of the franchise. The company is now working out the details of the wage increase.

The receivers for the company agreed recently to extend to Kansas City, Kan., the half-fare rate for children between the ages of eight and twelve, the use of which began in Kansas City, Mo., on July 20, as noted in the ELECTRIC RAILWAY JOURNAL of July 25. The franchise on the Kansas side provides that any reductions made in Missouri shall be extended to Kansas. The petition asking for the extension was signed by the Kansas City officials and the receivers and forwarded to Judge Hook, who is expected to grant the request without delay.

Much interest was created when the Metropolitan Street Railway, in announcing through the daily papers that the half-fare rate for children was in operation in Kansas City, Mo., selected the Nelson papers, the *Star* and the *Times*, as two of its advertising mediums. Those dailies fought bitterly against the recent franchise granted to the Kansas City Railways, the successor company to the Metropolitan Street Railway. Advertising men were especially interested in the situation, in view of the fact that it is usual for advertisers to patronize the papers which maintain at least noncommittal attitudes regarding projects in which they are interested.

The Kansas City election board announced that a hearing on alleged frauds in the recent franchise election would be held on July 23. The investigation was to be directed particularly to the twelfth precinct of the First Ward, where the vote was 245 to 5 in favor of the franchise. The announcement followed a meeting of the board at which the the names of twenty-three men were presented who were alleged to have said they voted against the measure. It was stated that subpoenas for the judges, clerks and challengers who served in the precinct and for each of the twenty-three voters would be issued.

Merchants and property owners of the downtown district of Kansas City, Mo., have pledged $400,000 of a $500,000 fund to build an interurban station at Tenth and Wyandotte Streets, if the new management of the street railway system will accept that location. It is stated that this location is adjacent to the heart of the shopping district, is accessible from street car lines and offers the least grade of any of the sites proposed. New members have been added to committees to raise the additional $100,000 within the next ten days.

Pittsburgh Wage Arbitration Ended

The arbitration proceedings in the dispute between the Pittsburgh (Pa.) Railways and its employees, noted in the ELECTRIC RAILWAY JOURNAL of July 18, came to a close, as far as the taking of testimony is concerned, on July 20. During the ten days of the hearing the attorneys for the employees of the company introduced more than seventy witnesses, whereas the railway attorneys offered the testimony of only eleven witnesses. The testimony during the latter part of the investigation dwelt with the subject of minimum wage, new uniforms, dinner-hour relief and the character of runs.

George C. Wilson, attorney for the railway, announced his closing argument would be that the wages now paid the employees are too high and in view of the testimony introduced concerning the cost of living in Pittsburgh should be reduced. Mr. Jones, general manager of the company, testified that the employment office of the company was closed from March 17 to June 9 because the company had a sufficient number of employees. He also stated that the company has twenty-five employees who have been in the service for twenty-five years or more.

By the aid of a chart that he had devised Mr. Jones explained how the scheduling of cars will be rearranged so as to give better service and incidentally grant the men more free time at noon and a general improvement in working conditions. According to Mr. Jones' plan, the men are to have one and one-half hours for dinner and the company will pay them for thirty minutes of that time. At present the company handles 31,000 cars in the morning rush hours, 6000 at noon and 28,000 at night, all within half an hour.

Electric Railway Issue in Detroit Election

That the railway issue will again be brought up in the Detroit mayoralty campaign is indicated by the petitions which have been filed by candidates for that office. Mayor Marx, in the course of whose administration the seven-for-a-quarter day-to-day agreement with the Detroit United Railway was effected, is a candidate for renomination on the Republican ticket. He will be opposed by John McVicar, who, it is stated, is to run on a municipal ownership platform. F. F. Ingram, who has announced his candidacy on the Democratic ticket, is also running on a municipal ownership platform, charging Mayor Marx with a surrender to the Detroit United Railway and with the betrayal of municipal ownership.

The appraisal of the railway within the city is proceeding as rapidly as possible under the direction of Prof. E. W. Bemis. Edward Burch, chief assistant to Professor Bemis, in his first report states that the organization required for the appraisal is complete. With 33 engineers at work he expects that the work will be completed within the three months specified in the contract.

Andrew Sangster, public accountant, has been retained by the Board of Street Railway Commissioners to assist in the appraisal of the railway. He will be assisted by eight public accountants. The purpose of examining the company's books is to determine from the vouchers and other records the original cost of the property. Mr. Sangster has previously been connected with the appraisal of the Chicago Telephone Company, the Southern Bell Company, the Omaha Gas Company, the St. Paul Gas Company and the Springfield (Ill.) Gas Company.

Dual Subway Progress in New York

The Public Service Commission for the First District of New York during the week ended July 25 opened bids for the construction of one section of new rapid transit railroad and held a public hearing on the proposed form of contract for the construction of another. Bids were received for the construction of Section No. 5 of Routes No. 4 and No. 36, this being a part of the Broadway-Fourth Avenue subway in Manhattan. This section extends eastward from Fifty-ninth Street and Seventh Avenue to Fifth Avenue, where it divides into two branches, one branch continuing through Fifty-ninth Street and the other through Sixtieth Street to Second Avenue. It will be a two-track section, with stations at Fifth Avenue and Lexington Avenue. According to the unofficial report of the bids, the Degnon Contracting Company, New York City, was the lowest bidder at $2,808,661. The work in this section must be completed within twenty-nine months from the execution of the contract.

The section on which the public hearing was held is known as Section No. 3 of Route No. 33, mainly an extension of the East River tunnel from Whitehall Street, Manhattan, to Montague Street, Brooklyn, for operation by the New York Municipal Railway Corporation. This section will also include part of the connection between the Interborough Rapid Transit Company's East River tunnel, extending from Old Slip, Manhattan, to Clark Street, Brooklyn, and the existing subway at Fulton and Willoughby Streets, Brooklyn. Stations on the New York Municipal Railway Corporation will be at Montague Street and Court Street; and on the Interborough Rapid Transit Company line at Borough Hall. This contract will now be put into permanent form and will soon be advertised for bids.

The commission also opened bids for the construction of station finish on the six stations in Sections No. 1 and No. 2

of Route No. 11-B, the extension of the Fourth Avenue subway in Brooklyn from Forty-third to Eighty-sixth Street. The stations are located at Forty-fifth Street, Fifty-third Street, Bay Ridge Avenue, Seventy-seventh Street and Eighty-sixth Street. Under this contract the stations must be absolutely completed, the work including the electric wiring, all hardware, tile work, mosaic, hand rails, etc. The contractor will be required to finish the work within six months after the execution of the contract. According to the unofficial totals of the bids, the Station Construction Company, New York City, was the lowest bidder at about $250,000.

In compliance with the request of property owners along William Street, Manhattan, and with an opinion of the Appellate Division, the commission agreed to draw up the liability clause in this contract on this district in a different manner. Heretofore the contractor for any section of work assumed all liability resulting from such work. The work in William Street, however, will be through very low and partly made ground, and for that reason the property owners wish the city to be primarily responsible for any damages that may result to their buildings. The commission has acquiesced in this matter, but the contract will be drawn in such a manner that the contractor will still be responsible, although he will have the backing of the city.

Operating Results in Cleveland

According to the report rendered to the board of directors of the Cleveland (Ohio) Railway on July 25, the deficit for June is $59,366, based upon the ordinance allowances. The actual deficit was $170,037. On June 1 the interest fund was $395,942. With a reduction for the ordinance deficit, the fund is now $336,575. Should the deficit for July be as large as that of June, the interest fund will be reduced to a point below the minimum of $300,000. By some it is believed that this will be the result and that the 1-cent charge for transfers will be put into force again about Sept. 1. It is stated that there is little reason to believe that the figures for July will be any more favorable than those for June. The operating revenue for May was $665,513, while for June it was $642,637. The car mileage in June was greater than in May.

The seven men who formed the grievance committee of the local branch of the union recently returned to work. George R. Davies, president of the local branch, said that this did not mean that the effort to secure a modification of schedules and a minimum day of eight hours had been given up. The men might be called back to committee duty at any time and it was possible that the officers of the employees' association might come to the city to take part in the matter. The union has taken no action regarding the repeated proposal of J. J. Stanley, president of the railway, to grant an increase in wages of 1 cent an hour for all men in service one year or more and a minimum day of five hours, as noted in the ELECTRIC RAILWAY JOURNAL of July 25.

Revocation of Charters for Proposed Railways.—One hundred and seventy-five proposed street railways in Kansas were eliminated when the Secretary of State revoked their charters for failure to file annual statements and pay the corporation tax. None of the railways ever passed the blue-print stage.

New Automatic Block Signal System Opened.—On July 20 the Rochester & Sodus Bay Railway, Rochester, N. Y., placed in operation its new automatic block signal system for preventing head-on or rear-end collisions. The cost of this improvement was approximately $170,000. The contract for the installation of the system was let in August, 1913. The Wright-Wilson semaphore system is used.

Next Southwestern Electrical & Gas Convention.—At a recent meeting of the executive committee of the Southwestern Electrical & Gas Association, held in Dallas, Tex., July 18, it was unanimously decided that the next annual convention of the association would be held in Galveston, Tex., May 19, 20, 21, and 22, 1915. Further information can be obtained from H. S. Cooper, secretary, 405 Slaughter Building, Dallas, Tex.

Agricultural Expert Employed by Portland Company.—The Portland Railway, Light & Power Company, Portland, Ore., has created an agricultural department in charge of H. E. Cross, Gresham, Ore. Mr. Cross is an expert in farming and agricultural problems and his services will be at the disposal of farmers along the interurban lines of the company. It is the intention of the railway to furnish farmers with the proper information regarding the growing of feed for hog and cattle raising.

Doctrine of Regulated Monopoly Sustained in Idaho.—The Supreme Court of Idaho recently upheld the validity of the order of the Idaho Public Service Commission in which the commission adopted the doctrine of regulated monopoly in public utility service. The commission had refused to issue a certificate to the Idaho Power & Light Company to enter Twin Falls, holding that this community was already adequately served. The court decided the policy of the commission in preventing destructive competition of public utilities was legal.

Joplin Strike Shows No Change.—No changes have taken place in the strike situation on the lines of the Joplin & Pittsburg Railway, Pittsburg, Kan. Neither side has shown a disposition to make advances, though the tie-up had lasted since July 7. A three-year contract was recently signed with the overhead linemen of the company, who had been working on the "white way" at Pittsburg since the strike began. John Fennimore, superintendent and claim agent, signed the agreement for the company in the absence of W. A. Satterlee, general manager.

Legal Rate of Fare Law in Kentucky Voided.—The law enacted by the last Kentucky Legislature seeking to establish the legal passenger rate in Kentucky at 2½ cents has been held unconstitutional by Judge Gregory, of the Jefferson Circuit Court, on the ground that there is no enacting clause in the act, as required by the State Constitution. The Kentucky Traction & Terminal Company, Lexington, Ky., the only electric road in the State affected by the act, has announced that its old rate, which was less than 2½ cents a mile, would be re-established on its lines. This reduction was voluntary on the part of the company.

Women Conductors for Special Charity Work.—Women will be used as conductors on the lines of the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., for one day during the second week in October. They will be furnished by the Federation of Women's Clubs, and this organization will be given all money collected in excess of the average daily receipts. The project is in behalf of the children's charities of St. Joseph. Special attractions will be offered at Lake Contrary, a pleasure resort owned by the traction company. The members of the federation are urging a campaign to have owners of automobiles discard them for the occasion in favor of street cars in order to swell the receipts as much as possible.

Pulmotors Free for Public Use.—The Pittsburgh (Pa.) Railways, the Duquesne Light Company and the Equitable Gas Company have made arrangements to give the public the benefit of pulmotors belonging to them. Pulmotors have been placed in stations throughout Allegheny County, and physicians have been encouraged to become acquainted with their use and to call for them in cases of emergency. They are available upon call of any physician free of charge at any hour of the day or night, and when possible an expert employee will accompany the apparatus to supervise its use.

Hearing on Brooklyn Marginal Railroad.—The Board of Estimate and Apportionment of New York City set July 30 as the date for a hearing concerning the plan for the proposed South Brooklyn Marginal Railroad along the waterfront. It has been estimated that this road will cost the city at least $3,831,000. This sum covers construction work, a two-track elevated road from Poplar Street to Forty-second Street, with a surface classification yard at Erie Basin and a surface transfer terminal yard at the Eighth Ward Market. In case the line is authorized, the property required for the railroad and yards not already owned by the city will be purchased at private sale, or the city will institute condemnation proceedings for its acquisition.

Short Strike in St. John.—On July 22 the members of the street railway employees' union in St. John, N. B., went out on strike because of matters arising out of the dismissal of a conductor for a breach of rules. On the evening of July 23 two persons were seriously wounded as a result of rioting. Two of the company's cars were overturned and set on fire. The strike was ended by the signing of an agreement at 10 p. m. on July 24, under which the men returned to work the next morning. All the discharged employees were reinstated except Frederick Ramsey, the president of the union, over whose case the strike originated. Of the eleven other men dismissed, nine returned to work at once, and the cases of two more were take under advisement.

Commissioner Refuses Rehearing to Force Extension.—The Ohio Public Utilities Commission on July 22 refused to grant a new hearing of the case in which the Cincinnati (Ohio) Traction Company was relieved of extending its Warsaw Avenue line to Price Hill in accordance with an ordinance enacted by the City Council. City Solicitor Schoenle has expressed his determination of appealing the case to the Ohio Supreme Court. The complaint of the railway against the extension, sustained by the commission, was noted in the ELECTRIC RAILWAY JOURNAL of July 11. Mr. Schoenle has notified the company that it must reduce its fare to Kennedy Heights from 8 cents to 5 cents, in accordance with an ordinance requiring the reduction when this village came into the city, which recently occurred.

Examination as to Value of Franchise Extension.—Mayor Bennett of Rockford, Ill., has retained an expert of the Illinois Public Utilities Commission to examine the properties of the Rockford City Traction Company and to advise the City Council of the monetary value of the twenty-year franchise extension which the company has asked for. The authorization of the City Council in regard to securing the services of an expert was noted in the ELECTRIC RAILWAY JOURNAL of July 11. Secrecy has been maintained by the joint committee which has the franchise matter in charge, in regard to the name of the expert now chosen. It is reported that the series of demands to be made by the city before a franchise extension is granted include the payment of from 1 per cent of the gross earnings for the first five years up to 4 per cent for the fourth five years, the building of numerous extensions and the interchange of transfers between city and suburban cars. It is not expected, however, that the committee will make a definite report until the commission expert has completed his examination.

Compulsory Depreciation Accounting in Massachusetts.—The Massachusetts Public Service Commission on July 22 issued on its own initiative an order to railroads and street railways warning them to be prepared to show how they account for depreciation. In connection with this order the commission says: "It is manifest that no system of inquiry or of supervising the management of common carriers is sound and enduring which does not adequately take into account depreciation, not only the depreciation caused by ordinary wear and tear but also obsolescence caused by a great variety of things. Unless and until depreciation is taken care of—and shown in the accounts to be taken care of—there is no accurate way of determining whether dividends have been properly paid or whether a floating debt has been properly incurred for lawful purposes. Ultimately the method of dealing with depreciation adopted by the Interstate Commerce Commission is likely to be made applicable by this commission not only to railroads but to street railways as well."

Special Report Printed on Boston Transit Conditions.—The special report of the Massachusetts Public Service Commission and the Boston Transit Commission to the 1914 Legislature on transit conditions in metropolitan Boston has been printed as Senate Documents 448 and 474. In addition to the analysis of traffic conditions and fare problems outlined in the ELECTRIC RAILWAY JOURNAL of March 21, the publication includes twenty-two valuable appendices, with the most modern maps of the Boston transit system, graphic studies of traffic, earnings, seating facilities, etc.; comparisons of steam and electric railway fares within the Boston and suburban district, investment in transit facilities, an analysis of the profitable haul on the Boston Elevated Railway system, statements of rush-hour traffic at Boston Elevated Railway terminals, statements of fare reductions and increases and changes in transfer privileges on the Bay State Street Railway from 1900 to 1913, inclusive; the names of the constituent companies of the Bay State Street Railway, mileage and other data. An interesting account is also given of the inception and present use of the 8-cent inter-company checks now used at Boston.

Injunction against Sea Beach Line Embankment.—Judge Veeder in the United States District Court, Brooklyn, on July 23 issued a temporary injunction against the Brooklyn (N. Y.) Rapid Transit Company, restraining it from proceeding further with the construction of the new Sea Beach line embankment across the Gravesend meadows. Application for the injunction was made by J. Youngs, United States attorney for the district, who asserted that the "fill" being used in the construction was blocking up the navigable waters of Coney Island and Hubbards Creeks, and that unless steps were immediately taken to correct the damage done these two bodies of water would soon disappear. Assistant Engineer Harry T. Kerr, of the United States War Department, and Assistant United States District Attorney L. R. Bick on examination found that the dual subway system operations had caused a complete change in the line of the two creeks, because the soft marshland was unable to bear the weight of the material dumped upon it for the embankment and it had bulged forward into the creek beds. Whether or not the injunction will be made permanent is of grave concern because of its effect on the completion of the Sea Beach work within the contract time.

Improvements for Boston Subway.—The Boston Transit Commission has asked for bids covering the cost of improvements at the Park Street subway station in Boston, which will do away with objectionable curves in the tracks approaching and leaving the platforms immediately below the Common and enlarge the platform areas in connection with the approaching completion of the Boylston Street subway and the future extension of the Cambridge subway to the South Station and Dorchester. The Park Street station is one of the most densely patronized in the world. The platforms at present in use are narrow at their south ends, affording passage for barely more than a single person at their extremities. Under the proposed plan, however, the area of the east platform will be increased from 7200 sq. ft. to 9900 sq. ft., and that of the west platform from 8600 sq. ft. to 12,800 sq. ft. All main tracks will be straightened throughout practically their entire length, with the exception of the loop tracks at the north end. The south entrances to the station will also be slightly altered. Bids will close Aug. 4, the intention being to complete the alterations before the end of the year. Arrangements have been made for immediately utilizing the new incline for surface cars south of the Public Garden, and in about a month the Boston Elevated Railway will begin the installation of electrical equipment in the Boylston Street subway.

Washington Railways Almost Relieved of Paving Expenses.—Through an error of Congressional clerks, the street railways of Washington were recently almost freed from the requirement that they pay for the paving between their tracks. In the final draft of the appropriation bill for the expenses of the District of Columbia government for the next year, the following paragraph was discovered, after the measure had been sent to President Wilson for his signature: "Provided, that where the width of the street, avenue, or road to be paved or completely resurfaced from curb to curb or gutter to gutter, as the case may be, shall exceed 40 ft., the excess, including the cost of intersections or spaces within which street railways are required to pave, shall be paid for one-half out of the Treasury of the United States, and one-half out of the revenue of the District of Columbia." This proved to be an error of the conference clerks who collated the House and Senate amendments. The following has now been written into the bill: "Nothing contained in the District of Columbia appropriation act for the fiscal year 1915 shall be construed as relieving street railways from bearing all of the expenses of paving street or avenues between the exterior rails of the tracks of their road in the District of Columbia and for a distance of 2 ft. from and exterior to such tracks on each side thereof, as previously required."

Financial and Corporate

Stock and Money Markets

July 29, 1914.

There were heavy overnight declines through the entire list on the New York Stock Exchange to-day and all weakly margined stock went by the board. After the initial transactions were made, however, there were evidences of support at the new low level. The exchange for the first time was called upon to stand as a solitary free market in view of international complications on foreign exchanges. Rates in the money market to-day were: Call, 5 per cent; sixty days, 4 per cent; ninety days, 4 @ 4½ per cent; four months, 4½ per cent; five months, 4¾ per cent; six months, 5 per cent.

In the Philadelphia market to-day the general tendency was toward firmness. Philadelphia Rapid Transit closed at 13 @ 13¼ and Union Traction at 40¾ @ 41½.

The stocks on the Chicago market were weak, the prices being lower. Bonds were active at firm prices.

The Boston market showed low levels early to-day with gains toward a normal basis later, with a net gain of over a point in the general list.

The chief feature on the Baltimore Exchange to-day was trading in coal issues. The total sale of stocks was 1033 shares, of bonds $39,000, par value.

ANNUAL REPORTS

Brooklyn Rapid Transit Company

The comparative statement of income, profit and loss of the Brooklyn (N. Y.) Rapid Transit Company for the years ended June 30, 1913 and 1914, follows:

	1914	1913
Gross operating revenue:		
Transportation	$25,246,452	$23,865,260
Miscellaneous	311,797	287,028
Total	$25,558,249	$24,152,288
Operating expenses:		
Maintenance of way and structure	$2,021,647	$1,678,125
Maintenance of equipment	2,315,990	2,202,208
Operation of power plant	1,463,284	1,421,123
Operation of cars—trainmen's wages	4,520,023	4,062,796
Operation of cars—other expenses	1,696,132	1,572,661
Damages	543,885	605,092
Legal expense in connection with damages	219,759	217,211
General law expenses	65,098	61,934
Other general expenses	822,857	746,870
Freight and mail expenses	325,054	264,324
American Railway Traffic Company—expenses	823	1,112
Total	$13,994,552	$12,833,456
Net earnings from operation	$11,563,697	$11,318,832
Income from other sources	451,771	339,947
Total income	$12,015,468	$11,658,779
Less taxes and fixed charges	6,699,763	7,161,851

A comparison of the financial results of the Brooklyn Rapid Transit System for the two years shown by the above statement is affected by two special influences, one being the inclusion of the statistics of operation of the Coney Island & Brooklyn Railroad for the last six months of the fiscal year and the other being the conversion into stock of the greater portion of the Brooklyn Rapid Transit Company's first refunding gold mortgage bonds. As a result of these influences the passenger revenues showed an abnormal increase of $1,381.192, or 5.79 per cent. Miscellaneous revenues increased $24,769, or 8.63 per cent, giving a total increase in operating revenues of $1,405,961, or 5.82 per cent.

Higher wages and increased cost of materials are reflected in the operating expenses. Of the total increase for the year of $1,161,097, or 9.05 per cent, $343,523 (20.47 per cent) was for maintenance of way and structures, $113,783 (5.17 per cent) for maintenance of equipment, $457,227 (11.25 per cent) for operation of cars—trainmen's wages, $123,471 (7.85 per cent) for operation of cars—other expenses, $3,164 (5.11 per cent) for general law expenses, $75,986 (10.17 per cent) for other general expenses and $60,730 (22.98 per cent) for freight and mail expenses. Damages showed a decrease of $61,206 or 10.12 per cent in spite of the heavier traffic. The expenses generally showed relatively less increases than the increase in business, except appropriations in connection with employee's welfare work. The net earnings from operation increased $244,865, or 2.1 per cent, while net income showed an increase of $818,777, or 18 per cent. The fixed charges, even after making provision for the interest on the cost of the Coney Island & Brooklyn Railroad shares, reflected a substantial decrease of 6.4 per cent.

An amount of $4,177,000 par value of the refunding mortgage 4 per cent bonds had been converted into stock prior to June 30, 1913. The conversion privilege expired on July 1, 1914, and the total number of bonds converted was $29,619,-

000, leaving outstanding in the hands of the public $3,459,000, and owned by the companies of the system, $18,714,000. The increase of stock by reason of the conversion of bonds was $29,619,000, making the total capital stock on July 1, 1914, $74,520,000. The operating results for the year show a surplus of $5,315,704.86 after paying $553,826.68 of interest on the refunding bonds which have now been converted into stock. With this interest saved the surplus earnings would have been equivalent to 7.87 per cent on the stock if the issued stock on July 1, 1914, after conversion, namely, $74,520,000, had been outstanding during the year.

On June 9, 1913, the number of stockholders was 3,709. On the same date of 1914 there were 6,319, an increase of 2,610, or over 70 per cent. The report states that this increase is accounted for partly on account of the conversion of bonds into stock and partly on account of wider distribution of the company's shares.

According to the report, the burden of taxation continues to increase, crippling the company's ability to furnish the best facilities and service. For the fiscal year the taxes paid by the system were at the rate of over $4,800 per day. Inasmuch as the net return per passenger was less than one cent, it required the transportation of over 540,000 passengers each day to yield profit enough to pay the tax bills. Capitalized at 5 per cent, the annual tax bills would permit an expenditure of over $35,000,000 for added improvements, facilities and extensions.

The year's schedule of track and paving renewals was the largest in the transportation history of Brooklyn, covering more than forty-four miles. The expenditures for maintenance of equipment are also the largest on record. The construction charges (outside of those made for rapid transit additions and extensions under contracts with the city) aggregated $1,543,316. During the year the company lost $248,000 in expenses on account of interruptions of service caused by the operations of contractors for the city in constructing sewers, to say nothing of the loss in earnings. The freight business during the year yielded a gross revenue of $497,569, an increase over the preceding year of $126,716.

The New York Municipal Railway Corporation, which was formed in the interests of the Brooklyn Rapid Transit Company in connection with the latter's dual rapid transit allotments, prosecuted as vigorously as conditions would permit the work of construction and equipment of rapid transit lines required under its contracts with the city dated March 19, 1913. Expenditures for construction and equipment to June 30, 1914, under the city contracts were as follows:

On account of contribution to city-owned lines	$8,230,256
On account of equipment of city-owned lines	1,647,982
On account of additions, extensions, improvements of existing railroads	4,798,868
Undistributed	593,487
Total	$15,270,593

The report states that the operation of the Centre Street Loop has during its eleven months of operation failed to provide the company's preferentials by $219,687, and has also failed to provide the city's charges on the cost of construction of property placed in operation during this period by $310,060, leaving a total deficit in both the company's preferentials and the city's charges of $529,747. The report states that only by merging the operation of this line and the Fourth Avenue subway with the entire new system will the city eventually be able to make them self-supporting.

The system of compulsory medical inspection and free medical attendance for employees excused on account of illness, affecting nearly 10,000 men in the operating department, completed its first year Dec. 31, 1913. A comparison of records of time lost on account of illness for the entire year as to the surface lines, and for the year, exclusive of Sundays and holidays, as to the elevated lines, indicated a reduction of time lost of approximately 24 per cent.

The report states that it is too soon to estimate the full effect of the order of the Public Service Commission under which a new transfer system went into effect on June 1, 1914, increasing the total number of transfer points from 721 to 1008. The passenger earnings of the companies affected, however, fell off during the month $67,827. In regard to fire insurance, it is noted that the companies with a view to finally insuring their own fire risks, have gradually been accumulating an insurance reserve fund, which on June 30, 1914, aggregated $599,197.

Brazilian Traction, Light & Power Company, Ltd.

The first annual report of the Brazilian Traction, Light & Power Company, Toronto, Ont., covering the period from the incorporation in July, 1912, to Dec. 31, 1913, gives the following income statement for the period:

Revenue from securities owned and under contracts with subsidiary companies		$11,266,698
Interest on advances to subsidiary companies		256,698
Total		$11,522,836
Head office, general and legal expenses, interest, discount and exchange		324,343
Surplus available for dividends		$11,198,493
Dividends No. 1, 2 and 3, on 6 per cent preferred shares at 1½ per cent each		$450,000
Dividends No. 1, 2, 3, 4 and 5, on common shares at 1½ per cent each		7,735,495
		$8,185,496
Surplus carried to profit and loss		$3,012,997

The report states that the consolidation of the interests of the Rio de Janeiro Tramway, Light & Power Company, Ltd., the Sao Paulo Tramway Light & Power Company, Ltd., and the Sao Paulo Electric Company, Ltd., undertaken in July, 1912, has been successfully carried out and on Dec. 31, 1913, practically the entire capital stock of these three companies had been acquired by the Brazilian Traction, Light & Power Company, Ltd.

At the conclusion of 1913 the Brazilian Traction, Light & Power Company, after payment of the regular 6 per cent dividend on its ordinary shares, had a credit balance to profit and loss of $3,012,998, apart from the credit balances of the general reserve funds and profit and loss accounts of the subsidiary companies. This credit balance for the Rio de Janeiro Tramway, Light & Power Company, Ltd., amounted to $6,807,374; for the Sao Paulo Tramway, Light & Power Company, Ltd., $5,151,660, and for the Sao Paulo Electric Company, Ltd., $56,112. The combined reserves and surpluses of the Brazilian Traction, Light & Power Company and its subsidiaries at the present time, therefore, total $15,028,144.

The combined net earnings from the operation of the subsidiaries for 1913 showed an increase of $1,709,437 over the corresponding period for 1912. The operation of the Rio de Janeiro division resulted in an increases of gross income of $1,690,766. There was an increase of 12,000,000 passengers for 1912, and the company now has under order and construction one hundred new cars to provide for additional traffic. The gross earnings of the Sao Paulo division increased $842,000 during 1913. A total of 104 electric passenger cars was added to the equipment and the tramway lines were extended 15.4 miles. The total passengers carried increased from 48,113,109 in 1912 to 56,776,702 in 1913.

Great Berlin Street Railway

The Grosse Berliner Strassenbahn (Great Berlin Street Railway) report for the calendar year 1913 shows the following comparison with the year 1912, the figures for which are given in parentheses: The number of passengers carried was 466,300,000 (463,300,000) and the gross earnings from passenger business were $11,104,540 ($11,036,730). The mileage was 65,995,687 car miles (64,826,991 car miles), and the earnings per passenger car mile 16.69 cents (16.88 cents). The total gross earnings were $11,443,829 ($11,395,993) and the operating expenses $6,711,134 ($6,457,052). The ratio of operating expenses to gross earnings was 58.64 per cent (56.66 per cent). Salaries and wages totaled $4,057,758 ($3,925,534), and expenses for employees' welfare $260,990 ($235,756).

The company operated 1757 motor cars and 1091 trail cars. As 1396 cars were passed through the shops during the year, it appears that cars are completely overhauled about once every two years. The maintenance of rolling stock cost $896,990 ($878,253); of buildings, $67,630 ($60,605), and of way and line for 592.4 km (367.3 miles), $430,944, as compared with $333,594 in 1912 for 570.5 km (353.7 miles) of track. Accidents, including contingent expenses, cost $215,999 ($218,389). To the renewal funds a total of $625,000 was assigned, of which $137,500 was applied to the car renewal fund. The sum of $816,668 was paid for franchises, taxes, etc. The share of the Berlin Municipality

alone was $158,310. A dividend of 8 per cent was declared on a capital stock of $25,020,600.

The company employed 12,540 people, of whom 9268 were members of the pension society. During the year the pension fund received $135,215 from the members, $159,860 from the company and $116,833 from investments. The sick benefit society comprised practically all of the employees. The average number of persons carried a day was 1,277,534, equivalent to 3449 passengers per mile of track. During the year sixteen persons were killed, 132 badly injured and 919 slightly injured. The company was blameless in the case of five deaths, twenty-four severe injuries and 351 slight injuries.

New York Railways Income Bond Suit

On July 27 the New York Life Insurance Company brought suit against the New York (N. Y.) Railways, charging improper retention of interest on the company's 5 per cent non-cumulative income bonds for the benefit of its stockholders. Beside the New York Railways the following are named in the suit: Farmers Loan & Trust Company; Edward S. Markston, president Farmers Loan & Trust Company; Alexander J. Hemphill, president Guaranty & Trust Company; Guy C. Tripp, chairman board of directors Westinghouse Electric & Manufacturing Company, and Harry Browner, director Equitable Trust Company. The New York Life Insurance Company, together with the co-operating bondholders, represents about $6,500,000 of the $30,626,977 affected by the alleged transaction.

The chief point at issue between the two companies is the treatment of the unexpended reserves for injuries and damages, as noted in the ELECTRIC RAILWAY JOURNAL of May 7. The insurance company does not object to reserves being set up by the railway, but it alleges that 8 per cent was set aside, while in 1911 only 6.45 per cent and in 1912 only 5.95 per cent of the passenger revenue was expended. The insurance company contends that the unexpended amounts should automatically revert to surplus. It demands that the approval of the directors of the statements of semi-annual earnings be set aside and it asks for an accounting of all railway earnings and income during 1912 and 1913. Furthermore, it requests that any money found to be applicable to the payment of interest be placed in the hands of a receiver for disposal by court direction.

Since Jan. 1, 1912, the New York Railways has set up a reserve of 8 per cent of the passenger revenue for injuries and damages, the calendar year 1913 being included. In February, 1914, however, the company after an investigation by outside engineers changed the reserve for 1913 to 7½ per cent at the instigation of the insurance companies, but this move was criticised by the Public Service Commission on account of its retroactive features.

Batavia (N. Y.) Traction Company.—The Batavia Traction Company, which was incorporated in New York March 19 to purchase the Buffalo & Williamsville Railway, as noted in the ELECTRIC RAILWAY JOURNAL of May 9 and June 18, has issued $25,000 in stock in $1 shares and $25,000 (total issue) of first mortgage 5 per cent gold bonds, dated July 1, 1914, and due in 1944, but callable on sixty days' notice at par. Of the bond issue $16,000 has already been subscribed for in Batavia.

Binghamton (N. Y.) Railway.—The Binghamton Railway has announced that no dividend can be declared for two years. The last dividend paid was 2 per cent in February, 1914.

Boston (Mass.) Elevated Railway.—At a meeting of the directors of the Boston Elevated Railway on July 27, the board authorized the payment of a quarterly dividend of $1.50 per share on Aug. 15. This action restores the company to the 6 per cent class, in which it stood from 1902 to 1913, when the stock was put on a 4 per cent basis as a result of losses incurred during the strike of 1912. A 2 per cent dividend was declared in February, 1914. It is stated that the company's earnings increased about $900,000 in the year ended June 30, 1914.

Cape Town (S. A.) Consolidated Tramways & Land Company, Ltd.—According to the report of the Cape Town Consolidated Tramways & Land Company, Ltd., for the year ended Dec. 31, 1913, after payment of administration expenses and interest charges, a balance of £1,797 was shown to the debit of profit and loss. This, added to the balance brought forward from 1912, makes a total debit to profit and loss of £8,103. No dividends were declared by the subsidiary companies during the year. The operation of the Camps Bay Tramways resulted in a profit of £1,599, as compared to a profit of £2,973 the previous year.

Hocking-Sunday Creek Traction Company, Nelsonville, Ohio.—According to a petition presented to the Ohio Public Utilities Commission, unless the commission authorizes the Hocking-Sunday Creek Traction Company to issue $300,000 of twenty-year 6 per cent bonds for the completion of its road and the refunding of present obligations, a receiver must be appointed for the property. This road extends from Nelsonville to Athens, a distance of 14 miles. It is half completed and the finished part has been in operation for almost two years. The remainder of the road is graded and bridges have been constructed.

Jersey Central Traction Company, Keyport, N. J.—The Jersey Central Traction Company has executed a general refunding improvement and extension mortgage for $5,000,000 to the Girard Trust Company, Philadelphia, as trustee. This mortgage secures bonds dated March, 1914, and due 1939, but subject to call March 1, 1917, or on any interest date at 102½. Of the bonds, $1,500,000 is reserved to retire the outstanding $230,000 of first 5's and $1,270,000 of general mortgage bonds. The mortgage provides that the discount on the sale of the bonds be amortized during their life. The authorization of this mortgage was noted in the ELECTRIC RAILWAY JOURNAL of May 23.

Kankakee & Urbana Traction Company, Urbana, Ill.—The Illinois Public Utilities Commission has authorized the Kankakee & Urbana Traction Company to sell $213,000 of preferred capital stock for the purpose of extending its line from Rantoul to Paxton. The company has been operating 15 miles of track from Urbana to Rantoul and has now under construction 5 miles between Rantoul and Ludlow.

Lincoln Railway & Light Company, Lincoln, Ill.—James E. Hoblit, cashier of the Lincoln State Bank, has been appointed receiver of the Lincoln Railway & Light Company. He assumed charge of the line on July 18. The receivership is the result of two suits brought against the company, the first by F. G. Hudson, Charlestown, Ill., and F. M. Maury, Philadelphia, Pa., and the second by T. F. Kuhl, trustee for the company. The suits charged that the company had failed in the payment of interest and principal of its outstanding bonds.

Los Angeles & San Diego Beach Railway, San Diego, Cal.—The Los Angeles & San Diego Beach Railway has filed an application with the California Railroad Commission asking for authority to issue $825,000 of bonds, secured by a trust deed of all the company's property. The funds are to be used in electrifying certain portions of the company's lines, as previously ordered by the commission in approving those now in existence. The company also proposes to acquire new terminal grounds in San Diego and to erect a terminal building at a cost of $25,000. The company also wishes to purchase sixteen passenger cars and seventeen passenger trailers at a cost of $125,000. The total sum which the company plans to expend is $723,198, divided as follows: plant investment, $371,612; new equipment, $131,000; refunding indebtedness, $180,586, and interest for first year, $40,000.

Massachusetts Northeastern Street Railway, Haverhill, Mass.—The Massachusetts Northeastern Street Railway has petitioned the Public Service Commission of Massachusetts for the approval of an issue of mortgage bonds not exceeding a par value of $1,000,000. These are part of a proposed twenty-year 5 per cent issue of an aggregate face value not to exceed $2,000,000 at any one time outstanding, dated May 1, 1914. The commission on Sept. 13, 1913, approved an issue of mortgage bonds by the company in the amount of $1,000,000, but since that time the stockholders have voted to authorize the bonds to be dated July 1, 1914, instead of Jan. 1, 1914.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—An application was filed with the California Railroad Commission on July 21 by the Oakland, Antioch & Eastern Railway asking authority to issue $900,000 of 6 per cent convertible gold notes to be secured by first mortgage thirty-year gold bonds in the ratio of two to one. The notes are to be convertible before maturity at the holder's option on the basis of 80 per cent of the par value of the bonds and accrued interest for par value of the notes and accrued interest. The notes are also to be redeemable in whole or in part at the option of the company on any interest date at face value and accrued interest on not less than thirty days' notice. The proceeds of the issue are to be used to pay off the floating indebtedness, which on April 30 amounted to $1,349,960, with cash on hand of $44,562 and accounts receivable of $89,144.

Ottawa (Ont.) Electric Railway.—The gross earnings of the Ottawa Electric Railway for the year ended Dec. 31, 1913, were $1,041,282. Operating expenses and maintenance were $629,122, giving net earnings of $412,160, as compared to $400,059 in 1912. The net earnings were disposed of as follows: Four quarterly dividends at 3 per cent and a bonus of 3 per cent, $281,535; interest on bonds and loans, $20,772; mileage payments, $13,737; taxes, $12,-222; credit of contingent account, $55,000, and credit of profit and loss, $28,894. During the year 23,987,883 passengers were carried, as compared to 21,815,798 in 1912, an increase of 2,172,085. The record of the company shows an increase in gross receipts from $71,000 in 1892 to $1,041,282 in 1913.

Philadelphia Company, Pittsburgh, Pa.—The Philadelphia Company, which controls the street railway lines in Pittsburgh and vicinity, recently filed notice of a reduction in capital stock from $73,000,000 to $69,433,400.

Piedmont & Northern Railway, Charlotte, N. C.—The merger of the Piedmont Traction Company, operating 23 miles of electric railway between Charlotte and Gastonia, N. C., and the Greenville, Spartanburg & Anderson Electric Railway, operating 102 miles of electric line between Spartanburg, Greenville, Anderson and Greenwood, S. C., into the Piedmont & Northern Railway, was noted in the ELECTRIC RAILWAY JOURNAL of July 25. It is deemed improbable that any of the securities of the new company will be on the market soon. Both of the merged lines were built by J. D. Duke and associates and to a large extent have been privately financed. The $50,000,000 mortgage which has been executed by the new company is to cover bonds for the purchase of the merged lines, their equipment, real estate and other property and for the construction of additions, extensions, branches and improvements of existing lines. It will require the construction of 50 miles of railroad to connect the north and south divisions. The equipment is all high speed and the company is inaugurating a freight service in conjunction with the steam railroads with which it connects.

Porto Rico Railways, Ltd., Toronto, Ont.—According to the seventh annual report of the Porto Rico Railways, Ltd., which controls the Porto Rico Railway Light & Power Company, San Juan, Porto Rico, the gross earnings for the year ended Dec. 31, 1913, amounted to $850,122, as compared to $828,084 for the previous year, an increase of $22,037. The net income of $447,375 compared with $373,405 was an increase of $73,970. After providing for interest charges and preferred dividends the surplus was $222,156, equal to 7.4 per cent on the common stock. The number of passengers carried during the year was 7,283,479, or an increase of 572,176. The freight hauled amounted to 165,958 tons, an increase of 18,030 tons. There was expended on capital account during the year $483,326. Maintenance expenses amounted to $104,677.

San Joaquin Light & Power Corporation, Bakersfield, Cal.—The California Railroad Commission has authorized the San Joaquin Light & Power Corporation to issue promissory notes in the amount of $249,967 to renew other notes outstanding. Steps are now being taken by this corporation to pay off its floating indebtedness of $1,615,-661 and to provide funds for new construction. The commission has also made an order granting the company additional time in which to issue $1,776,000 of bonds which it proposes to pledge as security for certain two-year 6 per cent collateral trust notes. The authority as now granted will expire Dec. 31, 1914.

Titusville (Pa.) Electric Traction Company.—The receiver of the Titusville Electric Traction Company has been authorized by the court to sell the property at public auction subject to outstanding mortgages and liens. The capitalization of this company, which was chartered in 1897, is reported to be $300,000 of stock and $300,000 of first mortgage 6 per cent gold bonds. The company has 16¾ miles of track connecting Titusville, Pleasantville, and Fieldmore Springs. The results of operation for the year ended June 30, 1913, were as follows: Gross earnings, $37,108; net income, $6,527, and deficit, after interest payment of $6,370 and taxes, $611.

Underground Electric Railways, Ltd., London, England.—The London Stock Exchange recently listed the following additional securities of the London & Suburban Traction Company, Ltd.: 9649 ordinary £1 shares, 16,426 5 per cent cumulative preferred £1 shares, and £4,224 of 4½ per cent first mortgage debenture stock, making the total amounts listed on the exchange £1,842,785, £1,597,485 and £180,976 respectively.

Winnipeg Electric Company, Manitoba, Can.—G. M. Manton, Winnipeg, Man., was on July 24 elected vice-president of the Winnipeg Electric Railway, to succeed the late Sir William Whyte. G. V. Hastings was elected director of the company.

Dividends Declared

Connecticut Railway & Lighting Company, New Haven, Conn., quarterly, 1 per cent, preferred and common.

Grand Rapids (Mich.) Railway, quarterly, 1¼ per cent, preferred.

Illinois Traction Company, Peoria, Ill., quarterly, three-quarters of 1 per cent, common.

Monongahela Valley Traction Company, Fairmont, W. Va., 2½ per cent, preferred.

Toledo, Bowling Green & Southern Traction Company, Findlay, Ohio, quarterly 1¼ per cent, preferred.

Union Street Railway, New Bedford, Mass., quarterly, 2 per cent.

Traffic and Transportation

Accidents on Interstate Railways

The Interstate Commerce Commission, Washington, D. C., has issued a summary for the three months ended Dec. 31, 1913, of the casualties to persons on railways under its jurisdiction.

The total number of casualties of all classes reported to the commission amounted to 2792 for persons killed and 50,776 for persons injured. This statement includes 85 passengers killed and 4136 passengers injured and 826 employees killed and 14,576 employees injured. The casualties were sustained by employees while at work, by passengers getting on or off cars, by persons at highway crossings, by persons doing business at stations, etc., as well as by trespassers and others. In addition 117 persons were killed and 29,007 persons injured in "industrial accidents," which term covers accidents not involved in train operation but occurring to railway employees, other than trainmen, on railway premises. The report for interstate electric railways in particular shows that the list of those killed during the three months was 124, or 4.44 per cent of the total, and the list of injured 1445, or 2.84 per cent.

From the statement of the commission for electric railways, which is appended, the columns have been eliminated which show casualties to employees not on duty and to trespassers. Two of the former class were killed and six injured, while of trespassers thirty-nine were killed and thirty-seven injured. The summary as given by the commission, with the eliminations noted above, is reproduced as follows:

Causes	Number of Accidents	Passengers Killed	Passengers Injured	Employees on Duty Killed	Employees on Duty Injured	Other Persons Not Trespassing Killed	Other Persons Not Trespassing Injured	Total Persons Killed	Total Persons Injured
Collisions	57	2	170	3	30	...	...	5	203
Derailments	15	1	27	1	4	...	...	2	31
Accidents to trains, cars, or engines, except collisions derailments and boiler explosions	1	...	...	..	...	...	...	...	....
Bursting of, or defects in, locomotive boilers, or boiler attachments	...	...	...	..	...	...	...	...	....

1912	79	37,513	7	415
1911	65	33,395	10	376
1910	67	49,677	41	455

Puget Sound Electric Railway Fare Case Reviewed

The history of the Puget Sound Electric Railway fare case concerning rates between Seattle and Tacoma, to which reference has been made previously in the ELECTRIC RAILWAY JOURNAL, is reviewed as follows in an editorial "Liberty" in the July *Public Service Journal* published by Stone & Webster, managers of the railway:

"The Public Service Commission of the State of Washington not long ago abolished an order of the old Railroad Commission which was put in force in 1910, the only effect of which was a waste of energy and accomplishment. In 1910 the Railroad Commission of Washington ordered a reduction in the passenger rates of the Puget Sound Electric Railway, which had been previously fixed by the company at 2 cents a mile, with commutation rates to regular riders of 1.4 cents a mile. At the same time it announced that the corporation was entitled to earnings of 7 per cent on the investment, after operating expenses, taxes and depreciation had been provided for. The commission estimated that under the tariff ordered this result would be accomplished. For seven years up to and including 1908, the fares of this road had been fixed at considerably less than 2 cents a mile, which was too low for the service furnished, but it was hoped that the general and traffic conditions would enable it to maintain these rates. On account, however, of financial losses it was found necessary to advance the rates to approximately 2 cents, with a commutation rate, as we have stated, of 1.4 cents. Compared with steam railroad rates and with interurban rates in Washington and throughout the country, it was felt by the Puget Sound Railway that its rates were not at all excessive. Complaint, however, was made to the Railroad Commission of the State of Washington, which placed a cash value on the company's property of $4,070,237 and forced the company to lower its rates to figures which it believed would admit of a return of 7 per cent on this amount.

"The matter was carried to the courts, but eventually, on Oct. 14, 1911, the order was put in force in order that the rates of the commission might be tested to ascertain if the commission's estimate was correct. After this tariff had been in force for approximately two years, it was found that the rates, instead of yielding a net return of $289,179 (7 per cent on the commission's valuation) for the year 1912, yielded only $89,655, with no provision made for accrued depreciation. In other words, instead of yielding 7 per cent the rates had yielded only 2.2 per cent. The showing for the year 1913 was even worse, the net return being only $67,718, or 1.66 per cent, instead of 7 per cent as estimated by the commission on the actual money invested by the company.

"Since this order was forced upon the company, the

Railroad Commission has been superseded by the Public Service Commission in the State of Washington. In view of the facts just stated, it will easily be seen that it was necessary for the Puget Sound Company to seek relief in order that the property might be maintained and that a fair return might be given the owners on their investment. Consequently an application was made to the Public Service Commission, asking that the order of the Railroad Commission be set aside and the company be allowed to operate under a new tariff. The hearing on this application began on April 15, and on May 13 the Public Service Commission abolished the order of the old Railroad Commission which was put in force in 1910."

Near-Side Stop in Operation in Indianapolis.—The Indianapolis (Ind.) Street Railway has begun to stop its cars on the near side of the street, in compliance with a new traffic ordinance recently drafted by the City Council.

Near-Side Stop for Pine Bluff.—An ordinance was recently passed by the Council at Pine Bluff, Ark., requiring the cars of the Pine Bluff Company to stop on the near side of the street and to discharge passengers from the front end of the car.

Pole Signs for Information of Patrons.—The Galesburg & Kewanee Electric Railway, Kewanee, Ill., has installed signs on all poles along its route where cars are supposed to stop, to inform its patrons as to just what time the cars are due to pass.

Increase in Fare Authorized in West Virginia.—The Public Service Commission of West Virginia on July 23 sustained the appeal of the Parkersburg-Marietta Interurban Railway, Parkersburg, W. Va., to increase its rates between Parkersburg and Marietta by way of Williamston from 10 cents to 20 cents by creating four traffic zones. The company is required, however, to issue commutation tickets that will be equivalent to a 5-cent fare for 6½ miles from Parkersburg.

Montpelier Fare Increase Case Postponed.—The Barre & Montpelier Traction & Power Company, Montpelier, Vt., and the city of Montpelier have reached an agreement to the effect that there will be no increase in fares pending continuation of hearings on Aug. 21 in the equity suit brought by the city to determine the legal right of the company under its franchise to charge a greater fare than 5 cents. The counsel of the railway asked for a continuation in order to have more time for the preparation of the company's case.

Pay-As-You-Enter Plan for Covington.—An ordinance providing for the installation of pay-as-you-enter devices and collapsible seats for conductors on all cars of the South Covington & Cincinnati Street Railway, Covington, Ky., was recently introduced by Mayor Phillips at a meeting of the city commissioners. The ordinance provides that these devices must be installed upon one-third of the cars within three months and upon all of the equipment within nine months. The matter has been referred to the committee of the whole.

Reduction of Fares for Holden.—The Massachusetts Public Service Commission has ordered the Worcester (Mass.) Consolidated Street Railway to reduce its fares between Holden and Worcester from 15 cents to 10 cents. The decree orders that the railway shall furnish special tickets at the rate of 10 cents each, good between 5.40 a. m. and 7.40 a. m. and between 4.55 p. m. and 6.55 p. m. for the use of its regular patrons traveling between any part of Holden and Worcester city hall. The distance between Holden and Worcester is 9 miles.

Springfield Traction Company Increases Wages.—The Springfield (Mo.) Traction Company on July 21 announced a voluntary increase in wages amounting to 1½ cents an hour for both conductors and motormen. About 100 employees will be benefited by the increase, which will add $5,000 annually to the payroll. Motormen and conductors who have been employed less than one year will receive the minimum scale of 17½ cents; more than one year and less than two years, 19 cents; more than two years and less than three years, 20 cents, and three years, 21 cents. Those who have been with the company five years or longer will get the maximum, 22½ cents an hour. About 50 per cent of the men affected by the increase are in this group.

Armed Guards Proposed for Suburban Cars.—As a result of a recent car hold-up in Los Angeles in which a conductor was fatally injured, a meeting of all the peace officers of the city and county and the heads of both the Los Angeles Railway and the Pacific Electric Railway has been called to devise ways of protection for car crews. It is expected that special armed deputies will be placed on all cars going to the outskirts of the city and that men will be posted at all line terminals.

"Safety First" Campaign in Louisville.—The cars of the Louisville (Ky.) Railway on both city and interurban lines are carrying large black and white placards announcing that "safety first" is the slogan of the league of employees of the company, the formation of which was noted in the ELECTRIC RAILWAY JOURNAL of June 27. In most cases the cards are hung at the front end of the cars, over the upper part of the front windows. The Louisville papers have called attention to the appearance of the placards and have commented favorably upon the objects of the movement.

Fatal Trolley Crash at Westport.—Three persons were killed outright, another died later and forty were injured as the result of a head-on collision at Westport, Conn., on July 22 between a three-car electric train carrying Sunday school picnickers and a trolley express car on the Norwalk division of the Connecticut Company. It is alleged that the motorman in charge of the train was running at high speed in order to reach a siding ahead of the express car, which was approaching on the same stretch of single track. C. H. Chapman, superintendent of the Bridgeport division, states that it is apparent one of the motormen ran by his signal, and the investigation will disclose the one at fault.

Guard on Rear Platform of Elevated Trains.—As a result of complaints made to the Public Service Commission for the First District of New York in regard to rowdyism on the back platforms of the rear cars of elevated trains in Brooklyn, the commission has served an order on the New York Consolidated Railroad, the Nassau Electric Railroad and the South Brooklyn Railway, the operators of the elevated lines, directing them to provide and maintain an employee during the morning and evening rush hours on the rear platform of all such trains. This employee shall control the conduct of passengers, to the end that the safety and convenience of other passengers shall be guarded from boisterous or improper conduct. The order is to go into effect immediately.

Springfield Company Petitions for New Rate Hearing.—The Springfield Gas & Electric Company, Springfield, Mo., on July 25 filed a motion for a new hearing of its rate case by the State Public Utilities Commission. The order of the commission reducing the company's rates 7 per cent, and fixing 7 per cent as a fair return on the investment, as noted in the ELECTRIC RAILWAY JOURNAL of July 11, is characterized by the company in its motion as unfair, unjust and unreasonable. The petition alleges that the commission is an administrative body solely, and when passing on questions of a judicial nature is violating the Constitutions of Missouri and of the United States. The brief that was presented by the company in the original hearing was abstracted in the ELECTRIC RAILWAY JOURNAL of May 20.

Massachusetts Commission Orders Reduction in Height of Steps.—Upon the petition of the Worcester board of aldermen, the Hyde Park Current Events Club and other organizations, the Massachusetts Public Service Commission has issued an order providing that all electric cars hereafter purchased and operated in the State must be equipped with steps not exceeding 15 in. in height, the first step being measured from the top of the rail. The order also requires that all cars now operated by electric railways in the State shall be so altered so that by July 1, 1915, no bottom step shall be more than 17 in. above the rail. The commission reserves the right, however, to extend this time limit for financial or other satisfactory cause. Another section of the order stipulates that electric railways, before purchasing new cars or making changes in present equipment, shall submit to the board for its approval drawings in sufficient detail to show the type of cars to be purchased or the changes contemplated.

Personal Mention

Mr. Sidney Ossoski has severed his connection as general claim agent of the Chicago (Ill.) Railways.

Mr. R. S. Rowley has been appointed general claim agent of the Chicago (Ill.) Railways in place of Mr. Sidney Ossoski.

Mr. A. E. Dedrick has been appointed secretary and auditor of the Newcastle & Lowell Railway, New Castle, Pa., to succeed Mr. E. D. Gaul.

Mr. William Dods has been appointed vice-president of the Carbon Transit Company, Mauch Chunk, Pa., to succeed Mr. C. H. Latta.

Mr. E. T. Chapman has been appointed assistant treasurer of the Connecticut Company, New Haven, Conn., to succeed Mr. T. F. Paradise.

Mr. Peter M. Miller has been appointed assistant treasurer of the Jacksonville (Fla.) Traction Company, to succeed Mr. Arthur F. Butler.

Mr. H. E. Harley has been appointed chief engineer of the power station of the Jacksonville (Fla.) Traction Company, to succeed Mr. F. D. Barry.

Mr. Charles N. Hebner has resigned his position as secretary of the Illinois Public Utilities Commission, the resignation taking effect on July 24.

Mr. R. A. Anderson has been appointed chief engineer of the power station of the Portsmouth (N. H.) Electric Railway, to succeed Mr. John Kirk.

Mr. J. D. Kline has been appointed superintendent and purchasing agent of the Montgomery (Pa.) Transit Company, to succeed Mr. E. W. Goss.

Mr. A. M. Nanton, Winnipeg, Man., Can., was on July 24 elected vice-president of the Winnipeg Electric Railway, to succeed the late Sir William Whyte.

Dr. Robert Pattai has been elected president of the Austrian Association of Local & Light Railways. This association now numbers fifty-four electric and forty-three steam railways with a total length of 1503 miles.

Mr. William B. McKinley, president of the Illinois Traction System, addressed the Jefferson City (Mo.) Commercial Club on July 23. Mr. McKinley asserted that Missouri's drastic corporation laws have retarded the development of the State more than any other factor. He referred particularly to the measure providing that a foreign corporation cannot hold more than 10 per cent of the stock of a domestic company.

Mr. T. R. Veach has been appointed auditor of the San Francisco, Napa & Calistoga Railway, Napa, Cal., to succeed Mr. George Maxwell. Mr. Veach was formerly employed with the Central California Traction Company, San Francisco, Cal., and the Reno (Nev.) Traction Company for about two years as assistant auditor. Prior to this time he was with the Great Western Power Company as bookkeeper, cashier and traveling auditor for a period of about five years.

Mr. T. H. Blaikie has been appointed auditor of the Albany (N. Y.) Southern Railroad, to succeed Mr. A. L. Linn, resigned. From April, 1904, to December 31, 1911, Mr. Blaikie was head bookkeeper and chief clerk of the Consolidated Railway Company and the Connecticut Company at New Haven, Conn. When the United Electric Light & Water Company began operations Jan. 1, 1912, at Waterbury, Conn., he was offered the position of chief accountant, which he filled until May 15, 1914.

Mr. J. B. Rannie, who has been connected with the British Columbia Electric Railway, Ltd., Vancouver, B. C., for nearly twenty-five years, has severed his connection with the company. Mr. Rannie's career with the company dates from September, 1889. After serving as conductor and motorman for a number of years in Vancouver city service, he was appointed traffic superintendent of the Vancouver lines in 1900. In 1911 he was appointed traffic agent, a position which he occupied up to the date of his resignation. Mr. Rannie has purchased a small ranch near Chilliwack, B. C., where he will engage in agricultural pursuits.

Mr. J. T. Huey has been appointed superintendent of the railway department of the Birmingham Railway, Light & Power Company, Birmingham, Ala., to succeed Mr. Geo. H. Harris, resigned. Mr. Huey's entire railway experience has been confined to the Birmingham Railway, Light & Power Company and its predecessors. He has been in the service of these companies for the last twenty years, during which time he worked in practically all departments. Prior to his promotion to the position of superintendent of the railway department, he was assistant superintendent of this department under Mr. Harris.

Mr. C. F. Hewitt has been appointed assistant general manager of the United Traction Company, Albany, N. Y. He resigned some time ago as vice-president and general manager of the Des Moines (Ia.) City Railway and vice-president and general manager of the Inter-Urban Railway, Des Moines. Mr. Hewitt, as noted in the ELECTRIC RAILWAY JOURNAL of May 18, 1912, has been connected with the Elmira Water, Light & Railroad Company, Elmira, N. Y., as superintendent; with the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., as general superintendent, and with the East St. Louis & Suburban Railway, East St. Louis, Ill., as general superintendent.

Mr. David W. Houston, whose appointment as superintendent of the Regina (Sask.) Municipal Railway was noted in the ELECTRIC RAILWAY JOURNAL of June 20, was born in Bathurst, N. B., Jan. 3, 1879. He entered transportation service in July, 1899, and until 1902 was clerk with the Chicago, Burlington & Quincy Railroad, Omaha, Neb. From 1902 to 1907 he studied at the School of Mining, Queen's University, Kingston, Ont., being graduated therefrom with the degree of B.Sc. From May to October, 1907, Mr. Houston was inspector of mining claims, Ontario Government, Montreal River District. In 1908 he became auditor and acting manager of the Tabor & Northern Railway, Tabor, Ia., which position he left in July, 1913, to become assistant superintendent of the Regina Municipal Railway. From March 12, 1914, Mr. Houston was acting superintendent of this line.

Mr. C. S. Banghart, superintendent and master mechanic of the New York & Queens County Railway, Long Island City, N. Y., has been appointed general manager of the Binghamton (N. Y.) Railway. Mr. Banghart has been superintendent of the New York & Queens County Railway since October, 1908, at which time he had been master mechanic of the company for five years. His first railway position was with the line department of the Allentown & Bethlehem Traction Company, after which he was engaged in the electrification of the Union Railway, New York, for the Thomson-Houston Company. Later he joined the M. A. Greene Engineering Company, Allentown, Pa. In 1895 he became master mechanic of the Union Traction Company, Reading, Pa., which position he filled until his connection with the New York & Queens County Railway. Mr. Banghart will take up his duties at Binghamton on Sept. 1.

OBITUARY

William E. Clark, representative of the Rail Joint Company, New York, N. Y., died July 5. Mr. Clark was born in Manchester, Mass., Nov. 5, 1847. After service in the Civil War he engaged in railroad bridge building. Later he served as roadmaster for the Connecticut division of the Boston & Maine Railroad for nearly twenty-five years. About 1897 he accepted the position with the Rail Joint Company.

James W. Benham, secretary and treasurer of the Naugle Pole & Tie Company and president of the Northern White Cedar Association, was killed on July 27 in an automobile accident. Mr. Benham was born in Minneapolis, Minn., in 1866 and received his early education in San Francisco, Cal. While still a youth he went into Arizona and became identified with the cattle industry. He became a Legislator, a member of the first livestock sanitary board and a member of the first forestry organization of Arizona Territory. In 1901 Mr. Benham went into business in New York City. He moved to Chicago in 1906 and became a member of the Naugle Pole & Tie Company, then a partnership. When it was incorporated in 1910 he was made secretary and treasurer.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Alton & Jacksonville Railway, Alton, Ill.**—Incorporated in Illinois to build an electric railway between Alton and Jacksonville. The incorporators and first board of directors are: Frank L. Butler, Wade T. Meloan, James S. McClellan, Harry Okin, Louis W. McIntyre, Berthold P. Bergold and Jerome J. Cermak.

Pekin (Ill.) Street Railway.—Application for a charter has been made by this company to take over the present railway system in Pekin, and it is the intention, if the City of Pekin does not favor municipal ownership, to improve the line and extend it to the Mineral Springs Park. The company has made an offer to sell to the city, but will apply for a franchise if municipal ownership is voted down. Capital stock, $15,000. Incorporators: W. E. Lautz, D. D. Velde and W. P. Herget.

***Richmond-Hamilton Traction Company, Richmond, Ind.**—Application for a charter has been made by this company in Indiana to build an electric railway from Hamilton, Ohio, to Richmond, Ind. Partial surveys have already been made. Capital stock, $10,000. Directors: Eugene Purtelle, E. Leslie Cole and F. C. Gillen.

***San Marcos Interurban Railway, San Marcos, Tex.**—Incorporated in Texas to build an electric railway in San Marcos. Capital stock, $2,000. Incorporators: G. J. Merritt, Justin Merritt and Thomas Merritt.

Detroit, Pontiac & Owosso Railway, Owosso, Mich.—Incorporated in Michigan to build an electric railway to connect Pontiac, Owosso, Clarkston, Detroit and Fenton. Capital stock, $50,000. Oliver Lau, Detroit, is interested. [E. R. J., March 14, '14.]

***Dodge County Electric Railway, Madison, Wis.**—Chartered in Wisconsin to build an electric railway to connect Mayville, Horicon, Juneau, Beaver Dam and Columbus. Capital stock, $25,000. Incorporators: Charles R. Roberts, I. B. Luther and Charles D. Smith.

FRANCHISES

Victoria, B. C.—The British Columbia Electric Railway has asked the Council for a franchise to double-track its line on Esquimalt Road between Dundas Street and Catherine Street in Victoria. The company plans to build a double track on the entire line from Point Ellice bridge to the terminal.

Healdsburg, Cal.—The Board of Supervisors will open bids on Sept. 10 for the sale of the franchise of the proposed electric line which extends from Healdsburg to Alexander and Dry Creek Valley. A. D. Bowen and associates plan to extend this line from Dry Creek to Cloverdale. [E. R. J., July 25, '14.]

San José, Cal.—The San José Railway has asked the Council for a forty-two-year franchise in San José for a line from East San José to Kirk Avenue in San José.

Miami, Fla.—The Miami Traction Company has received a franchise from the Council to build a 2½-mile electric railway in Miami. B. B. Tatum is interested. [E. R. J., June 13, '14.]

Peoria, Ill.—The Peoria Railway has received a franchise from the Council to double-track its line on Main Street from Elizabeth to Western Avenues in Peoria.

Lafayette, Ind.—The Lafayette & Northwestern Railroad has asked the Board of Supervisors for a franchise in White County to build an electric railway through Round Grove, Princeton and West Point. This line will connect Lafayette and Chicago via Rensselaer, Hammond, Princeton, Round Grove and West Point. [E. R. J., July 25, '14.]

Lafayette, Ind.—The Indiana & Northwestern Traction Company will ask the Board of Supervisors for a franchise through White County.

Hopkinsville, Ky.—On August 22 a twenty-year franchise, providing for an electric railway and giving the right to sell current for light and power, will be offered for sale to the highest bidder. This step was taken at the request of R. E. Cooper, who represents Eastern interests. Recently an interurban franchise was ordered sold in the same way by the local court. It is said that there are ample means to back the proposition and it is believed by some that this is part of an interurban traction plan, probably in connection with one of the companies already interested in this section of the country.

Alexandria, La.—The Southern Traction & Power Company has asked the Council for two franchises to extend its lines on Sixteenth Street to the city limits and on Thirteenth Street to Marye Street in Alexandria.

Shreveport, La.—The Shreveport Traction Company has bought two electric railway franchises from the Council in Shreveport, one to extend the present Fairfield line and the other to extend the franchise for the existing track in Shreveport.

Augusta, Maine.—The Lewiston, Augusta & Waterville Street Railway has received a franchise from the Council to extend and improve some of its lines in Augusta.

Bangor, Maine.—The Bangor Railway & Electric Company has asked the Council for a franchise to double-track its line on Central Street and through Post-office Square in Bangor.

Revere, Mass.—The Bay State Street Railway has asked the Council for a franchise for an alteration and relocation of its tracks on Beach Street and Central Avenue in Revere.

Westfield, Mass.—The Springfield Street Railway has asked the Council for a new location of tracks on the Springfield highway from the West Springfield town line to a point east of Frog Hole.

Elizabeth City, N. C.—T. J. Markham and associates have received a franchise from the Board of Aldermen to build an electric railway in Elizabeth City. This is part of a plan to build an electric line to connect Weeksville, Nixontown, Elizabeth City, South Mills, Deep Creek and Norfolk. [E. R. J., June 6, '14.]

Raritan, N. J.—The application of the Jersey Central Traction Company for approval of an ordinance of Raritan Township, Monmouth County, giving permission to the company to operate an electric railway in Raritan, has been granted by the Board of Public Utility Commissioners.

Buffalo, N. Y.—The Buffalo & Lake Erie Traction Company has received a franchise from the Council for new track in State Street from Twelfth Street to Turnpike in Buffalo.

Jefferson, Ohio.—The Chardon, Jefferson & Meadville Interurban Railway has received a franchise from the Council in Jefferson. This 30-mile line will connect Chardon, Hampton, Fontville, Rock Creek and Jefferson, Ohio, and Linesville, Pa. [E. R. J., June 20, '14.]

Portland, Ore.—The Portland & Oregon City Railway has asked the Council for a franchise from Oregon City to Portland via the East Side.

Harrisburg, Pa.—The Harrisburg & Mechanicsburg Electric Railway has received the approval of the Public Service Commission for an extension of its route in Harrisburg. The company will now ask the Council for a franchise to build the line.

Nashville, Tenn.—The Nashville Traction Company has asked the Council for a franchise along the Murfreesboro pike in Nashville. [E. R. J., July 18, '14.]

Temple, Tex.—The Southwestern Traction Company has received a franchise from the Council to extend several of its lines in Temple.

TRACK AND ROADWAY

Fresno (Cal.) Interurban Railway.—The Railroad Commission has rendered a decision granting this company until Oct. 1 to secure a franchise through Clovis. The securing of this franchise was one of the conditions of the Commission's recent order authorizing the railway company to issue $120,000 of bonds and 600 shares of stock.

Montecito Railroad, Los Angeles, Cal.—Application has been made by this company to the Railroad Commission asking authority to issue and sell 50,000 shares of its authorized capital stock at the rate of 90 cents a share. The company proposes to construct an electric railway from the north end of Griffin Avenue, Los Angeles, to the summit of Montecito Hill, a distance of 2¼ miles. The company also plans to acquire certain property at the upper terminus of the line to be used as an amusement park. [E. R. J., July 25, '14.]

Pacific Electric Railway, Los Angeles, Cal.—Plans have been completed and work will be begun at once by this company on the extension of its elevated railway from the company's Sixth Street station to San Pedro Street, via Maple Avenue in Los Angeles.

***Bay Shore Railroad, San Diego, Cal.**—This company has applied to the Railroad Commission for a certificate of public convenience and necessity authorizing it to construct an electric railway from the intersection of Voltaire Street and Bacon Street, San Diego, northeasterly across the entrance of False Bay to Pacific Beach. The authorized capital stock of the company is $200,000, of which $7,000 has been subscribed. Upon being granted the necessary franchises and permits, the company proposes to apply to the Railroad Commission for authority to issue sufficient capital stock to finance the project.

***Jesup, Ga.**—A stock company that will be capitalized at $10,000 is being organized at Jesup to build an electric line between Jesup and Doctortown. M. Arlino, Jesup, is among those interested.

Urbana & Champaign Railway, Gas & Electric Company, Champaign, Ill.—This company will build an extension of its lines to the new shops of the Illinois Central Railway located 2 miles north of Champaign. It is reported that this company will build a loop through a new residence district of Urbana adjacent to the University of Illinois.

Kankakee & Urbana Traction Company, Urbana, Ill.—The Public Service Commission has authorized this company to sell $213,000 of preferred capital stock for the purpose of extending its line from Rantoul to Paxton.

Evansville & New Harmony Traction Company, Evansville, Ind.—Bonds to cover the cost of construction of this line will be first offered for sale in Cynthiana, Ind., one of the cities along the proposed route. After Cynthiana, other towns lying between New Harmony and Evansville will be visited by the promoters of the company, and those which offer the best support will be included on the routing of the new line. [E. R. J., July 25, '14.]

Public Utilities Company, Evansville, Ind.—Residents of the West Side have prepared a petition asking this company to extend its line on Franklin Street from Fulton Avenue to Mary Street in Evansville. This would give a direct route between the North and West Sides. A committee from the North Side Business Men's Association has been appointed to work in favor of the extension.

Interstate Bridge & Terminal Company, Muscatine, Ia.—Plans are being considered by this company to build an electric railway between Muscatine and Galesburg, Ill., and a bridge across the Mississippi River.

Southern Traction Company, Bowling Green, Ky.—This company, which recently purchased the Bowling Green Street Railway Company's property, has begun extension of its lines and has placed a large order for new rails. The first extension will apply to the Broadway line. Rather extensive improvements are being made by the new owner of the property.

***Thibodaux, La.**—Plans are being considered to build a 40-mile electric railway between Lockport, Thibodaux and Donaldsonville. Right-of-way has been obtained between Lockport and Thibodaux. Among those interested are: L. P. Caillouet, H. S. Smith and Alfred Picot, Thibodaux, and Walter Ohimeyer, Plattenville.

Hagerstown & Frederick Railway, Frederick, Md.—The interests which control this company have recently purchased the Frostburg Illuminating & Manufacturing Company, which is the first step toward the building of an interurban electric railway to connect Johnstown, Frostburg, Cumberland and Hagerstown. Surveys have been made for an extension to Hancock.

Grosse Isle Railway, Detroit, Mich.—This company, which plans to build a 10-mile electric line around Grosse Isle, has completed a new bridge below Wyandotte at a cost of $250,000. It has not yet been decided when construction of this line will be begun. E. W. Voigt, Butler Building, Detroit, president. [E. R. J., Nov. 4, '11.]

Detroit, Pontiac & Owosso Railway, Owosso, Mich.—The State Railroad Commission has authorized this company to issue $3,000,000 in bonds. The company was recently incorporated to build an electric railway from Owosso to Detroit. This company will obtain the power to operate its proposed line from the Independent Power Company, Fenton. [E. R. J., March 14, '14.]

Columbia (Mo.) Railway.—Preliminary arrangements are being made by this company to build an electric railway to connect Jefferson City, Mexico, Fulton, Montgomery City, Columbia, Fayette and Glasgow. W. J. Delaney, St. Louis, is interested. [E. R. J., July 18, '14.]

Dover, Somersworth & Rochester Street Railway, Dover, N. H.—Plans are being considered by this company for an extension from Dover to Portsmouth via the New Hampshire side of the river.

Hiawassee Valley Railway, Andrews, N. C.—Preliminary arrangements are being made by this company to begin work within the next few weeks on the 35-mile line from Andrews to Hiawassee, Ga., via Hayesville, N. C. J. Q. Barker, Andrews, N. C., is interested. [E. R. J., Feb. 28, '14.]

New Bern-Ghent Street Railway, New Bern, N. C.—An extension several miles beyond New Bern is being considered.

Williston & Northern Electric Railway, Williston, N. D.—Surveys have been completed and contracts will soon be awarded by this company to build its 60-mile line from Williston north along the west side of Little Muddy Valley. A. H. Brown, president. [E. R. J., June 6, '14.]

East Liverpool Traction & Light Company, East Liverpool, Ohio.—Plans are being made to extend the Pleasant Heights line about 1½ miles in East Liverpool.

Dayton (Ohio) Street Railway.—Plans are being made by this company soon to build an extension from Philadelphia Drive to Fort McKinley in Dayton.

Hocking-Sunday Creek Traction Company, Nelsonville, Ohio.—Application has been made to the Public Utilities Commission by this company for permission to issue $300,000 of bonds to run twenty years and draw 6 per cent interest. It is stated that of the 14 miles of proposed track between Nelsonville and Athens, about half has been completed and that the returns from operation over this portion will not pay the interest charges. The company proposes to use the money secured by the bond issue to complete the line and refund present obligations.

Windsor, Essex & Lake Shore Rapid Railway, Kingsville, Ont.—The Windsor City Council has asked this company to remove its tracks on Howard Avenue, from the side to the center of the road. The city has let a contract for paving the avenue, and the proposal is that the tracks will be moved while this work is in progress.

Pease River Tramway & Navigation Company, Ottawa, Ont.—Adequate financial arrangements have been made by this company to build an electric railway from Smith's Landing, on Pease River, to Port Smith, on the northern boundary of Alberta, and a line from Vermilion Rapids easterly along the northern bank of the Pease River to Vermilion Falls, with branch lines. D. A. Thomas is interested. [E. R. J., Jan. 24, '14.]

Rainy River Radial Railway, Ottawa, Ont.—The Dominion Parliament has granted an extension of time to this company in which to begin the construction of its projected railway in the Rainy River district.

Pacific Power & Light Company, Astoria, Ore.—This company has a portion of the grade stakes set for the extension of the railway to Taylor's Addition, but the work has not been completed. Nothing can be done at present on the extension of the line to Alderbrook, until the city shall have completed certain street improvements in Uppertown. The extension to Taylor's Addition will be rushed as rapidly as possible.

***Roseburg, Ore.**—Plans are being considered to build an electric railway between Roseburg and Marshfield.

Hershey (Pa.) Transit Company.—Contracts have been awarded by this company, for a 10-mile line between Hershey and Elizabethtown, to the King, Evans, Riley Company, Pottsville, Pa. This extension will be known as the Elizabethtown & Deodate Railway.

Northwestern Railways, Meadville, Pa.—This company has awarded a contract to the Erie Steel & Construction Company for the relaying of tracks from Cambridge Springs to Meadville. Work will be begun at once.

Reading, Birdsboro & Pottstown Railway, Reading, Pa.—Surveys have been completed and work will soon be begun by this company on the 18-mile electric railway to connect Reading, Millmont, Flying Hill, Gibraltar, Birdsboro, Baumstown, Weavertown, Amityville and Stowe, where it will connect with the line of the Pottstown Traction Company. The route as surveyed goes through private right-of-way for its entire distance. This is part of the project which contemplates the construction of a bridge across the Schuylkill River at the foot of Sixth Street, Reading, the company taking advantage of a charter granted a dozen years ago. Abbott Witman, general manager.

Wilkes-Barre (Pa.) Railway.—Work will be begun at once by this company on the extension of its Avoca line from the present terminus at the boundary between West Avoca and Duryea to the Lehigh Valley Railroad cut-off tracks. This will bring the line within a short distance of Main Street, Avoca.

Glengarry & Stormont Railway, Montreal, Que.—This company, which plans to build a 27-mile line between St. Polycarpe and Cornwall, Ont., will operate the railway by steam and not by electricity. G. W. Farrell, Montreal, Que., president.

Three Rivers (Que.) Tramway.—Interest has been revived in the construction of an electric railway in Three Rivers. James Bennett, Three Rivers, is interested. [E. R. J., Oct. 12, '12.]

Nashville Railway & Light Company, Nashville, Tenn.—This company has decided to extend its Fatherland Street line to the entrance of Shelby Park in Nashville.

Dallas (Tex.) Consolidated Electric Railway.—As soon as the material ordered arrives this company will begin work double-tracking its line from Main Street and Lamar Street to Elm Street in Dallas.

Southern Traction Company, Dallas, Tex.—During the fall of 1914 this company will build the connecting line between the Corsicana and Waco division. It will connect Waxahachie and Ferris, a distance of 15 miles.

Houston (Tex.) Electric Railway.—This company is asked to consider plans to double track its line on Fannin Street, and Travis Street from Franklin to Dallas Avenue and to route all of its lines over that loop, which will embrace all of the business district in Houston.

Southwestern Traction Company, Temple, Tex.—Plans are being made by this company to begin work on several extensions within the next few weeks in local territory now unprovided with transportation facilities. The first extension will be to the hospital on Bentley Hill, and material for same has been ordered. Among other improvements contemplated is a thirty-minute service on the interurban between Temple and Belton.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—An extension of this line to Saratoga Springs, Utah, is being considered.

Everett Railway, Light & Water Company, Everett, Wash.—It is reported that this company plans to extend its line in Lowell.

Washington Water Power Company, Spokane, Wash.—This company will extend its Bonne Avenue line as soon as it receives a franchise from the Council for the extension in Spokane.

Wheeling (W. Va.) Traction Company.—Work has been begun by this company on the extension to Warwood.

SHOPS AND BUILDINGS

British Columbia Electric Company, Vancouver, B. C.—This company has awarded a contract to the Westinghouse, Church & Kerr Company to build a new carhouse at Fourteenth Avenue and Main Street in Vancouver. The cost is estimated to be about $300,000.

Washington Railway & Electric Company, Washington, D. C.—Plans are being made by this company to expend about $3,000 on repairs at its carhouse at Tenth Street and Florida Avenue, N. W., in Washington.

Bloomington & Normal Railway & Light Company, Bloomington, Ill.—This company is asked to consider plans to remove its carhouse on North Park Street in Bloomington.

Public Service Railway, Newark, N. J.—This company has awarded the contract to the Hedden Construction Company to build its new eight-story terminal building in Newark. Provision is made for every department of the various Public Service Corporation activities. Including the subway, the concourse, which will be at the ground level, and the elevated train floor, the new building will provide nearly 9 acres of floor space. Above the elevated train floor the structure will rise six stories, all of which will be used by the corporation and its affiliated railway, gas and electric companies.

Piedmont & Northern Railway, Charlotte, N. C.—Plans are being made by this company to build a new depot and warehouse in Spartanburg. The structure will be 108 ft. x 110 ft. The cost is estimated to be about $40,000.

Ohio Electric Railway, Cincinnati, Ohio.—Plans are being made by this company to build a new depot on East Main Street in Newark.

Montreal & Southern Counties Railway, Montreal, Que.—This company has received permission from the Montreal Council for improving the city terminals. The company will be allowed to cross McGill Street and establish the terminal on Youville Square in Montreal.

Utah Light & Railway Company, Salt Lake City, Utah.—This company has plans in preparation for the erection of a new freight and passenger terminal station south of the general office building on West Temple Street in Salt Lake City.

POWER HOUSES AND SUBSTATIONS

Southern Iowa Railway & Light Company, Centerville, Ia.—One 200-kw, 600-volt, three-phase, sixty-cycle, 1200 r.p.m. rotary converter has been ordered by this company from the Westinghouse Electric & Manufacturing Company.

Detroit (Mich.) United Railway.—Plans are being made by this company to build a new power plant in Detroit. Contracts for the work will soon be awarded.

Northern Ohio Traction & Light Company, Akron, Ohio.—One 5000-kva, three-phase, sixty-cycle, 22,000-volt high tension, 2300-volt low tension O. I. W. C. transformer has been ordered by this company from the Westinghouse Electric & Manufacturing Company.

Lake Shore Electric Railway, Cleveland, Ohio.—An order has been placed by this company for three 185-kva, single-phase, twenty-five-cycle, 17,350-volt high tension, 456-volt low tension O. I. S. C. indoor transformers and one 15-kw induction motor generator set for exciter service. This apparatus will be installed by the Westinghouse Electric & Manufacturing Company.

Hershey (Pa.) Transit Company.—This company has completed the addition to its substation in Hershey.

Northern Texas Traction Company, Fort Worth, Tex.—This company will install at its power house in Fort Worth one 1000-kw, 600-volt, six-phase, twenty-five-cycle, 750 r.p.m. commutating pole rotary converter; three 367-kva one-phase, thirty-five-cycle, 15,000-volt O. I. S. C. transformers. The apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Charleston (W. Va.) Interurban Railway.—This company has placed an order for one 300-kw, 600-volt, three-phase, sixty-cycle, 1200 r.p.m. rotary converter; three 110-kva, sixty-cycle, OISC transformers, 6600-volt high tension to rotary and one switchboard to control same. The apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Manufactures and Supplies

ROLLING STOCK

Empire United Railways, Syracuse, N. Y., is in the market for twelve interurban cars.

Rio De Janeiro (Brazil) Tramways is reported as expecting to purchase 250 cars.

Connecticut Company, New Haven, Conn., will order within the next few weeks about ninety passenger cars.

Santiago (Cuba) Tramways is reported as having ordered about twenty-five open cars from The J. G. Brill Company.

Albany Southern Railroad, Rensselaer, N. Y., is expecting to purchase one express car and snow-plow and ten 80,000-lb. freight cars.

Canadian Northern Railroad, Toronto, Ont., has ordered six city passenger cars from the National Steel Car Company, Hamilton, Ont.

Third Avenue Railway, New York, N. Y., has ordered twenty-five additional low-level, single-truck, radial axle cars from The J. G. Brill Company, thus making a total of forty-nine cars of this type ordered.

Springfield (Mass.) Street Railway, noted in the ELECTRIC RAILWAY JOURNAL of July 4, 1914, as expecting to purchase ten city passenger cars, has ordered these cars from the Wason Manufacturing Company.

Worcester (Mass.) Consolidated Street Railway, noted in the ELECTRIC RAILWAY JOURNAL of July 4, 1914, as expecting to purchase ten city passenger cars, has ordered these cars from the Osgood Bradley Car Company, Worcester, Mass.

New York Municipal Railway, Brooklyn, N. Y., has been authorized by the Public Service Commission, First District of New York, to purchase 100 additional subway car bodies similar in design to those ordered at the beginning of the year. It is understood that the order will be placed with the American Car & Foundry Company.

Greeley & Denver Railroad, Greeley, Col., noted in the ELECTRIC RAILWAY JOURNAL of July 18 as expecting to purchase two single-truck motor cars, has ordered these cars from the American Car Company. The cars will be mounted on Brill No. 21-E trucks and will be equipped with GE electrical equipment.

Jersey Central Traction Company, Keyport, N. J., has specified the following details for the six center-entrance prepayment cars which were recently ordered from The J. G. Brill Company:

Seating capacity	50
Bolster, centers, length	28 ft.
Length over vestibule,	43 ft. 2 in.
Width over sills	8 ft. 6 in.
Body	composite
Interior trim	cherry
Headlining	Agasote
Roof	arched
Underframe	metal
Air brakes	West.
Axles	hammered steel
Bumpers,	Brill angle-iron, Hedley anti-climbers
Cables	West.
Car trimmings	bronze
Conduits and junction boxes,	West.
Control	West.
Couplers	Brill channel iron
Curtain fixtures	Natl. L. W.
Curtain material	Pantasote
Destination signs	Hunter
Fare boxes	International
Fenders	Philadelphia
Gongs	Brill Dedenda
Hand brakes	Brill
Heaters	Consol.
Headlights	Neal
Motors	4 West. 307-C
Sanders	Ohio Brass air
Sash fixtures	Brill
Seats	Brill Winner
Seating material	cane
Springs	Brill
Track scrapers	Brill
Trolley catchers	Wilson
Trucks	Brill 27 M.C.B. 2X
Wheels	Midvale

TRADE NOTES

Graphite Lubricating Company, Bound Brook, N. J., regrets to announce the death of its president, Charles H. Libbey, on July 20, 1914.

V. D. Stearns, who has been assistant sales manager of the Lord Manufacturing Company, Brooklyn, N. Y., for the past four years, announces his resignation from this company, effective Aug. 15, 1914.

Naugle Pole & Tie Company, Chicago, Ill., has appointed Laurence E. Morier in charge of the new office which the company has opened at 21 South High Street, Columbus, Ohio. Mr. Morier has been affiliated with the company for the past nine years, having started in the capacity of timekeeper and assistant foreman in the Chicago yards. After three years of this work he was transferred to the North, acting as assistant to the superintendent of Minnesota operations. He was later recalled to Chicago and made a salesman.

Union Switch & Signal Company, Swissvale, Pa., at a recent meeting of its board of directors decided upon certain changes in the business policy of the company and these brought about a number of changes in the personnel of the management, in addition to those which were mentioned in the ELECTRIC RAILWAY JOURNAL of July 25. W. H. Cadwallader has been appointed general manager of the company at Swissvale, Pa. Mr. Cadwallader came to the organization about twenty-four years ago as an office boy. Since then he has worked his way up step by step through various departments by constant attention to business, until he was made assistant to the general manager about a year ago. During the recent changes in the management, he received the promotion to his present position. J. S. Hobson, who had formerly charge of the Western district with headquarters in Chicago, has been appointed as acting sales manager with headquarters in Swissvale, Pa. A. Dean has been appointed to take charge of the Chicago office. All members of the New York office not directly connected with the Eastern sales district will be transferred to the Swissvale office, where hereafter the head sales department will be located. The Eastern sales office at 30 Church Street, New York City, will be in charge of G. A. Blackmore.

ADVERTISING LITERATURE

Goldschmidt Thermit Company, New York, N. Y., has issued a postal showing an interesting illustration of welding repair work done on a large steel crankshaft.

National Tube Company, Pittsburgh, Pa., has issued the second edition of its "National" Bulletin No. 13, which describes and illustrates its iron body brass mounted wedge gate valves.

Chicago Savings Bank & Trust Company, Chicago, Ill., has issued a fifteen-page booklet entitled "A Promise to Pay." This gives a very interesting discussion on the subject of bonds, taking up in turn the definition of the word "bond," the different classes and forms of bonds and the right and wrong ways to buy bonds. The booklet mentions three factors in bond investment, viz.: security, convertibility and interest return, and closes with an outline of the work of the bond department of the bank.

International Steel Tie Company, Cleveland, Ohio, has issued bulletin No. 2, illustrating the most recent development of an installation of a support for crossings at the intersection of the Union Traction Company of Indiana and the Chicago, Cincinnati, Columbus & St. Louis Railway at Muncie, Ind., and at the intersection of the Cleveland, Southwestern & Columbus Railway with the New York Central & St. Louis Railroad at Lorain, Ohio.

St. Louis Steel Foundry Company, St. Louis, Mo., has issued a catalog describing and illustrating its solid cast manganese steel track work for steam and electric railroads. The work illustrated is all machine-ground to template and dimension and is absolutely interchangeable. The types of track work described include protected heel tongue switches of standard and tadpole styles, solid manganese steel point mates, steel railway girder frogs of U-section and double and triple intersection, slot-rail and combination gauge girder crossings, steel layouts and insert castings.

Gould Storage Battery Company, New York, N. Y., has issued an attractive catalog describing its storage battery cars. The bulletin also points out in an interesting way the field of the storage battery car, its powers and its limitations, and explains the small amount of care required for its operation, its low maintenance cost and its general economy. A number of illustrations are shown of the storage battery cars equipped by this company, among them being cars of the Central of Florida Railway, Gardenas Tramway and the Third Avenue Railway. This company has also issued helpful data for figuring on the storage battery proposition in regard to results to be expected from storage battery cars.

PROTECTION BY FLAG ON SLOW-SPEED LINES

A question has arisen as to the scope of the editorial comment appearing in last week's issue about the revival of the old operating rule that permitted train movement under the protection of a flag in advance. Obviously our conclusions were intended to apply only to high-speed service. That city or semi-suburban service, where the train movements are slow, should be hampered by the limitations imposed in the interests of safety upon interurban lines is by no means a necessity, and in view of the fact that signals on slow-speed lines are installed more often for accelerating traffic than for any other reason the rules for operation under them should manifestly permit a considerable degree of flexibility. Certainly when speed is so low that stops can be made in a few score feet, and even when head-on collisions involve no more than crumpled vestibules, there is no reason for the rigid imposition of the precautions necessary for high-speed trains, and the use of somewhat primitive forms of signals which lack the practically perfect reliability of the more elaborate types is entirely logical. Under such conditions it would be unreasonable to hold a train at a deranged signal in stop position until orders were obtained from the dispatcher, because, in the first place, it is seldom that the expense of installing a telephone at every signal is permissible for the traffic involved, and in the second place a signal failure is by no means likely to be such an infrequent occurrence as it is on a completely equipped interurban line.

DEFINING THE LIMITS OF ARBITRATION

Experience shows that in the arbitration of labor disputes one of the most important requirements of a successful proceeding is a preliminary agreement sharply defining the jurisdiction of the tribunal sitting in the case and stating with the utmost clearness the points agreed upon in conference, if any such have been settled prior to the official hearings. Failure to enter into such an agreement opens the door to grave difficulties in the carrying out of the final decision, since the party which considers itself aggrieved by the finding is naturally tempted to challenge the authority of the board unless that authority is put down in black and white in clear-cut terms, understood and accepted by the disputants. Of course, no arbitration can be entered into without mutual agreement of some sort, but this agreement must be perfectly plain as to interpretation and comprehensive within its scope if it is to stand the test of controversy. Too much care cannot be taken to make sure that an agreement to arbitrate a wage issue on an electric railway leaves nothing uncertain with respect to the time when the awarded schedule of pay shall take effect, as to the definition of platform time and method of compensation to be employed, and with regard to any other technical matters the interpretation of which might otherwise be unrestricted. The time and trouble required to start right in such proceedings is well expended, for in the interests of the permanent settlement of specific controversies it is important that no loopholes be left through which disputes may come into being.

RATE DECISION A PARTIAL VICTORY

The recent I. C. C. decision in the Eastern freight rate case, noted elsewhere in this issue, may be considered a partial victory for the railroads, in that they have been allowed a 5 per cent increase in many of the rates requested. On the other hand, the increase in rates is restricted to the Central Freight Association territory, and the longed-for $50,000,000 increase has dwindled down to between $9,000,000 and $15,000,000. It must be admitted that the commission points out paths of economy along which revenues may be further increased, although the availability of such routes is difficult of determination. It is interesting to note the intimation that passenger traffic has not been bearing its full share of railroad expenses. If this is true, an accurate separation of operating expenses as between freight and passenger traffic, according to the recent order of the commission, may prove a most effective means for securing passenger rate increases. A careful perusal of the entire decision shows that the commission has not dealt so harshly with the alleged delinquencies of railroads as predicted in some sources. It more than delicately hints, however, that the propaganda directed toward it as if it had the legislative power to promote general industrial welfare, has been ill-advised, for the law covering rate-making does not embrace general endeavors to restore financial and business confidence. The commission may be correct as to its legal position, but it should not belittle the anxiety with which the public was waiting for the rate decision. Unfortunately for the exact settlement of this question, the effect of the decision cannot be determined on account of present international complications. It is indeed a strange coincidence that this rate decision, which security holders and exchanges have been awaiting with bated breath for several years, should now be handed down when the stock exchanges are closed because of the war in Europe.

EFFECT OF WAR ON FINANCE AND COMMERCE

Ordinary calculations of the effect which the rush of nations against each other now in progress in Europe will have upon American markets, both financial and commercial, seem almost futile, in view of the fact that the present suspension of trade on all the world's exchanges, the collapse of the European credit machinery and the complete upheaval of all international commerce are without precedent in the history of the world. It is no wonder that many American investors and manufacturers look with doubtful eyes toward the future. However, America has already rallied to meet the opportunity offered to her in the face of such unparalleled conditions, and we are sanguine enough to believe that a way will soon be found to ameliorate the situation.

Elsewhere in this issue we have noted the record low prices of American electric railway issues which are traded in on foreign exchanges, brought about through the heavy liquidation before the foreign and New York exchanges closed. This, of course, is temporary, for the foreign investor has been too well educated as to the high investment value of American public utility securities for a market not to be established for them as soon as European conditions again become settled.

So far as the earnings of electric railway companies in this country are concerned, we see little in the foreign complications to affect them. Indeed, this comparative immunity of properties of this kind to outside commercial conditions is one of the advantages which electric railways have always possessed over the steam railroads and general industrial undertakings. With the street railways in the affected district the situation is, of course, far different, the war dispatches from Belgium, for instance, reporting that the lines in Brussels have been brought practically to a standstill, because most of the train force has gone to the front.

In the meantime, the war will change conditions elsewhere. Public utility projects in Asia and South America, which have heretofore depended largely on German and English capital, may find it necessary to make advances that will prove attractive to American capital. London and Brussels have hitherto been the headquarters for enterprises of this kind, Brussels being the headquarters of many of the international syndicates which have controlled tramway enterprises in the southern hemisphere and in the Far East. German capital has also been active in such outside undertakings, particularly when combined with electric light and power supply, working usually through the finance companies which are associated with the large electrical manufacturers of Germany.

Manufacturers of electric railway apparatus in this country, also, may do well to consider the opportunities which the parts of the world which we have mentioned offer. Many of the existing roads of this kind have looked to Germany for their supplies in the past, not only for electrical equipment but for rails, etc., and if American manufacturers are willing to extend the long credits to which these buyers are accustomed, new lines of trade for this country may advantageously be developed.

PAYMENT OF INTEREST ON INCOME BONDS

According to a well-known author on corporation finance, income bonds, while sometimes desirable in reorganization proceedings because they do not impose any fixed charges on a corporation, are quite liable to lead to an acrimonious dispute between the corporation and the bondholders as to whether or not the interest charges are actually earned. Yet this objection, it is stated, can be obviated in part by the insertion, in the bonds, of such a detailed statement of the method by which the net income available for bond interest is to be determined as to make any disagreement on this point impossible. Sound theory this is, assuredly; but how difficult it may be to put it into practice is well exemplified by the present New York (N. Y.) Railways income bond controversy.

As noted in last week's issue of the ELECTRIC RAILWAY JOURNAL, a suit has been brought against the New York Railways by the New York Life Insurance Company, on the ground that the railway has retained from its bondholders interest which ought to be paid on its 5 per cent non-cumulative income bonds. The point is made that the reserve for injuries and damages is greatly in excess of the total actually expended, although the actual amount of excess is unknown to the plaintiff. According to the bondholders, the indenture provides that the unexpended reserve for injuries and damages for any six months shall be automatically returned to income and shall be applicable to interest on the income bonds. The company contends, however, that the indenture does not make such a step obligatory, and the resulting deadlock can be broken only by the adjudication of the present suit.

While waiting for this decision we may well call attention to another income bond interest dispute, which was decided a few years ago. Holders of the 1895 reorganization income bonds of the Central of Georgia Railroad alleged that the profits of a subsidiary, the Ocean Steamship Company, whose stock was almost entirely owned by the railroad, had been appropriated by the railroad under the fiction of "loans," so that the subsidiary earnings did not appear at all in the form of dividends declared in the income statement of the railroad. The decision of the court, which was rendered after long and hard-fought litigation, was in favor of the complaining bondholders, it being clear that the subsidiary corporation was here used as a device to prevent the income bondholders from securing profits justly accrued. It is easily conceivable that in cases of this character, where income bondholders are dealing with corporations carrying on several activities, care must be taken lest through the separate companies earnings be diverted from rightful creditors to the stockholders.

Besides such a case, however, the present New York Railways suit is based upon a pretext almost puerile. At best the issue resolves itself into one of judgment concerning the operating needs of the company and its accounting principles, on which points the right of the insurance company to act as judge is not wholly comprehensible. It may be that the reserve of 8 per cent of the passenger revenue maintained since Jan. 1, 1912, is slightly excessive. As noted elsewhere in this issue, an engineering determination of the exact amount required was 7½ per cent, but the Public Service Commission ruled that the company could not make any retransfer to surplus until all 1913 claims had been liquidated, moreover, that it was "wiser to manage a company over-conservatively and have a little margin of safety than to attempt to share the divisible profits down to the last tenth of 1 per cent."

Under the New York State law accident claims may be filed any time within three years after the date of accidents, so that the number of claims that may be made against a company for a given year is indeterminate until that time has elapsed. The New York Railways has now been in operation as a reorganized company for a little more than two years, and for it now to pay back a portion of its accumulative reserve would seem to be an unwise procedure. With a company which has been in operation for a long time it may be possible to work to a very close margin in matters of this kind, but we are inclined to believe that even in such a case a broader margin would tend to a greater uniformity of income bond interest.

COMMITTEE ACTIVITY

This is the period of the year when the American association committees are completing their reports, and it seems an appropriate time for this reason to review some of the aspects of committee activities.

Appointment upon one of the many committees of the American Electric Railway Association should be an incentive for earnest endeavor on the part of the individual so assigned, not for the reason that his ability was considered sufficient to warrant the appointment but because a threefold opportunity has been opened to him. In the first place it is an opportunity to participate in activities which have for their basis a much wider range than exists in the individual property and which are, therefore, the principles of the business of street railway transportation as it has been developed to the present date. In the second place the broader vision derived from such participation offers a means of strengthening the company with which the member is associated. The third opportunity is that of self-improvement. If every advantage is taken of the interchange of ideas among the members of the committee old facts assume new appearances, and the flow of original thought is likewise stimulated.

Committee members should realize that the reports submitted to the annual conventions ought to mark milestones of progress on the particular subjects with which they are concerned, and such a result can be obtained better by quality than quantity.

After the appointment of committees the up-to-date chairman should endeavor by correspondence to arrange for a meeting, at which all members could be present, as early as possible. Every effort should be made to insure a full meeting by inter-communication among members until a common date is determined upon. The time which any committee can have in meeting is very limited, consequently it is of such value that it should not be wasted. A rough outline ought to be prepared so that progress might start from the first meeting, instead of using this meeting to review the previous history of the subjects assigned. The meeting should then, if the right men have been chosen, become a clearing house of ideas.

An important qualification for committee work is the get-together spirit, the ability to seize upon the other fellow's thoughts or practices and examine them in good faith, not to find the weak points but to detect the strong points. Oftentimes the subjects assigned to a committee are wide and quite far-reaching. It is more a sign of strength than weakness in the committee if it deliberately postpones investigation on one or more subjects for the ensuing year and concentrates its energy upon what seems best adapted to the experience and make-up of the committee.

In committee reports the desirable feature is definiteness of aim and concreteness of recommendation. Presumably each committee is appointed with a definite object and its work is satisfactory only if it accomplishes definite results. Committees with indefinite commissions are likely to fail of real accomplishment and to become useless cogs in the association machinery.

THE WAR AND ELECTRIFICATION

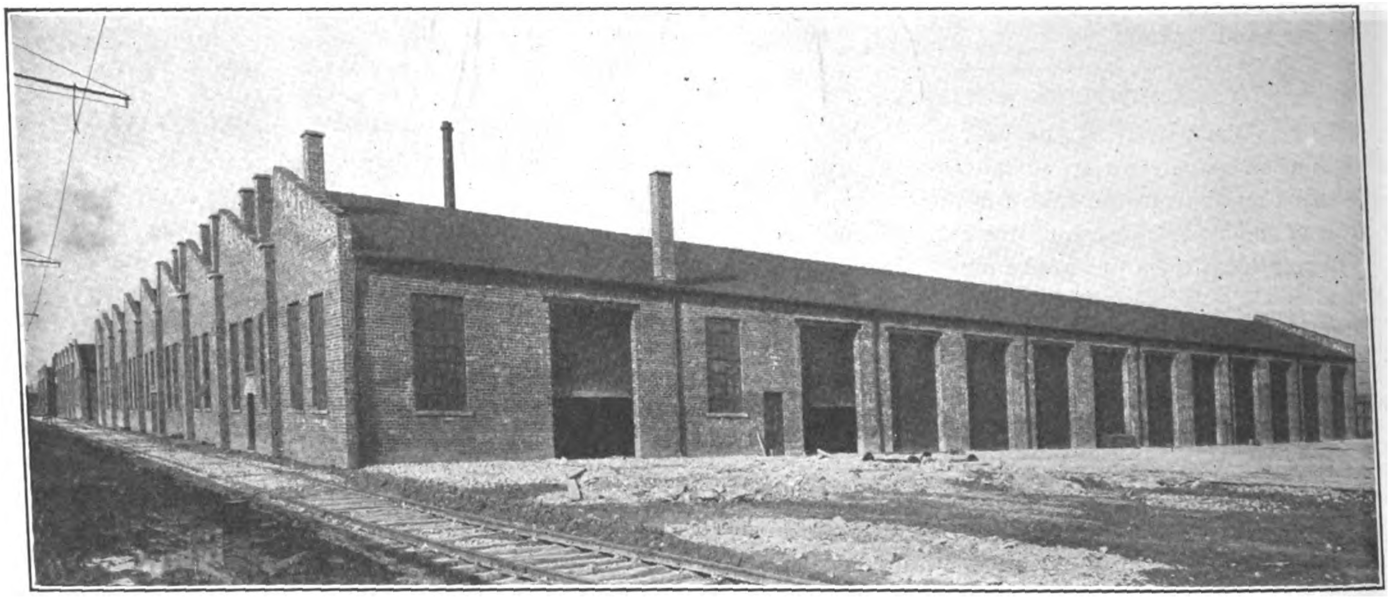
Among the many large engineering improvements which will be seriously delayed because of the great war now in progress on the Continent are the electrifications of steam railroads in Germany, France and other countries. The greatest delay may be expected in Germany partly because of the diversion of government funds to war purposes and partly because of the fact that the latest electrification, that in Silesia, is close to the Russian border. In any event, the railroads will be so overcrowded because of troop and provender transportation that no such interruptions as are incident to a change from steam to electricity would be permitted. It is doubtful, also, whether the Stadtbahn electrification will be furthered in a time of such financial stress.

In France, where the privately owned Midi Railway has taken the lead in electrification, less delay may be experienced because there is no dependence on government funds for the change and the lines are at a great distance from the war zone. It is questionable, however, whether the suburban electrifications of Paris will be continued at this time. Russia also was reported to have in hand great electrification projects which will now have to be postponed. Even if Italy, Spain, Sweden, and Norway succeed in maintaining their neutrality, the electrifications planned in those countries will be held up for two reasons: diversion of government funds, and assignment to army duty of the most vigorous and technically trained men in the country. In general, the Continental countries give preference to retired soldiers for railway workers; therefore the men who would build and operate the electrified roads are among the first reservists to be called back to the colors. No matter from what angle the situation is viewed, even a very short war must mean a serious delay to the electrification of steam railroads in Europe.

New Repair Shops at Louisville

These Shops in Their Fireproof Construction, Sawtooth Roofs for Natural Lighting, Mercury Vapor Lamps for Artificial Illumination, Thorough System for Transporting and Storing Materials and Other Features Are a Worthy Example of Modern Car Maintenance Standards

Positive evidence of the healthy growth of an electric railway is exemplified in its demand for larger and more modern repair shops and generating stations. This is particularly applicable to the Louisville Railway, Louisville, Ky., which recently completed the power station, described in ELECTRIC RAILWAY JOURNAL of Feb. 21, 1914, on page 402, and has now just completed its new general repair shops. Like the generating station, the new shops represent the best modern practice in electric railway shop construction and arrangement. Their necessity was brought about by the overcrowding of the existing shop buildings, the first of which was built in 1897. Although centrally located, the expansion of this lay-out was limited by the high price of surrounding real estate. The new shops are almost as centrally located as the old ones, but have the additional advantages of being on the same property as the largest carhouse and in a factory district where property for future expansion may be had at a fairly reasonable price. Furthermore, the new plant lends itself more readily to progressive shop movements, resulting in greater economy in shop operation.



LOUISVILLE SHOPS—FRONT VIEW OF REPAIR SHOP TAKEN BEFORE SHOP WAS OCCUPIED

Three important city car lines reach the site which is a strip of property 277 ft. wide x 1221 ft. long, immediately in the rear of the Twenty-ninth Street and Broadway carhouse and fronting on Garland Avenue. This location is only 1½ miles from the center of the business district, so the dead mileage from all lines is quite small. While situated in the manufacturing district as noted, the shops are also quite near a desirable home district where the employees live.

General Lay-Out

Prior to deciding on the design of these shops, the construction and mechanical departments of the Louisville Railway made a survey of other shops in the Central States territory to obtain information on general lay-outs, equipment and methods. To a certain extent the dimensions of the property, which had already been bought, limited the character of the general plan. This land included a 277-ft. strip of property more than 1000 ft. in length and extending between two parallel streets occupied by important street railway lines.

Many different groupings of buildings which could be constructed on the proposed site were considered. One scheme included grouping the buildings along one side of the property with track entrances from the opposite side by way of a ladder track. This plan was not deemed practicable because of the larger number of turn-outs necessary as well as the reduction in the property area available for the shops. Another plan provided for grouping the shop buildings along each side of the property, with transfer tables and pit between the two groups. This arrangement reduced the depths of the buildings to a point where the tracks were too short and so would have seriously retarded car movement. Any shift as the car progressed through the various shop departments would require the use of a transfer table. Many other lay-outs were considered, but the one finally adopted and illustrated herewith included three main shop buildings occupying the center of the property with an aisle on each side to provide for run-around tracks. Two aisles, 74 ft. in width, separated the three buildings which formed the shop group. These aisles between the buildings were occupied by two 46-ft. transfer tables with 14-ft. walkways between the edges of the shallow transfer-table pit and the buildings.

Since one end of the shop property was occupied by the Twenty-ninth Street and Broadway carhouse, the shop lay-out was designed with the main shop entrance at the Garland Avenue or opposite, end of the property. This entrance included two turn-outs, one on each side of the property leading from the track in Garland Avenue and connecting to a ladder track paralleling the front of the repair shop. That part of the special work in the street was laid with 9-in. 149-lb. grooved rail and that on the property with 108-lb., 7-in. rail, all of which was furnished by the Buda Company. This lead also

LOUISVILLE SHOPS—GENERAL PLAN, SHOWING SIZES AND RELATIVE LOCATIONS, TRACK FACILITIES, ETC.

connects to run-around tracks each side of this building, one being so connected to the ladder track as to provide a wye track for turning cars.

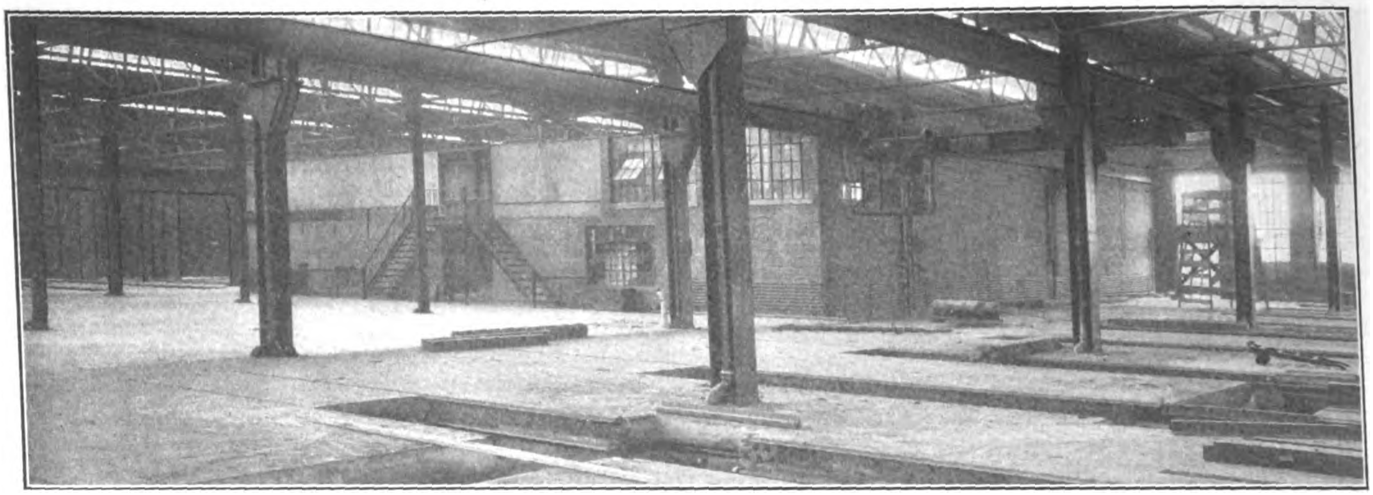
REPAIR SHOP ARRANGEMENT

Eleven tracks lead into the repair shop, and the relative location of the ladder track and the front of the building provides clearance for two cars on each, outside of the building. Only two of these ladder tracks extend through the repair shop building, the other nine stub-ending approximately two car lengths, or 80 ft., inside the entrances. In a similar way eleven tracks enter the rear end of the repair-shop building. Two of these are the through tracks from the front entrance, and the other nine are short sections of track sufficient in length to store two cars inside the building.

Each short track passes over an inspection and repair pit, each equipped with pit hoists fitted with two 24-ft. I-beams which recede into slots in the reinforced concrete floors. These hoists occupy the building entrance end of each inspection and repair pit. From this point defective trucks are run to the inner end of the repair pits where the motors or other truck parts may be removed by the 10-ton Whiting bridge crane, or a jib crane with a 14-ft. beam attached to the building column. From this point they are deposited on a small truck mounted on a narrow-gage industrial railway and transported to the various sections of the repair department. The repair shop proper occupies the central floor space of the repair shop building and extends from an inclosed storeroom, 79 ft. by 87 ft. in plan, at one end to the building wall at the other. The blacksmith shop occupies the corner of the repair shop building beside the Garland Avenue track entrances, the machine shop and armature room the central portion of the building, as well as the corner beside the rear track entrances.

As shown in the illustrations this shop area is contained in one large room with the exception of the storeroom, which is separated from the rest of the building by a 15-ft. brick partition wall. This arrangement permits the repair shop foreman to get a clear view of the entire floor area including the machine shop, blacksmith shop and armature repair departments. The advantage of the short stub tracks leading in from both sides of the repair shop building, each equipped with a pit car hoist, is the number of cars which may be handled at one time. In case several cars are undergoing a general overhauling, they may be run to the transfer table between the repair shop and carpenter shop, and set on any open track at the rear of the repair shop building, where the body is raised from the standard trucks, set on dummy trucks and shifted to the carpenter department for body work. At the same time the stub tracks at the front end of the building, or nearest the street, may be used for emergency repair work, such as changing trucks, adjusting brake equipment or making other slight repairs to the electrical equipment. In other words, it is the intention to keep these front tracks for handling rolling stock which is in the shop only for slight repairs, and those at the rear of the building for general overhauling purposes. In addition to the pit hoists a truck transfer table intersecting four tracks and of 10-ft. width has been provided immediately in front of the repair shop building. This, too, is emergency equipment, being provided to change trucks in case the stub tracks at this end of the building are completely filled with cars undergoing emergency repairs.

The run-around tracks on each side of the shop buildings make it possible to reach any of the buildings without passing through the others or using the transfer tables except for direct entrance to a building.



LOUISVILLE SHOPS—INTERIOR VIEW OF REPAIR SHOP, SHOWING LONGITUDINAL REPAIR PITS, CRANE RUN, ETC.

These run-around tracks were also provided to deliver steam-railroad cars from the track connection near the repair shop site to the several buildings. In order to do this, however, it was necessary to provide a second running rail at standard gage, 4 ft. 8½ in., because the Louisville Railway's lines are all laid with a 5-ft. gage. This difference in gage also necessitated an extra rail on the transfer tables, so that foreign cars can be shifted from one side of the repair shop to the other.

Carpenter Shop

Immediately back of the repair shop is the carpenter shop, which is somewhat smaller in floor area, being 187 ft. x 205 ft. in plan. One corner of this building is set aside for the heating plant, and the remainder of the aisle which this plant occupies serves as space for the woodworking machine tools. The rest of the building is occupied by nine tracks which are continuous from the transfer tables each side of this building, except the one which was stub-ended to provide floor space for a small blacksmith shop, the fare box and curtain repair departments. Four of the through tracks along with the stub-ended track have pits, those under the through tracks being 90 ft. in length and two to each track. All tracks are spaced at 16-ft. centers, thus providing between adjoining track rails an 11-ft. aisle, which is ample for the delivery and removal of material to and from cars undergoing overhauling.

The space provided for woodworking machine tools is ample for present needs, with an allowance for future addition. Each machine is served by an exhaust which connects into an overhead duct leading to the boiler room. The carpenter shop also contains space for a small blacksmith shop, it being provided to make emergency changes in metal fittings or any other light forge work which frequently accompanies car carpentry. The fare-box and curtain departments adjoin the forge room, and are completely inclosed so that they are out of the dust incident to car overhauling. Over these two latter rooms is the shower bath and locker room. It is reached by an ornamental iron stairway, and is inclosed with 8-ft. "Hy-rib" and concrete partitions, with an 18-in. opening along the base. As shown in one of the illustrations, the fittings are complete, and the shower bath room is provided with an individual gas hot-water heater. The lockers are of the usual metal type. Likewise each shop building is equipped with similar shower bath and locker rooms on balconies.

Paint Shop

The paint shop building is separated from the carpenter shop by a 76-ft. aisle, and is 190 ft. wide x 155 ft. long. It is divided into four rooms: the paint shop proper, which occupies the major portion of the building; a washroom, 35 ft. 6 in. x 93 ft. in plan; a varnish room, 35 ft. x 40 ft. in plan, and a stockroom and office, 35 ft. x 20 ft. in plan. The stockroom was built with an underground tank storage system for oils so as to reduce fire hazard as well as insurance rates.

Twelve tracks enter this building from the transfer table, two being stub tracks which lead into the car-washing room while the other ten extend through the building. The tracks in the paint shop proper are at 15-ft. centers, thus providing a 10-ft. aisle between adjoining rails of parallel tracks, and the two tracks in the washroom are of 16-ft. centers. It is not the intention at present to connect the tracks at the rear end of the paint shop building, but when the shop scheme is entirely completed a ladder track will be provided here so that cars may enter the paint shop from either side.

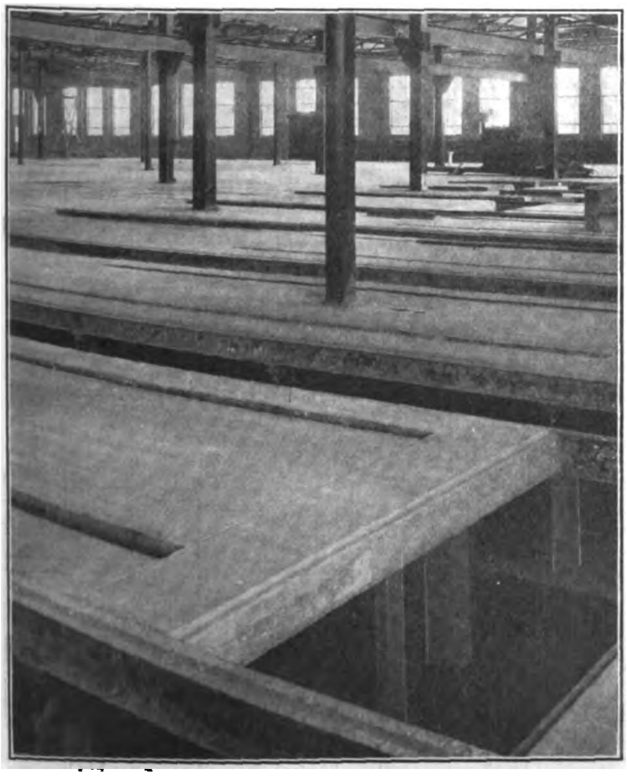
On the east side of the paint shop building are provided a lumber shed and dry kiln, each being served by the east run-around track on one side and a stub-

LOUISVILLE SHOPS—TOILET ROOM GALLERY OVER CURTAIN, FARE-BOX AND FORGE ROOMS end, double-gage track between them and the paint shop building. A short section of the stub track also extends from the transfer pit into the dry kiln so that lumber may be unloaded direct from the car upon the racks in this building. Two storage tracks in addition to a side track are supplied in the east run-around aisle beside the carpenter shop building so that cars may be stored without blocking run-around. In the west run-around aisle beside the repair shop, and situated so that material may readily be handled from the run-around track, are the oil and waste house and the scrap and fuel bins.

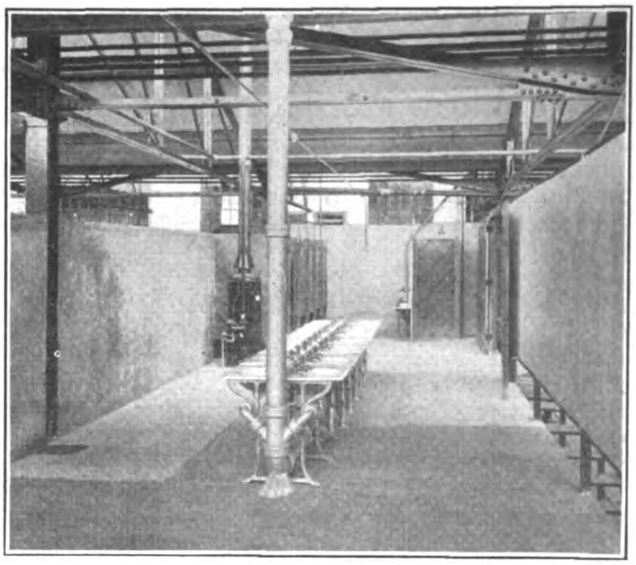
BUILDING CONSTRUCTION DETAILS

One of the most interesting features in connection with the construction of these shop buildings, as well as one which lends itself readily to construction economy, was the adoption of sawtooth roof construction for all buildings, accompanied by a standard longitudinal and transverse spacing of columns. As shown in the accompanying cross-section, the standard longitudinal column spacing is 29 ft. 5 in. The transverse spacing is 32 ft. By adopting this design and using it throughout the three structures it was possible not only to reduce design cost, but to simplify fabrication and erection to a point where the cost of the completed buildings was materially reduced. The only exception to this standard bay construction was made necessary in the two transverse panels adjoining the repair shop floor, at the inside ends of the repair and inspection pits. This alteration was made to provide additional strength in the columns to carry a 29-ft., 10-ton bridge crane.

Other standards adopted in the design of these buildings to reduce the purchase cost of materials as well as the cost of erection were the United steel sash, used in the sawtooth roof skylight construction, and a standard size of window frame and sash for use in all three buildings. The skylights were arranged with a continuous operating mechanism to provide ventilation, and each of the lower window sashes was equipped with a pivoted panel and adjustable brackets for ventilation. In addition to these, all track entrances are fitted with 10-ft. 6 in. x 16-ft. Wilson corrugated rolling doors arranged with chains and sprockets for hand operation.



LOUISVILLE SHOPS—INTERIOR OF REPAIR SHOP, SHOWING REAR REPAIR PITS, MERCURY-VAPOR LIGHTING, ETC.



LOUISVILLE SHOPS—INTERIOR VIEW OF TOILET AND BATHROOM

Other construction details somewhat unusual in character include the manner of providing partitions around the storeroom which occupies a portion of the repair shop floor, as well as the rooms in the carpenter shop and paint shop. As mentioned heretofore, these take the form of a 13-in. brick partition wall 8 to 15 ft. in height, and are intended only to serve as a barrier between these rooms and the rest of the building. It was believed that it was unnecessary to carry them higher, and besides it would have added to the construction expense without increasing economy in shop operation. All floors with the exception of those over that portion of the repair shop building set aside for blacksmith shop, are of concrete finished with a toughened wearing surface, made so by using "Ferrofax." This toughener is a combination of iron dust with cement, and it is believed that it will appreciably increase the life of the shop floors.

The roof covering is quite unusual, it being composed of a 2-in. continuous slab reinforced with "Hy-rib," a trade name for a trussed, expanded metal. The use of this material permitted the construction of the roof slab without forms, as the reinforcement was stiff enough to permit the concrete to be placed on top without sagging. After this was troweled and set, it was plastered underneath to form the ceiling. This slab is covered in turn by a two-ply asbestos, saturated composition roofing.

REPAIR AND INSPECTION PITS

As shown on the plan, the repair and inspection pits in the repair shop are of a uniform length, being 60 ft. over all, and 5 ft. 6 in. in depth. The track rails are 9-in. 90-lb. tram rails on I-beam pedestals which also serve to carry the I-beams supporting the reinforced-concrete floors. These pit rails are attached to the floor beams by the usual bolts and rail clips. The reinforced concrete floors are 6 in. thick and those carried on earth foundations are 5 in. thick.

One set of pits, namely, those at the track entrance from Garland Avenue, will be fitted with pit car hoists, arranged for individual motor drive with gear and continuous shaft connections. Those pits at the rear of the building were equipped with similar hoists, but of an older design, operated by a continuous shaft extending along the ends of all pits, each pit being fitted with chain and sprocket connections which are controlled by hand levers and clutches. These latter pit hoists were taken from the old shops. Several of the pits are built with removable rail sections at the ends nearest the repair shop floor, so that wheel renewals may be made without the use of a pit hoist. Cross-sections of these pits are shown in the illustrations.

STOREROOM ARRANGEMENT

Another construction feature of interest included in these shops was the arrangement of the storeroom. As mentioned elsewhere in this article, this is 79 ft. x 87 ft. in plan and separated from the repair shop by a 15-ft. brick partition wall. The storeroom proper is designed with 8-ft. balconies on the four sides, two of which will serve as additional storeroom space, one for the master mechanic's office and the shop drafting rooms, and the fourth is partially occupied by the employees' shower bath and clothes locker rooms. The partitions on this balcony floor are built of the Trussed Concrete Steel Company's 26-gage "Hy-rib" plastered with concrete on both sides. This type of partition was employed to obtain one of minimum thickness and at the same time of substantial construction. All the partitions around the toilet, locker and washing rooms have their bases elevated about 18 in. above the floor level so that the foreman on the shop floor may observe loiterers. This balcony is reached from the repair shop by an ornamental stairway.

A basement below the storeroom floor is used to store such rough, heavy material as is drawn out of the storeroom at infrequent intervals. Both the basement and balcony are served by an electric freight elevator. All shelving and bins used in the storeroom are of the adjustable metal type, thus conforming to the fireproof construction of the building and giving the maximum storage space per square-foot area occupied by bins and shelving. A wide door opening to the east run-

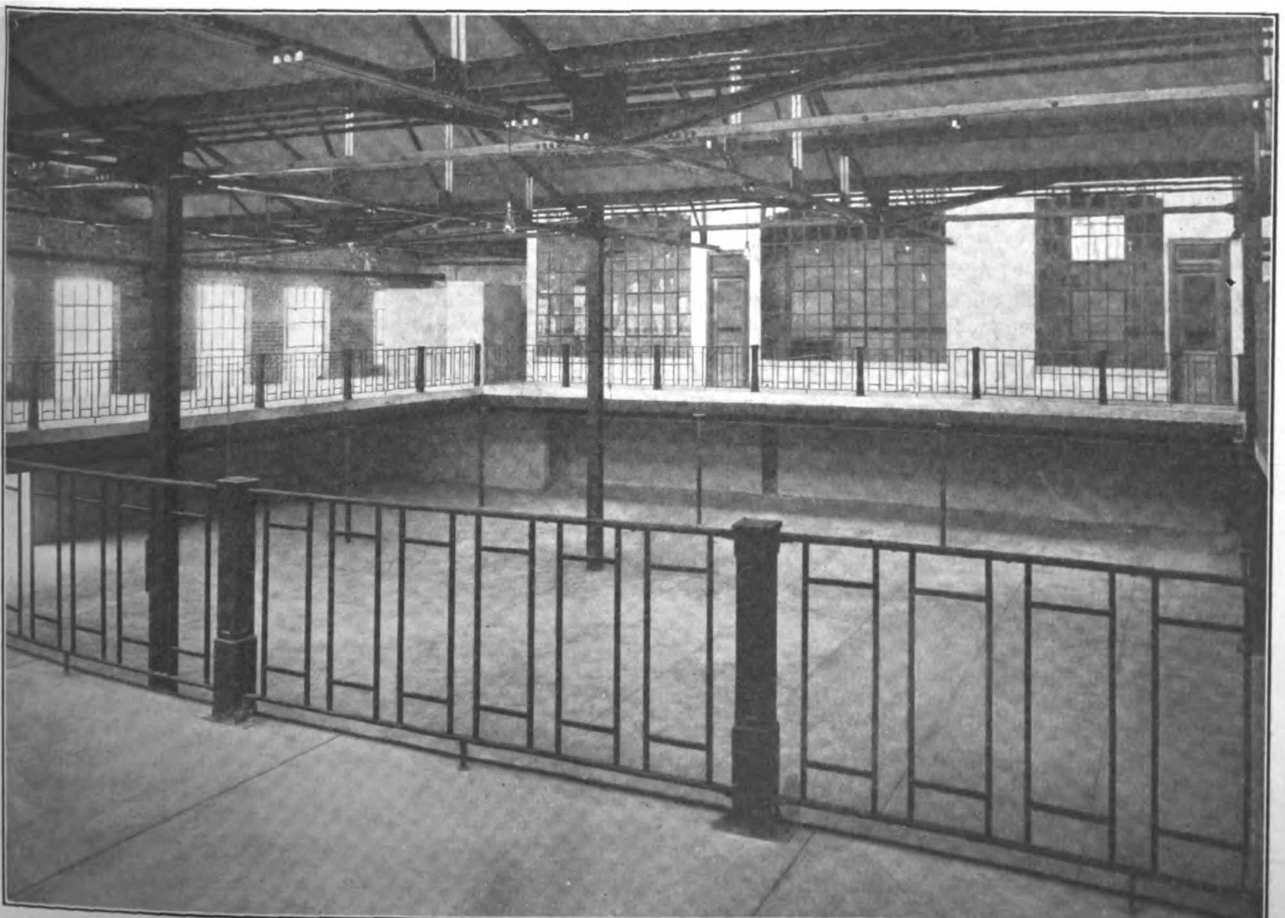
around track aisle leads to an unloading platform so that material may be handled direct from the car to the storeroom.

The use of a narrow-gage industrial railway in the repair shop of a railway is somewhat uncommon, but it is believed that this railway will aid materially in handling heavy repair parts from the pit areas either side of the floor to the several repair departments and the storeroom. This industrial railway extends along the ends of the repair and inspection pits, and serves as an auxiliary to the two bridge cranes. It is equipped with flush turntables at the intersections of the industrial railway and the through track immediately in front of the storeroom. Those machine tools used in work on the heavy repair parts were installed, of course, convenient to the industrial railway tracks.

Heating System

The heating plant in one corner of the carpenter shop has two Henry Vogt boilers of 150 hp. each and a 150-ft. self-supporting, unlined steel stack. Concrete coal bins, under one of the storage tracks beside the boiler room, were provided for heating-plant fuel storage. The space over the heating plant, which is in a depressed room below the shop-floor level and inclosed in brick walls, serves as a storeroom for miscellaneous material. All heating coils are of the built-up type, vacuum return, arranged on racks on the building walls and on the lower



LOUISVILLE SHOPS—VIEW OF STOREROOM AND OFFICE BEFORE USE, WITH FLOOR LEVEL ENTRANCE AT LEFT cords of the sawtooth roof trusses. Heat also is provided in the pits in the repair and carpenter shops, the pipe being set in recesses in the concrete walls or arranged on coil racks under the shop floor in the space adjoining each pit. In addition to the coils for general heating in the paint shop, four pipe coils have been installed in a shallow open duct along the center line of each track. These were included to expedite paint drying, and are arranged in sections with individual control.

ELECTRIC WIRING AND ILLUMINATION

For general shop illumination in the repair and carpenter shops, 550-volt, 385-watt, 300-cp single and double-tube Cooper-Hewitt mercury arc lamps were used and spaced at frequent intervals. These were supplemented by tungsten lamps on drop coils, where individual light was desired as well as in the bath rooms and offices. Paint shop illumination was supplied by tungsten lamps on drop cords. It was believed that direct lighting would be more satisfactory in this shop. All wiring to the general illumination fixtures is exposed and carried on porcelain insulators attached to the overhead steel work. In possibly hazardous places this wiring was run in metal conduit. Overhead trolley wire was provided over the pits in the machine shop, in the carpenter shop and paint shop. The usual rolling door clip with the trolley dead-ended each side of the building wall at the entrance was furnished. Inside the buildings the trolley wire was carried in wooden trolley trough bolted to the lower cords of the transverse building trusses.

TRANSFER TABLES

The grouping of the three shop buildings necessitated the use of transfer tables between them to facilitate progressive shop movements. In order to reduce the aisle width to a minimum and to eliminate the old style deep pits, a shallow floor type table was purchased from George P. Nichols & Brother. The flush type of table would have required the use of track aprons, consequently wider aisles between the pits and the face of the buildings. The use of aprons also was prohibited by the low car fenders. The apron was eliminated by dropping the pit level 9½ in. below the top of the shop track rails.

These two shallow floor transfer tables are 46 ft. long and were designed to carry a 35-ton loaded freight car. In order to accommodate steam-railroad equipment it was necessary to place a double running rail on one side of the table. The supporting girders are 11 ft. 3 in. center to center, giving a clear width of 9 ft. 6 in. The elimination of the aprons made it possible to place the stirrups carrying the table wheel bearings at the end of the girders and the first floor beam 6 ft. 1½ in. in from their ends. The diameter of the wheels and the location of the bearing allows 1¼-in. clearance between the shallow floor and the top of the pit rail. The table is self-propelled by a 15-hp motor supplied with energy from the 550-volt trolleys which parallel the pit.

These new shops represent an expenditure of approximately $250,000, which is quite low for the cubic foot building content of fireproof shop construction. They were designed by J. B. Hutchings and E. T. Hutchings, architects of Louisville, under the direction of T. H. Minary, assistant general manager, and John Zoll, master mechanic Louisville Railway. The construction work was done under contract by the L. W. Hancock Company, Louisville.

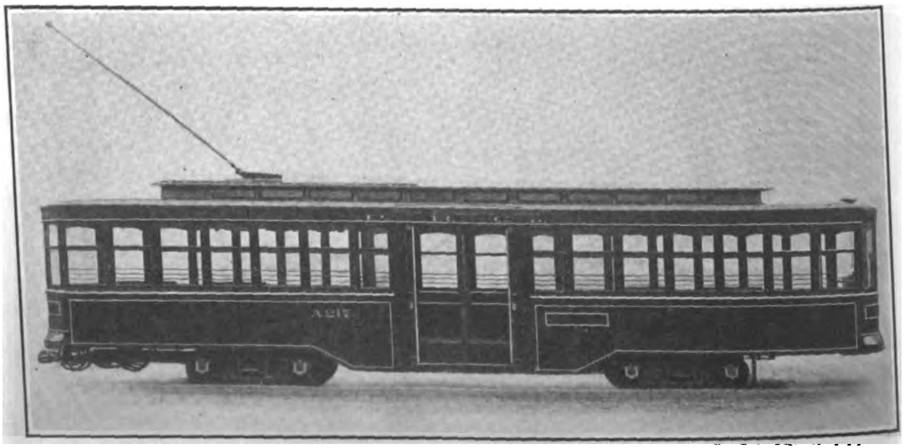
Interurban Cars With 26-In. Wheels for Pittsburgh

The Pittsburgh Railways Company, which originated the "low-floor" car with 24-in. wheels, is now planning the extension of the use of small wheels to its interurban service. Quotations have been asked for ten interurban cars with 26-in. wheels. Four 50-60-hp motors will be used, and to these will be applied the same principles of design that were so successful with the original 30-hp "baby" motor design. The new cars, of which a floor plan is shown in the accompanying line cut, are to be 52 ft. 8 in. long, and they are estimated to weigh complete 45,000 lb. A large part of the great reduction in weight is obtained through the use of the small wheels, motors and trucks.

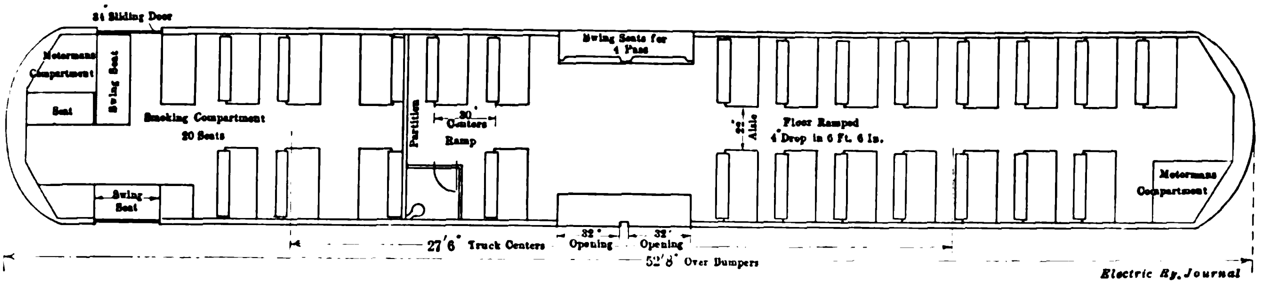
The decision to build cars with such a radical innovation as the small wheel for high speed was only made after extended tests had been carried on with a small-wheel car in interurban service. This test car, shown in the accompanying half-tone, was one of the original "low-floor" cars developed by P. N. Jones for city service in Pittsburgh. The wheels, however, were specially made to be suitable for interurban work, and the gearing was changed from the high ratio of 15:58, as regularly used, to a ratio of 23:50, so that the car could make the high speed required by the run.

A number of extended tests were made with this car upon the Charleroi and Washington lines out of Pittsburgh. In all cases the car was able to operate on a schedule easily equal to that of the standard interurban cars, making all stops and operating satisfactorily on all grades. In one case a test run was made down a grade of 1½ per cent, and 2 miles were covered in two minutes twenty-two seconds, a speed of 51 m.p.h. No nosing of the car was found to exist, and it is reported that the riding qualities of the car even at this high speed were equal to those of the heaviest interurbans. Following the experiments the test car was placed in regular interurban service between Cannonsburg and Washington, and it is still giving perfect satisfaction.

The cars now in service on the interurban lines of the Pittsburgh Railways weigh from 33 tons to 37 tons and are equipped with four 100-hp motors. The regular run on the Washington line is 30 miles and it is made in one hour and fifty minutes. The run to Charleroi is 34.6 miles long and this is made in two hours and fifteen minutes. The first 7 miles of both runs take thirty-three minutes, as this distance is run in city or



PITTSBURGH SMALL-WHEEL INTERURBAN CAR—TEST CAR WITH 24-IN. WHEELS THAT WAS OPERATED AT 50 M.P.H.



PITTSBURGH SMALL-WHEEL, INTERURBAN CAR—PROPOSED FLOOR PLAN

suburban streets, and much of the time is consumed in passing through some long narrow towns.

The result of the use of a light car with small wheels and motors is graphically shown in the accompanying diagram, which indicates the values of the current in amperes and the speed in miles per hour for various tractive efforts at the motors. The tractive efforts of the different motors used on the test car and on the regular interurban car are prorated in accordance with the weights of the two cars so that the speed and current consumption curves fall within the same range for the large motor and for the small one. As shown by the diagram, two gear ratios were tried for the small motor. One of these, namely 26:47, was not used in the actual tests, the gear ratio of 23:50 being considered to be more generally desirable.

The curves of current consumption show graphically the marked difference between the small and the large motors, most of this being due, of course, to the great decrease in weight. In addition, it was found that when starting the small car with all motors in series the draft of current was about one-fourth of what it was when starting the large car with motors in pairs, two in series. The worst grade on either one of the lines is 6 per cent, and on this the present interurban cars usually require about 500 amp. However, it was found that the small car took but 220 amp.

It will be noticed from the half-tone that the test car has very short truck centers, the trucks being only 21 ft. 6 in. apart. On the new cars, however, this dimension will be increased to 27 ft. 6 in. It was found during the tests that the short truck centers on the test car had no very great influence on the riding qualities of the car, but the increased length is undoubtedly safer. The wheels on the test car were 24 in. in diameter with a 7/8-in. flange and a 2 7/8-in. tread. On the new cars, however, the wheel diameter will be increased to 26 in. to accommodate the larger motors.

The Interest of the Banker in State Regulation*

Numerous functions of the Pennsylvania Public Service Commission are of interest to bankers, especially the functions in connection with rates, values and the financing of public utilities. The state and its municipalities grant rights, and the public is entitled to a supervision which will prevent improper use of such powers, and insure adequate service and reasonable charges therefor. On the other hand, the companies have their right to fair treatment so that they shall be able to give the service that is required of them, and also be assured the return to which those who have invested in their securities are entitled.

A great difficulty in arriving at this proper fairness in regulation is that the public service companies are not starting afresh, simultaneously with these new regulating bodies. It would seem simple enough for a commission to fix proper rates; and, in the case of a new company, satisfied that rates will be maintained sufficient to provide for a fair return from the outset, investors might be entirely willing to put their money into the enterprise. But regulation enters the field when public service corporations are in full swing. Their stocks and bonds have been issued and outstanding for years—sometimes too generously issued perhaps but generally in accordance with law as it existed prior to the limitations of to-day. Many of these enterprises were financed on bonds issued at a discount with a bonus of stock thrown in. On the one hand there are utility companies so floated asking commissions to fix rates to provide a return on the face value of all those securities; on the other, some commissions are disposed to restrict the rates to a bare return on the actual cost of the physical plant. Something fair between these extremes must be determined. Certainly the old method of financing was necessary to some extent. Within certain limits it was legal, and even if the speculative element which seemed essential to make the proposition attractive in the past is now cut out, the readjustment should not be done in such a way as to put necessary and efficient utilities into bankruptcy.

It has been feared that state regulation may tend to drive away enterprise and capital through the possible cutting out of any capital expenditures for the compensation of promoters, through not allowing for expenses or losses in the development of the business and through failure sufficiently to make provision for the cost of money, all of which are expenditures quite as necessary in the establishment and conduct of such a business as the purchase of poles, wires, pipes, tracks and ties. It cannot be expected that men will give their time, brains, abilities and efforts to promote an enterprise, procure the money for it and through preliminary years have no return or only a small return on the cash invested, without compensation. Such initial services are as proper a charge against capital as services in obtaining the charter. Such continued services are as much entitled to remuneration as those of the lawyer in preparing by-laws and certificates for full paid common stock, mortgages, merger agreements, or in applying for ultimate receiverships.

---

*Abstract of address by Parker S. Williams, Philadelphia, Pa., at convention of Pennsylvania Bankers' Association, Bedford Springs, Pa., June 27, 1914.

A witness at a certain commission hearing, familiar for years with utilities and their financing, expressed his opinion in effect as follows:

"Government regulation involving the matter of the fixation of maximum return eliminates the speculative element of value. The immediate effect is to make it more difficult to raise money. With proper regulation companies can raise money more cheaply. A fair return is the return that will be necessary to attract money into the enterprise whenever it is needed and in the amounts needed, in order to take care of the development of the business, that being the lowest return possible. Regulation in the end, when the companies know how to deal with it and the commissions know how to deal with it, when both sides know what is required and what has got to be done, unquestionably is going to make it possible for the companies to raise money on a better basis. Speculative value is not necessary for the future. Regulation is preferable to speculative conditions, assuming that regulation is worked out and that it takes into account all the elements of value and all the questions that enter into the operation of the utilities."

It is to the interest of every banker to do all in his power to establish a fair basis of regulation. If it discloses a disease, regulation cannot be charged with causing it. If some over-capitalized corporations have to go through reorganizations, if some soundly established corporations have to suffer from temporary uncertainty if from nothing more, the outcome may be hoped to be generally beneficial. The banker cannot dodge his responsibilities to help make it so. We are not ready for state or municipal operation of many of our public utilities. Facts and experience as to the character of service and the cheapness of service by private operation compare too favorably with the results of management capable of being affected by politics.

In such legislation as that dealing with the regulation of public utilities, all good citizens, and in the van the bankers, must take a hand. Every proper effort should be made to make certain of retaining well qualified men as commissioners. The commission should be supported with respect such as is accorded to the bench. Whenever a matter of rate making or valuation affecting a utility in which bankers are interested directly, or only as they represent financial interests in a community they wish to see progress, let them make sure that every consideration which should have weight in the matter of fairness is presented to the commission.

Practically all of the principal jewelers in Louisville, Ky., are equipped to demagnetize the watches of the trainmen on the Louisville street railway and the various interurban railways which run into Louisville. One of the jewelers has distributed leather billfolds and controller handle pads to the trainmen to secure their business.

Suburban Fares at Boston

Although it is well known that, in general, electric railway fares are less than those charged by competing steam railroads in suburban districts, the extent of the differences in favor of the former in a given metropolitan area is sometimes very striking. In the recently published report of the Massachusetts Public Service Commission and Boston Transit Commission upon transit conditions at Boston, an appendix of much interest is devoted to a comparison of steam and street railway fares between Boston and sixty-eight stations in the suburban district lying from 3 to 12 miles away from the heart of the city. All of these stations are on the lines of the Bay State Street Railway, and many are reached by the cars of the Boston Elevated Railway Company. Either the Boston & Maine Railroad or the New York, New Haven & Hartford Railroad provides the steam service to and from these points.

Of the sixty-eight stations listed, street railway fares are lower than the single ticket steam railroad charge in sixty-four instances. Forty-three stations are accessible by trolley at a 5-cent fare from Boston, this rate applying to a maximum distance of 9 miles from the steam railroad terminal. Twenty-five stations are reached by trolley at a 10-cent fare. The maximum distance available on the steam systems for a straight 5-cent ticket is 4 miles. A detailed comparison with existing single ticket fares shows that the transient patron of the local transportation facilities will in general be carried from 150 to 200 per cent as far for a given expenditure on the trolley lines as for the same outlay in steam railroad fares. The commission report does not include any data bearing upon the single trip ticket charge, but the foregoing points have been brought out by independent analysis.

The bulk of the traffic in the Boston suburban district naturally moves upon the basis of commutation rates, and the commission's tabulation of these in comparison with the corresponding trolley fares affords interesting deductions. Considering the one-way commutation rate upon the twelve-ride ticket available at each of the sixty-eight stations listed in the report, one finds that the electric railway fares are lower in forty-two cases; that in no instance is the trip charge less than 5 cents on the steam road and in thirty-four cases it exceeds 5 cents. Fifty-one stations are accessible on the steam lines at commutation rates on the twelve-ride basis at single trip charges running between 5 and 10 cents, but of the entire list of stations only ten are accessible on single-ride tickets at less than 10 cents by steam.

The maximum distance reached by a 10-cent electric railway fare is 12 miles, so far as the suburban list goes, while the maximum distance reached by a straight 10-cent fare on the steam lines is 9 miles.

Examining the relations between fares and distance it is interesting to note that up to and including 5 miles, the electric railway fares are invariably 5 cents; the steam railroad single trip tickets range from 5 to 10 cents, and the commutation rate on the twelve-ride basis runs from 5 to 7½ cents. Stations 6 to 9 miles out, inclusive, are reached by trolley at fares of from 5 to 10 cents, by single steam railroad tickets of from 11 to 17 cents, and by commutation rates of from 7½ to 9.58 cents.

There is always a terminal charge, of course, associated with the steam traffic, whether directly recognized or not. It is interesting to note, also that if a 6-cent fare should take the place of the present 5-cent charges on the electric railway lines to and from these stations on the north and south sides of Boston listed in the report, in thirty-four cases the commutation rates would still be higher.

Welfare Work of the Public Service Corporation of New Jersey

The Public Service Corporation of New Jersey has just issued the third annual report of the welfare committee. The employees of the company are protected by four types of insurance: health, life, old age and accident. The first three kinds are embraced in the company's welfare plan, which was inaugurated Jan. 1, 1911, and which is distinctive in that the corporation assumes the entire cost. Accident insurance is provided under the state employers' liability act, which became effective July 4, 1911. The elective compensation feature, which the Public Service Corporation accepted, is operated in conjunction with its own welfare plan, thereby increasing the scope of the act.

Under these insurance plans the employees, their relatives or their dependents have received during the year 1913, through the welfare committee, $104,282.50, of which $56,424.76 was paid for disability due to illness and for death therefrom, and for superannuation. The remaining $47,857.74 was paid for injury and death from accidents arising out of and in the course of employment. During the last three years the employees, their relatives or their dependents have received $248,945.01, of which $157,548.33 was paid for insurance, sick benefits and pensions and the remainder for accidents arising under the workmen's compensation act and for death therefrom.

TABLE I.—Showing Details of Cases Handled

Year	Welfare Applications and Accident Reports Received	Cases Investigated: Number	Cases Investigated: Per Cent to Cases Received	Cases Payments Begun: Number	Cases Payments Begun: Per Cent to Cases Received	Cases Payments Begun: Per Cent to Cases Investigated	Calls Made Upon Employees
1913 ...	4608	3629	79	2208	48	61	6410
1912 ...	4235	3809	90	2076	49	55	*7161
1911 ...	....	....	..	1405	..	..	....

*Estimated upon records kept for nine months.

Upon the basis of the number of employees in service Dec. 31, 1913, the cost of the welfare plan and accidents for the year 1913, including operating expenses, averaged $9.17 per man, and for three years, $7.16. Thus, during the past three years, the employees of the Public Service Corporation have been provided with health insurance of $1 per day, life insurance of $300 and old-age pensions. Furthermore, they have been protected by accident insurance, giving, in general, half wages during disability and provision for dependence for a period of six years in case of death.

Table I shows the number of cases investigated and other details of handling cases for the last three years.

The Public Service Railway, with approximately one-half of the employees of the Public Service Corporation, expended in welfare work $42,662.26 during 1913. Of this $10,972.30 went for insurance, $20,632.08 for sick benefits, $7,571.24 for pensions and $3,486.64 for administrative expenses. The death rate shows a record of decreases during the last three years as follows: for 1911, 6.18 per thousand; for 1912, 5.96, and for 1913, 5.10. More than 60 per cent of the mortality resulted from four causes as follows: Pneumonia, 22 per cent; tuberculosis, 10 per cent; heart trouble, 15 per cent, and Bright's disease, 11 per cent. The rate of illness per hundred employees for 1911 was 10.46; for 1912, 10.31, and for 1913, 11.35. The accompanying diagram shows the occupational tendency toward disease among the various employees. The most common diseases are influenza, rheumatism and gout, acute and chronic bronchitis, and ordinary diseases of the stomach. Those most frequently affecting trainmen are influenza, rheumatism, bronchitis, quinsy, tonsilitis and diseases of the stomach. The welfare committee continued its policy of prevention during 1913 by issuing several bulletins upon hygiene, sanitation and the prevention of disease.

There were fifty-three pensions in force during the year among all the employees of the Public Service Corporation, and the average amount paid upon each was $278.12, the total cost being $14,740.12. The minimum pension rate is $240 per year. During 1913 the Public Service Railway paid 51.36 per cent of the cost of service annuities.

There were 3070 reports of accidents to employees received during the year, upon 878 of which, or about 28 per cent, some compensation was paid to the employee or a series of payments begun. The total cost of accidents, as shown by Table II, was $56,418.98 during 1913. This was an increase of $12,717.08 over the year 1912, made up as follows: Compensation paid to employees or their dependents, an increase of $8,015.27; medical service, etc., rendered to employees, together with funeral expenses and court costs, an increase of $3,061.12; other expenses, an increase of $1,640.69. Of the $32,457.48, the total compensation paid, $8,322.63 applied to thirty-three cases upon which payments continued from 1911 and 1912 into or through 1913. Of these thirty-three cases, seven were the outcome of fatal accidents requiring compensation for 300 weeks, and sixteen were cases of permanent injury resulting in payments for many weeks, the amounts involved during the year being $2,305.19 and $5,450.34, respectively.

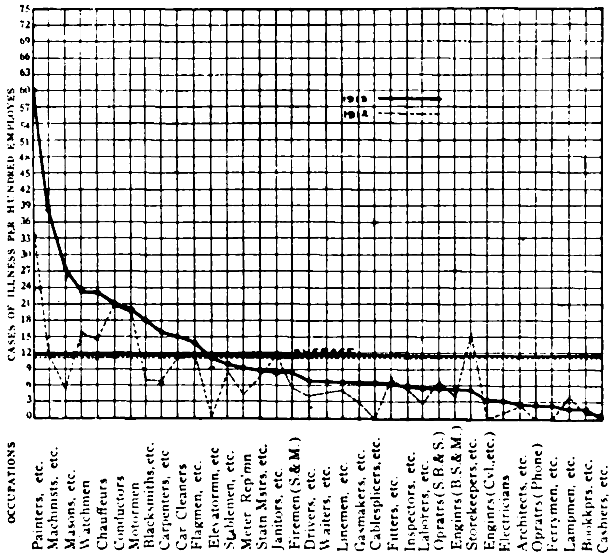

DIAGRAM SHOWING OCCUPATIONAL TENDENCY TOWARD DISEASE AMONG EMPLOYEES

TABLE II.—Total Cost of Accidents†

Company and Year	Total	Compensation on Account of Employees	Medical and Hospital Services, Funeral Expenses and Court Costs on Account of Employees	Other Expenses
All companies, 1913..	$56,418.98	$32,457.48	$15,400.26	$8,561.24
Electric company....	19,057.04	11,795.87	4,480.35	2,780.82
Gas company........	12,507.96	6,133.10	3,663.86	2,711.00
Railway company....	24,848.98	14,528.51	7,251.05	3,069.42
Corporation	5.00	.00	5.00	.00
All companies, 1912..	43,701.90	24,442.21	12,339.14	6,920.55
All companies, 1911..	*9,051.94	*5,211.22	*1,546.37	*2,294.35
Three years.........	109,172.82	62,110.91	29,285.77	17,776.14

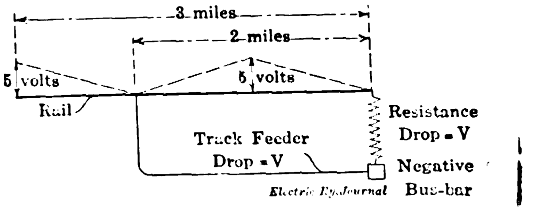
*Six months only in 1911.
†Includes payments begun this year and those carried over from former years.

It is interesting to note that of the $47,857.74 paid during 1913 for accidents, $37,300.22 was paid under compensation law requirements, while $10,557.52 was added under the corporation's welfare plan in accordance with its general policy of caring for its employees. This was 28.3 per cent beyond the legal requirement. Similar payments made during the last three years amounted to 18.59 per cent.

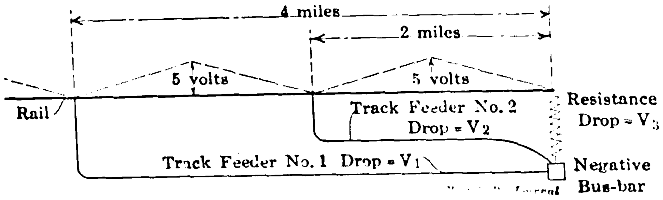
Rail Feeders for Tramways

In the *London Electrician* for July 17 Henry M. Sayers contributes an article based upon that of Messrs. Rosa and McCullom, printed in the ELECTRIC RAILWAY JOURNAL for Jan. 3, 1914, page 37. Mr. Sayers argued for a further consideration of boosted insulated return feeders and by a calculation showed that they may be cheaper in some cases than the "regulated" feeders advocated by Messrs. Rosa and McCullom. He stated that the booster plan lends itself readily to calculation and to the use of feeders of the most economical sizes, as determined by the application of Kelvin's law.

In applying this law to the regulated feeder Mr. Sayers showed that when a feeder is tapped into the rails at some point as indicated in the first figure and the rails at the station are connected to the negative busbar through resistance, the most economical size of feeder is that in which the interest charge on the cost of the cable equals the annual cost of energy lost in the feeder and in the resistance.



RETURN FEEDERS—SINGLE FEEDER ARRANGEMENT



RETURN FEEDERS—TWO-FEEDER LAYOUT

When two feeders are connected as shown in the second figure the cost of copper for any drop, V, is proportional to $[(I_1 \times l^2_1) + (I_2 \times l_2^2)] \div V$, where I_1 and I_2 are the currents in feeders 1 and 2 respectively, and l_1 and l_2 are the respective lengths of these feeders. The cost of wasted energy is proportional to $V\ (I_1 + I_2 + I_r)$, where I_r is the current in the resistance connection.

These two costs are equal for the minimum total cost. Hence

$$A\left(\frac{I_1 \times l_1^2 + I_2 \times l_2^2}{V}\right) = B\ (I_1 + I_2 \div I_r)\ V,$$

where A and B are numerical or "value" constants. From these equations,

$$V = \sqrt{\frac{A\ (I_1 \times l_1^2 + I_2 \times l_2^2)}{B\ (I_1 + I_2 + I_r)}},$$

the most economical voltage drop for this case. In applying the formula, values for cost of copper, annual charges and cost of electrical energy are assumed and the magnitudes of the currents are estimated from a diagram of the system.

In estimating the corresponding costs of boosted feeders, Mr. Sayers allows for the losses in the boosters and for the costs of the boosters which, he states, are very cheap machines. The boosted energy may cost per unit about 40 per cent more than unboosted energy. Even with these extra losses he finds that in an assumed case the booster plan may be cheaper than the regulated feeder plan if the boosted energy does not cost too much. The booster feeders also have certain operating advantages, namely: they can be made to automatically provide for voltage drop with increase of load and can be readily adjusted to meet the requirements of varying traffic conditions; they make unnecessary the use of more copper than considerations of economy dictate; they keep the line voltage drop down to the rail drop, i.e., not more than seven volts if the Board of Trade regulations be met. Mr. Sayers' general conclusion is that in every case where track feeders are necessary there is a choice of systems making it worth while to calculate closely the relative costs.

Minority Report on the Crosser Bill

The minority report on the Crosser Bill providing for municipal ownership of street railways in the District of Columbia was filed this week. It is signed by Representatives Winslow, Reed, Walton, Keister, Prouty, Caraway and Johnson.

Representatives Prouty and Caraway added a postscript to the report in which they declared themselves in favor of municipal ownership "where local conditions make it practicable." They consider, however, that in Washington "it is unfair to the inhabitants of the District of Columbia to have so large an indebtedness imposed upon them by the Federal government without their consent or expressed wish."

The report criticises both the principle and the details of the bill. In speaking of the latter, it says that while the bill provides for the purchase of the existing roads by condemnation, nothing is said in the bill about the way in which the value of the roads is to be obtained, an omission which clearly indicates general carelessness and complete lack of business acumen on the part of the framers of the bill. It also says that no data were presented to the committee as to the probable amount of the award. The District Commissioners are also criticised for their "blind enthusiasm in advocating the general principles of municipal ownership" as well as their "gross carelessness in studying the structure of the bill." The committee believes the House of Representatives is entitled to more efficient service.

Meeting of Public Service Association of Virginia

A meeting of the Public Service Association of Virginia, which is composed of the principal street railway, electric light, gas and water companies throughout the State, was held at the Chamberlin Hotel, Old Point, Va., on Aug. 4. Matters of interest to the association were discussed and the usual routine business disposed of. The officers elected for the ensuing year are as follows: President, J. W. Hancock, of the Roanoke Railway & Electric Company; first vice-president, J. F. Rison of the Danville Traction Company; second vice-president, B. B. Fergerson, of the Portsmouth Gas Company; third vice-president, J. N. Shannahan of the Newport News & Hampton Railway, Gas & Electric Company; secretary and treasurer, W. J. Kehl, of the Virginia Railway & Power Company.

The Congress of Costa Rica has provided for the construction of a tramway between Alajuela and San Ramon, Costa Rica.

COMMUNICATIONS

The Kansas City Franchise

KANSAS CITY, MO., July 30, 1914.

To the Editors:

There appeared in your issue of July 18 a communication signed by Delos F. Wilcox, containing several criticisms of the franchise, as adopted in Kansas City on July 7.

Mr. Wilcox was engaged to come to Kansas City during the campaign preceding the election by the local newspaper opposing the franchise. He wrote several lengthy communications attacking the agreement, and these established only one fact—that he did not understand the document. This is made evident by taking up in detail the eight objections set out in his communication to you. These are, in their order, as follows:

1. The recognized value is too large.
2. The forfeiture clause is a joke.
3. The extensions are inadequate.
4. The system of dual control is without precedent and inefficient.
5. The franchise violates the fundamental rules of law, accounting and morality, by making personal injury claims subordinate to the company's returns.
6. The franchise provides for the inflation of the capital account.
7. The franchise holds out the false promise of municipal ownership.
8. The city was not in a position to effect a favorable settlement.

Of these in detail:

1. In regard to the valuation. There were a number of valuations made of the property of the Metropolitan Street Railway System by different individuals. Mr. Wilcox was not included.

Bion J. Arnold valued the property for the Federal Court on the basis adopted in the valuation of the Chicago traction properties and found it to be approximately $35,026,000. Mr. Arnold also valued the property on a basis adopted by the Wisconsin Commission in the Antigo Water case and, allowing a 6 per cent return, found it to be on this premise, $35,044,000. He also made a thorough audit of the company's records, which were found to be unusually complete. This established the fact that there had been invested in this system the sum of $34,200,000 in cash, on which the average return had been slightly over 5 per cent.

L. R. Ash, then city engineer of Kansas City, Mo., valued the property for the city, and found it to be worth $32,000,000.

Mr. Moxey, a well-known government accountant, on behalf of the city, audited the books of the company and reported that the investment in the property was approximately $37,000,000.

The value written into the contract for the whole properties is $30,000,000. This is $2,000,000 less than the minimum value fixed by the city's own appraiser; $7,000,000 less than the maximum value fixed by the city's accountant, and $4,000,000 less than the minimum value found by Mr. Arnold on either of these premises. These are the findings of the only men who investigated the value of the property, and Mr. Wilcox must admit that he is in no position to criticise their findings, as he had never made even a casual inspection of the properties under discussion.

Mr. Wilcox states that the $30,000,000 valuation at 6 per cent is equivalent to a $36,000,000 valuation at 5 per cent, as allowed in Chicago. This is untrue, and certainly the statement would never be made in good faith by anyone familiar with the provisions of the Chicago and Kansas City ordinances. In Chicago, in addition to the 5 per cent return on the capital value, the company is allowed 5 per cent for financing and 10 per cent for contractor's profit, so that for every $100 added in property, $115 is added to the capital account of the company. In the new Kansas City franchise nothing is allowed as contractor's profit, nor is one penny allowed for the exchange of $28,700,000 of securities. In addition, in Chicago the company participates immediately to the extent of 45 per cent of the net earnings, after payment of fixed charges, whereas in Kansas City the participation is deferred for a period of seven or eight years, and then only to the extent of 33 1/3 per cent of the net. The company would have much preferred a contract similar to that granted in Chicago—that is, allowing it a higher valuation at a lesser fixed return and immediate participation, together with the 15 per cent allowance above noted. This proposal was rejected by the city, and a five-minute calculation will show that the basis of settlement embodied in the new ordinance is much more advantageous to the city than the Chicago settlement.

Further, the cost of a loan is very closely proportional to the equities covered by the mortgage, a point which Mr. Wilcox altogether overlooked. This company could most assuredly borrow $30,000,000 at a lower rate had a valuation of $36,000,000 been placed on the property, than it can borrow $30,000,000, but with the $30,000,000 valuation so fixed.

2. In regard to the forfeiture clause. The forfeiture clause contained in the ordinance is taken from an ordinance granted to the Kansas City Terminal Company in 1908-1909, which ordinance is referred to by Mr. Wilcox in his book on "Municipal Franchise" as a "most comprehensive and carefully drawn document." The forfeiture clause under criticism is a model. Its purpose and effect is not to forfeit or destroy property but to insure compliance with the contract. It provides that if the grantee violates the contract, then the city shall take possession and operate the property consistent with the contract and correct the delinquency. It is hardly likely that the city would make a profit during this time, so there is little danger of the company being retired on three-quarters salary. It should not be the purpose of a forfeiture clause to confiscate a property but to insure that the contract will be complied with at all times.

The only honest purpose that should be had in mind with respect to this character of clauses is not that the city should make money or acquire property by virtue or violation of contract, but that it should be in a position that it may, by virtue thereof, insure that the contract will at all times be complied with on the part of the grantee.

Notwithstanding the suggestion of Mr. Wilcox that this clause is a "joke," it is confidently expected that it will be accepted as a standard in contracts hereafter entered into in other cities.

3. In regard to extensions. The new contract contains the most liberal provisions covering extensions ever embodied in a street railway franchise. There are four conditions under which extensions can or will be built:

First—The company is obligated to build between 20 and 25 miles of track within three years, and thereafter not less than 4 miles of single track per year.

Second—All additional trackage, wherever situated within the city limits, which, in the opinion of the board of control, will pay 6 per cent on the investment in addition to operating expenses may be built.

Third—Any group of citizens may construct track within the city limits, and when this track is connected with the lines of the company, the company is required to operate thereover and the track becomes the property of the city.

Fourth—The city may, by the creation of benefit districts, build any number of miles of track, assessing the cost of same against the property within the district, and the company is obligated to operate cars over such tracks.

The Kansas City system is now largely over-built, as there are more miles of track per inhabitants than in any other American city, with one possible exception. The same franchise conditions which brought about this excessive mileage have been embodied in the new contract and the three further provisions above enumerated included, so that Mr. Wilcox, by stating that the extension clause is totally inadequate, is certainly unfair and writes without regard to the facts.

4. The system of dual control objected to may or may not be inefficient. It was felt that the largest part of the duties assigned to the board of control, which consists of one representative for the city and one for the company, were of a character upon which the representatives could agree, and that there would be no necessity for the continual expense of a third member. In matters which require arbitration, the selection of an arbitrator is not cumbersome. It is provided that the Kansas City Court of Appeals, consisting of judges who reside in this community, ride on the street cars and are members of the every-day social, business and political life of the city, shall name the third member. The Kansas City Court of Appeals was decided upon for these reasons.

As to the other objections raised in this paragraph by Mr. Wilcox, a mere reading of the ordinance will disprove any claims set up by him.

5. That the franchise violates the principles of accounting with respect to the provisions of personal injury claims. This is a very curious error, to say the least, in which Mr. Wilcox has fallen and further illustrates how casually he has read the ordinance. Personal injury claims are not subordinated to the return of the company on capital account. Under "disposition of earnings" it is provided first, that there shall be paid all expenses of management and operation, and we do not need Mr. Wilcox to tell us that personal injury claims are one item of the expense of operation, as this is self-evident.

What is provided is, that all the old personal injury claims which have not been litigated and which occurred prior to June 3, 1911, are to be paid as a special operating expense. The wording of the contract is as follows: "All liabilities for personal injuries and damages to property including claims due the city *up to the time of the adoption of this contract*." In other words, all the old claims, which under no rule of accounting could be considered operating expenses of the new company, are to be paid as a special operating expense, and the company does not participate in the surplus earnings until these claims are discharged.

6. That the capital value can be inflated. The provisions as to the addition to capital are taken verbatim from the Chicago ordinance and provide that before one dollar can be added to capital account this expenditure must be authorized by the board of control; the expenditure supervised by the board of control, and the board of control in writing to certify to the city comptroller by the twentieth of each month the amount so authorized and expended during the preceding month. In addition, it is provided that an audit shall be made by independent accountants, other than those of the board or of the company, every six months, with respect to all disbursements of the company. Under such conditions how capital value can be inflated is beyond comprehension.

The difference between the present or depreciated value of the property and the value written into the contract is to be made good by extensions and additions out of the earnings and not added to capital account. The 21 per cent which Mr. Wilcox discusses, of course, never will exist in physical property but will exist in the nature of a depreciation reserve or fund, which is a possession of the property, so that when the intangible value is made good out of the earnings of the company, as provided in the contract, the depreciated value of the property, together with the renewal fund and the additions and extensions made out of earnings, but not added to capital account, will equal $30,000,000.

It is further provided in the contract that the amount of outstanding stock and bonds shall never exceed the capital value of the property. Furthermore, the issuance of all securities, bonds, stock or any other form of securities, must be approved under the laws of this state by the Public Service Commission.

Considering all the above, how is it possible to inject one dollar of water into the capitalization of this company under the proposed contract?

7. That municipal ownership is a false promise. The company agrees in the contract to sell out to the city at any time, on sixty days' notice, at an agreed value. The company is limited to a 6 per cent return, and under such conditions how it would be possible to reduce fares at the expense of the company is inconceivable. After a certain period the city participates in the earnings, and the city may use its participation for the reduction of fares, if it sees fit, or for two or three purposes enumerated in the contract.

The meat of the objection made by Mr. Wilcox is that the company has given to the city a right to buy the plant, but it has not furnished the city the money with which to effect the purchase.

8. The city was in a most advantageous position to effect a settlement. The company has been in a receivership for three years, and Judge Hook stated that the receivership could not, in justice, be longer continued. The company has outstanding $28,700,000 of funded obligations, in addition to approximately $6,000,000 of stock. Of the funded obligations $22,000,000 are past due, and the creditors long since petitioned for a foreclosure under their respective mortgages, and testimony has been taken in regard to such foreclosures.

The company in the new contract has agreed to a valuation of $30,000,000. Since the funded obligations aggregate $28,700,000, out of $1,300,000, therefore, the company must meet the expenses of three years of receivership and the attendant foreclosures, refinance the above amount of obligations and provide some sort of an equity for almost $6,000,000 of stock. Mr. Wilcox may be able to figure out the "velvet" in this sort of a proposition, but neither the owners nor the managers of the property have yet been able to do so.

The new Kansas City franchise, as fixed, is the result of negotiations extending over a two-year period. The city was represented by a large staff of eminent council, among whom was United States Senator James A. Reed. The company was likewise well represented. During the negotiations both parties submitted the contract provisions to prominent street railway experts and financiers, and solicited suggestions. The draft of the ordinance, as it now stands, was open to suggestions for more than eight months. Hundreds of individuals have been listened to by the various committees formulating the document in the two-year interval, and in view of this fact it seems somewhat presumptuous on the part of Mr. Wilcox, after a three or four-day review, to say that the contract "has not been carefully worked out in detail" and contains "lapses from sound judgment and just bargaining," "it is vague and apparently inconsistent" and a "theoretical hodge-podge."

As to the guarantee of the company's return, the contract very clearly states "if and when earned," and if it is a crime in this country for a street railway company, after providing "best first-class modern service" to be entitled to a 6 per cent return "if and when earned," then the Kansas City document perhaps is open to criticism.

During the campaign which preceded the adoption of the contract, one of the greatest sources of annoyance to the company, which was trying by every legitimate way to educate the populace to the provisions of this ordinance, was the misleading and half-baked information put out by the newspaper opposing this contract under the guise of interviews with so-called prominent street railway experts. We were troubled with the usual corps of "soldiers of fortune." There were several stories from the ex-reverend Bigelow of Cincinnati. Mr. Barcroft, the gentleman who obtained notoriety in his appraisal for the "committee of fifty" in the city of Detroit some years ago, contributed; Peter Witt entered the "going"; another gentleman, N. D. Cochrane, editor of a Toledo newspaper, qualified as an expert and advised the citizens of this community how to settle the matter; and last but by no means least, Mr. Wilcox appeared on the scene in the closing week and wrote a series of letters which certainly, even in the eyes of Mr. Wilcox's friends, did him little credit, as they proved only one thing, as did the communication of Mr. Wilcox referred to in this letter, that Mr. Wilcox had very hastily read the new contract and certainly did not understand even the essentials upon which it is based.

I trust that you may find a way to publish this letter in full in an early issue of your paper, in order that a wrong impression of the new contract may not prevail, and especially the idea that any advantages or "jokers" are contained in the proposed contract, because of the possible injurious effect on other cities which are seeking franchises.

PHILIP J. KEALY, Engineer for the Receivers.

Boosters and Regulated Feeders in Electrolysis Mitigation

DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS
WASHINGTON, D. C., Aug. 4, 1914.

To the Editors:

In an article in the London *Electrician* for July 17, page 607, Henry M. Sayers* gives a comparison of the results obtained with boosters and with insulated negative feeders, as described in the article in the ELECTRIC RAILWAY JOURNAL of Jan. 3, 1914, page 39. The author remarks that this article does not explicitly state that the negative busbar is insulated. It was taken to be perfectly obvious that the use of insulated negative feeders, which are all connected to the track at one end and to the busbar at the other, requires that the busbar be not grounded directly. Indeed, in a second article (ELECTRIC RAILWAY JOURNAL, Jan. 17, 1914, page 116) the fact that in some of the tests the busbar was grounded, in order to permit a comparison of results obtained with grounded and ungrounded buses, was expressly stated. The resistance taps which are placed between the rail and the busbar for the purpose of maintaining the necessary difference of potential between them would, of course, be ineffective if the busbar were grounded directly. Mr. Sayers assumed that the use of a potential drop of 1 volt per thousand feet on the average for twenty-four hours was advocated. This, however, is a mistake. Such a figure was taken merely for illustration, as the first article discussed principles and not numerical details. In the second article the statement was made that 1 volt per 1000 ft. at peak load had been used as the basis of calculation, which would be, perhaps, 0.4 volt per 1000 ft. reduced to a twenty-four-hour average. A uniform drop is not advocated in all cases, however, as conditions are so different that what is a sufficiently small drop at one place may not be such in another.

Mr. Sayers assumes in his calculation that the drop in potential is equal on all the feeders. This is an ideal condition which we have never yet attempted to reach in practice. For the sake of economy we have always allowed some slope of potential on the tracks toward the substation in order to utilize the conductance of the track as much as possible, keeping below the permissible potential gradient. There has been, therefore, a smaller drop of potential in the short feeders and the resistance taps closest to the station than in the longer feeders.

In reference to the advantage of negative boosters over insulated feeders with resistances, in that the boosters provide automatic voltage regulation due to their series winding, the author seems to have overlooked the fact that the resistances give the same regulation since the drop across them is proportional to the load on the feeder with which they are connected. By selecting a resistance material with the proper temperature coefficient the action of a compound-wound generator can be approximated, the only difference being that there will be a slight lag in the regulation of the resistance due to the time required for changes in temperature. Provision can be made for hand adjustment of the voltage drop as easily as in the case of the generator. Such adjustments will not usually be necessary, except in the case of a permanent change in the relative traffic distribution or of a large increase in the station load.

As to the possibility of designing feeders with reference to maximum economy, it has always been our custom to design the negative feeder system in such a way as to make the cost of energy lost in feeders and resistances approximately equal the annual charge on the entire negative feeder system, and to make the sum of the two charges as low as the limit of over-all potentials and gradients will permit. We also carefully estimate the cost of producing the same results by other methods including the use of boosters.

In our calculations of the relative cost of using boosters and insulated feeders without boosters, we have never found a case where the saving in power by the use of boosters was sufficient to justify the extra investment, the space occupied by the machines and the care of the machines. As we have pointed out, inverted boosters might be used to advantage in some cases for recovering some of the energy otherwise expended in the short feeders and resistance taps, but although inverted booster are possibilities and in some cases their use may prove advantageous, we have not as yet found a case where we could recommend their installation. There must be cases, however, where ordinary boosters, and other cases where inverted boosters, would be entirely practicable.

As to Mr. Sayers' remark that using boosters obviates the necessity of raising the voltage on the main generators, this is something that we have not overlooked but we consider it better to get the extra voltage needed by means of the main generators rather than by the boosters, inasmuch as the former are more efficient and it is simpler to produce the needed voltage in this way.

We thoroughly agree with Mr. Sayers' concluding re-

---

*An abstract of Mr. Sayers' article is published on page 254 of this issue.

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

mark that in every case it is worth while to calculate the expense of installation and operation by different methods before proceeding with the work. It is not our intention to advocate any particular system of electrolysis mitigation, but to use and recommend the methods that give the best results for each particular case.

E. B. ROSA, Chief Physicist.

Control for Highway Crossing Signals

NACHOD SIGNAL COMPANY
NEW YORK, Aug. 3, 1914.

To the Editors:

Your interesting editorial on highway crossing signals in the issue of July 11 does not, to my mind, convey the fact that the ideal control given by the continuous track circuit is attained by intermittent contact devices only when the control is car-counting and directional at the same time. For a single track crossing having three contactor locations this combination is rather difficult, but has been worked out.

CARL P. NACHOD.

Maintenance Costs of Car Equipment

L. B. STILLWELL, CONSULTING ENGINEER,
NEW YORK, Aug. 6, 1914.

To the Editors:

The editorial in your issue of July 25, in reference to the comparative maintenance costs of car equipment on the New York, Westchester & Boston Railway and the Hudson & Manhattan Railroad, has been read with interest, as it calls attention to the operating results which can be attained with either a. c. or d. c. equipment when the three essential elements of apparatus, facilities and organization are selected, developed and associated in a harmonious manner, to meet the specific conditions of operation of a transportation system.

It is obvious that if the motive power apparatus is inadequate or of faulty design; if the shop facilities are insufficient or unadapted to the purpose, or if the personnel of the shop organization is untrained or incapable of developing full efficiency due to specific causes, the results will be reflected in the cost of operation and in the reliability of service.

Every item of car equipment on the Westchester and on the Hudson & Manhattan cars was selected or developed to meet its special duty, every feature of shop construction and equipment was selected and arranged to best promote its usefulness. That the organization, in both cases, is in efficient hands is obvious from the results secured.

It would seem that the results attained in the operation of both of these roads are such as should go far to convince even the most skeptical that both d. c. and a. c. motive power apparatus is now developed to a point where the cost of inspecting and maintaining the rolling stock and its equipment is a comparatively small factor in making up the aggregate costs of operation. Moreover, the development of both types of apparatus is progressing steadily, through the co-operation of various manufacturers, operating men and engineers, and further, although minor, economies in operating costs and gain in reliability of operation will result. Of the contrasted systems, the a. c. is the newer, and it is to be expected, therefore, that additional equipment for the Westchester road will show still further improvement in operating characteristics, and as the overhead charges now carried by thirty cars will not be materially increased, the cost of maintenance per car mile with the Westchester a. c. equipment, on the basis of 100 cars, should be well under 2 cents.

In comparing the two systems it should be noted that the ratio of horse-power of motors per ton of rolling stock is much greater in the case of the Hudson & Manhattan than in that of the Westchester. In other words, the a. c. equipment of the latter performs much heavier duty than does the d. c. equipment of the former.

The excellent results attained in both cases are due in no small measure to the intelligence and vigilant skill of the respective operating organizations.

L. B. STILLWELL,
By F. M. BRINCKERHOFF.

Production of Steel Ingots and Castings

The bureau of the American Iron & Steel Institute has issued Statistical Bulletin No. 5, which contains figures relative to the production of all kinds of steel ingots and castings in the United States, which in 1913 amounted to 31,300,874 tons, against 31,251,303 tons in 1912. While the production in 1913 was the largest in the country's history, it was only 49,571 tons greater than the output in 1912. Of the total production in 1913, 30,280,130 tons were ingots and 1,020,744 tons were castings, against 30,284,682 tons of ingots and 966,621 tons of castings in 1912.

In 1913 there were 304 works in thirty states, the District of Columbia and the Canal Zone, Panama, which made steel ingots or castings, as compared with 306 works in thirty-one states, the District of Columbia and the Canal Zone, Panama, in 1912.

The following table gives the production of all kinds of steel ingots and castings by processes since 1904, in gross tons.

Years—Ingots and castings —Gross tons	Bessemer	Open-hearth	Crucible	Electric and all other	Total ingots and castings
1904	7,859,140	5,908,166	83,391	9,190	13,859,887
1905	10,941,375	8,971,376	102,233	8,963	20,023,947
1906	12,275,830	10,980,413	127,513	14,380	23,398,136
1907	11,667,549	11,549,736	131,234	14,075	23,362,594
1908	6,116,755	7,836,729	63,631	6,132	14,023,247
1909	9,330,783	14,493,936	107,355	22,947	23,955,021
1910	9,412,772	16,504,509	122,303	55,335	26,094,919
1911	7,947,854	15,598,650	97,653	31,949	23,676,106
1912	10,327,901	20,780,723	121,517	21,162	31,251,303
1913	9,545,706	21,599,931	121,226	34,011	31,300,874

Bulletin No. 6 shows that the production of iron and steel plates and sheets in 1913, excluding nail plate and skelp, but including black plates, or sheets, for tinning, amounted to 5,751,037 tons, against 5,875,080 tons in 1912, a decrease of 124,043 tons, or more than 2.1 per cent.

Joint Committee on Stresses in Railroad Tracks

The American Railway Engineering Association and the American Society of Civil Engineers have appointed a joint committee of about eighteen members, including a number of very prominent railway officials, to investigate the problem of stresses in rails, ties and ballast. A large sum of money has been set apart for the initial tests. Professor A. N. Talbot, of the University of Illinois, is chairman of the committee, and the testing work will be done in the laboratory of applied mechanics in that institution. Professor H. F. Moore is acting as engineer of tests and Professor H. R. Thomas will assist as a testing expert. Preliminary designs have been prepared and the trying out of special apparatus for testing is now in progress in the laboratory at Urbana.

Professor Talbot states that it is planned first to make tests of the track under static load and that, as soon as the proper instruments can be developed, tests will be made with locomotives at various speeds. The joint committee plans to hold a meeting in the near future and definite plans of testing will then be outlined.

American Association News

Below Are Given a Preliminary Announcement of the Program of the Atlantic City Convention—Brief Minutes of Standards Committee Meeting—Notes on Committee Activities—Additional Details Regarding the Award of the Brady Medal

PROGRAM OF AMERICAN ASSOCIATION

Secretary Burritt, of the American Electric Railway Association, has just made public a list of the topics which will be considered at the meeting in Atlantic City next October. These topics, with a short explanation of each as prepared by Mr. Burritt, follow:

1. Mooted Principles in Valuation. The importance of valuation of the property of electric railway utilities is growing, and there appears to be an attempt on the part of at least one of the national engineering societies to formulate definite economic principles to serve as a guide for engineers in the valuation of such properties. An extended discussion of the various theories, so far developed for the purpose of measuring the value of public utility properties, should prove desirable.

2. The Organization and Functions of a Valuation Staff. This discussion will deal with the organization and functions of a staff for the valuation of the property of a public utility, and will indicate the relations that should properly exist between the legal, engineering and accounting departments.

3. Electric Securities from the Standpoint of the Corporation. At the last two annual conventions there have been presented papers on electric railway securities. Mr. Harris' paper at the last convention on "Electric Railway Securities from the Investor's Viewpoint," treated the subject almost exclusively from the standpoint of the investor. There are many other things related to electric railway securities that have not been covered by the papers heretofore presented which it is important for the public, the investors and the corporations to know.

4. The Milwaukee Zone System in Practice. There has recently been installed in operation a zone system of fares outside the single-fare limits in Milwaukee, and the other communities served by the lines of the Milwaukee Electric Railway & Light Company and Milwaukee Light, Heat & Traction Company, which has for its basis a fare unit of 2 cents, associated with a distance unit of 1 mile. The operation of this system of fares is being watched by a number of electric railway people with interest.

5. Aspects of Workmen's Compensation Acts. The increase in the number of States providing for a definite compensation for workingmen injured while engaged in their employment makes this subject of more than passing interest to the employers of labor. Experience in the operation of such laws in this country and abroad may indicate directions in which modifications are desirable, and in which legislation of this nature should properly tend.

The secretary also says that the committee on public relations will present a "Platform of Principles," and that the committee on the joint use of poles will present a form of agreement and specifications.

CONVENTION RAILROAD RATES

The several passenger associations have announced their respective provisions in regard to rates to and from Atlantic City, as follows:

Trunk Line Association (New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, northern part of Virginia and West Virginia); two cents a mile with minimum of $1 for a round trip, going and returning by same route only; tickets to be sold and good going Oct. 10 to 12 and returning to starting point by Oct. 20.

Central Passenger Association (West of Buffalo, Pittsburgh, Wheeling, Parkersburgh and Huntington, W. Va., to and including Chicago, St. Louis, north of the Ohio River, including Cincinnati, Louisville, and Cairo, Ill.); two cents per mile, same date limits as above.

New England Passenger Association (East of New York Central & Hudson River Railroad and a line drawn from Albany north through the Hudson River and Lake Champlain, but not including Rouse's Point, N. Y.); two cents per mile, going and returning by same route only and over which one-way tickets are regularly sold. Reductions apply only from principal stations where tariffs are on file and through tickets are in stock. Forty-eight hours notice will be required at other stations. Date limits same as above and reductions will not apply on Bangor & Aroostook Railroad.

Transcontinental Passenger Association (Pacific Coast and other Western territory not otherwise covered); no special rates have been made but the regular excursion tickets can be secured at a rate of fare of about two cents per mile.

NEW MEMBERS, A. E. R. A.

The Kansas City, Kaw Valley & Western Railway Company, Bonner Springs, Kas., has enrolled as a company member. During the past month fifteen individuals also have joined the association.

MEETING OF THE STANDARDS COMMITTEE.

A meeting of the standards committee of the American Electric Railway Engineering Association was held in New York August 6 and 7. The meeting was an exceptionally important one owing to the fact that it was the last to be held before the convention of the association in October, and a large number of recommendations from the various standing committees were taken under consideration.

At the meeting were present: H. H. Adams, superintendent shops and equipment, Chicago Surface Lines, chairman; Martin Schreiber, engineer, maintenance of way, Public Service Railway of New Jersey, vice-chairman; F. R. Phillips, superintendent equipment, Pittsburgh Railways; G. W. Palmer, Jr., electrical engineer, Bay State Street Railway; E. R. Hill, consulting engineer, Pennsylvania Railroad; W. H. Roberts, superintendent motive power, Northern Ohio Traction & Light Company; F. B. H. Paine, consulting engineer, New York, and E. B. Katté, chief engineer electric traction, New York Central Railroad.

R. C. Cram, assistant engineer of way and structures, Brooklyn Rapid Transit Company, was also present as the representative of the committee on way matters, in place of C. S. Kimball of the Washington Railway & Electric Company. E. B. Burritt, secretary American Electric Railway Association, also attended the meeting, and J. H. Hanna, chief engineer Capital Traction Company, president of the American Electric Railway

Engineering Association, and B. F. Wood, chief engineer United Gas & Electric Corporation, New York, were present on Friday.

During the two-day session there were considered nine recommendations of the committee on equipment, eight recommendations of the power distribution committee, five recommendations of the committee on way matters, and one of the committee on heavy electric traction.

ANTHONY N. BRADY MEDAL COMMITTEE APPOINTED

The committee on award of the Anthony N. Brady medal has been appointed. The conditions under which this medal is to be presented to the electric railway company making the best record for safety and safety appliances were published on page 1037 of the issue of this paper for May 9. The medal has been given by the family of the late Anthony N. Brady and will be awarded by the American Museum of Safety, New York, upon the recommendation of a committee appointed by the American Electric Railway Association.

The committee on award now appointed consists of: B. J. Arnold, chairman, Board of Supervising Engineers, Chicago, Ill.; James H. McGraw, president, ELECTRIC RAILWAY JOURNAL, New York; Will J. French, commissioner, Industrial Accident Commission, San Francisco, Cal.; Prof. Geo. F. Swain, chairman, Transit Commission, Boston, Mass.; Frank J. Sprague, consulting engineer, New York.

Under the conditions of competition the railway companies who desire to compete for the medal must file a report showing the extent to which they have conserved the safety and health of the public and their employees during the twelve months ending June 30, 1914. These reports are to be on a special form, supplied by the American Museum of Safety, New York, and drawn up by a committee of the American Electric Railway Association composed of Arthur W. Brady, C. S. Sergeant and Frank Hedley. Blanks of this kind were mailed to all operating electric railway companies under date of June 15, and the returns must be filed by Aug. 31, 1914.

The American Museum of Safety reports that it has already received communications from a number of the principal electric railway companies indicating great interest in the competition. It has also complied with a number of requests for additional copies of the forms where these have been desired, presumably to enable a large company to send copies to the heads of the different departments so that the data could more easily be compiled. As yet few returns have been received, and the Museum wishes to call attention to the fact that all reports of this kind must be received by the end of this month.

MANUFACTURERS' ASSOCIATION.

The American Electric Railway Manufacturers' Association has sent out a circular letter inviting advance registration for hotel accommodations for the convention of the American Electric Railway Association, which is to be held in San Francisco from Oct. 4 to 8, 1915. While the hotel rates are not given, the statement is made that the committee of the association and the local committee in San Francisco have done everything possible to secure the best rates and arrange for location of rooms, all of which will be guaranteed. Reservations are to be made in the Palace, the San Francisco or the Fairmont Hotel. No definite assignments are to be made now, but applicants who return the forms properly filled in before Aug. 20 will be assured of accommodations.

During the past week six new members have been secured for the association, as follows: the Standard Corporation, Philadelphia, Pa.; the Imperial Car Cleaner Company, Newark, N. J.; the Wyoming Shovel Works, Wyoming, Pa.; the Blake Car-Step Company, Charlotte, N. C.; the Johnson Fare Box Company, Chicago, Ill., and the Morgan Crucible Company, Ltd., New York, N. Y. Secretary McConnaughy is literally bombarding the members with circular letters dealing with details of the exhibits and entertainments planned. He calls attention to the closing of the Hotel Traymore, which is now being remodeled, and suggests that those who have been in the habit of going there can secure similar accommodations at the Strand Hotel, where a chair station will be located for the convenience of the attendants at the convention. Other letters explain the arrangements for furnishing flowers, plants, etc., and oriental rugs.

Results of Public Utility Regulation in California

The question "Does regulation hurt business?" was discussed by John M. Eshleman, president of the California State Railroad Commission, before the Chamber of Commerce of San Francisco on July 31. Figures were quoted to show that there had been a greater development of public utility enterprises since the commission had received jurisdiction over stock and bond issues (March 23, 1912) than during any other period of equal length in the history of the State.

Up to June 30, 1914, the commission has authorized the issue of $284,000,000 in securities, Mr. Eshleman said, and had denied or dismissed applications for $32,000,000, and is now considering applications for issues totaling $82,000,000. For the steam railroads of the State in that period there has been authorized $126,000,000 of securities; for electric railways, $41,000,000; for gas and electric companies, $80,000,000. A total of more than 700 miles of railway has been undertaken and carried forward under the regulation of the California commission. This is only a part of the actual development, he said, as the sums for new equipment will approximate $15,000,000. Gas and electric companies are spending $80,000,000 for projects under regulation.

Mr. Eshleman said that the California commission had adopted the principle of protecting a public utility in its field of operation so long as that utility properly performed its duties to the public. Nearly all the men in control of public utilities regard regulation as helpful, he pointed out, as an aid in financing new utility projects or the extension of those already established.

On the other hand, rates shown to be discriminatory or unjust have been adjusted to the great benefit of the patrons. Instances cited were cheaper freight rates and reduced long distance telephone tolls. The former in some cases were so abnormal as to contribute a positive barrier to business enterprise. Wells, Fargo & Company, for instance, had been reaping annually in California a profit of 136 per cent in the express business. Mr. Eshleman said that if it was hurting business to reduce that profit to a 10 per cent rate, then this was a business that ought to be hurt.

A public utility is monopolistic in its nature as it deals directly with the individual. Alone, the individual is powerless. Simple justice requires that the State provide a tribunal to control the relations between the public utility and the individual patrons. It was pointed out that jurisdiction over public utilities should embrace the regulation of rates, service and finances, and that the question is no longer "Does regulation hurt business?" but has now become "shall it be regulation or shall it be public ownership?"

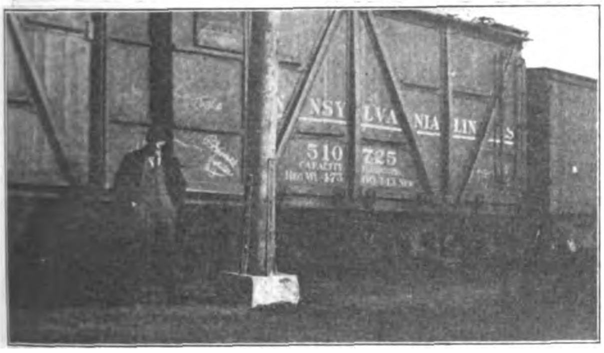
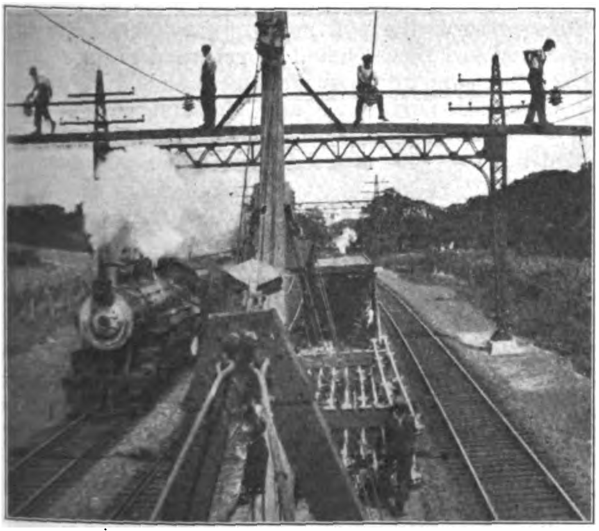
New Haven Railroad Construction Notes—Lengthening Catenary Poles

BY R. M. M. BURTNETT, FORMERLY INSPECTOR NEW HAVEN RAILROAD ELECTRIFICATION

At one of the sidings installed during the electrification of the New Haven Railroad it was necessary to use a longer pole than we had on hand. To do this we made a concrete base of 1:3:5 mixture. The base was made in oblong form about 2 ft. x 2 ft. x 6 ft. high, fitted with four pieces of 2½-in. x ½-in. strap iron which extended about 4 ft. above the base and about 5 ft. into the concrete. At the top this form was reinforced by an 18-in. diameter ring of 2-in. x ½-in. strap iron. The vertical pieces of strap iron had holes in the ends above the top of the base spaced about 12 in. apart for ¾-in. bolts 13 in. long. These bolts were so set in the form that the holes would come opposite each other in pairs but the pairs themselves were in staggered relation. The pole holes were dug, the forms put directly into the hole and then the concrete was poured in. After the forms had hardened the pole to be set was raised with a gin-pole and lowered into the iron form. However, to facilitate drainage the pole was raised and kept 1½ in. above the foundation by inserting a block under it. Then the pole was bored to correspond to the holes in the iron strap and ¾-in. bolts were inserted through the holes to hold the pole firmly in place. These poles were installed late in 1913 and, so far as I know, have stood up satisfactorily. One of these poles during and after its erection is shown in two accompanying views.



COMPLETE POLE IN CONCRETE BASE



SETTING THE POLE IN CONCRETE BASE

Equipment Defects—Fuses, Fuse Blocks and Fuse Boxes—II

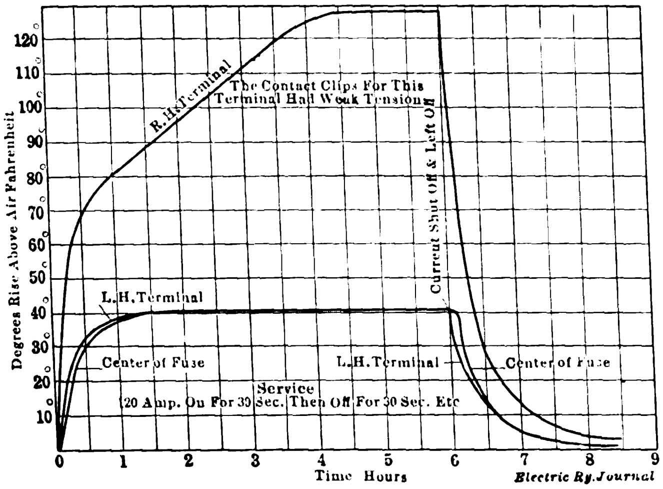
BY C. W. SQUIER, E.E.

In deciding on the proper size fuse for any particular service, the overload time element should be considered in connection with the smallest current that would prove dangerous to the equipment. Where these are to be used in the main motor circuit of cars, and consequently where fuses of large capacity are required, it is better to make tests of the fuses rather than try to choose one from the rating given by the National Electrical Code, because this standard rating allows a greater variation in the time fuses will blow cold than is desirable or will be found with most standard fuses. The accelerating current for the motors of railway equipments is much higher than the full load rating of the motors. Hence in selecting proper fuses for traction motor service it is necessary to use those large enough not to blow under maximum service conditions and still small enough to provide ample protection against dangerous overloads. Thus on a particular class of cars it was found that the equipment would stand overloads of 450 amp for from six to eight minutes. The main wiring, however, was No. 3 rubber insulated wire, and when a current of 450 amp was passed through a piece of this it was found that after four minutes the insulation on the wire started to melt, at the end of nine minutes the insulation started to burn, and then as the solder began to run out of the terminals it was necessary to shut off the current. Tests were then made on several sizes of fuses by blowing them cold with 450 amp continuously. It was found that the 300-amp fuses blew in from three minutes forty-nine seconds to four minutes and five seconds. It is evident from this that these particular 300-amp fuses could be used on this equipment, while we could not think of using a 300-amp fuse from the National Electrical Code standard rating, which allows a maximum of twelve minutes to blow with 450 amp.

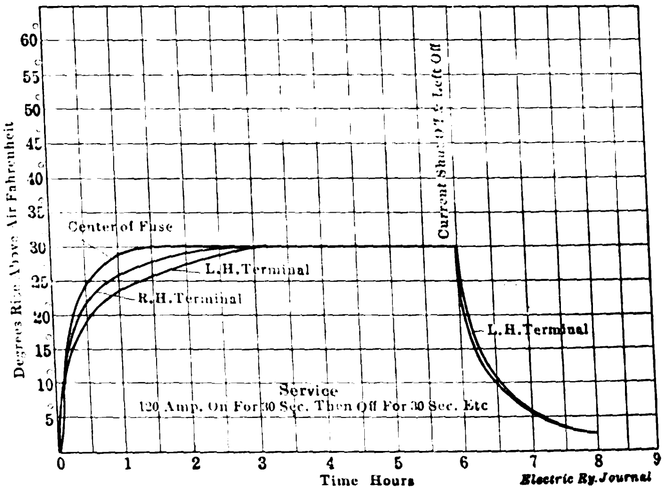
In order to determine if fuses of smaller capacity than 300 amp could not be used temperature tests were made under conditions approximating actual service. This test service consisted of placing 200 amp through the fuses for thirty seconds and then shutting the current off for thirty seconds, when it was again turned on, etc. These tests showed that 250-amp fuses would perform the service satisfactorily if the fuse block terminals were kept in good condition with firm contact pressure, but with terminals and clips as found in service in most cases 250-amp fuses would be blown due to the excessive heating.

As an example of the high temperatures that may be caused by poor contact pressure on the fuse terminals, examine the temperature curves for a 150-amp fuse. The test was made with a fuse and fuse block just as it was removed from a car, and these, as far as external inspection would show, were in good condition. This test was made by placing 120 amp through the fuse for thirty seconds and then turning the current off for thirty seconds, etc. A temperature rise of 128 deg. Fahr. above the surrounding air was obtained at the right-hand terminal, while the left-hand terminal and center of the fuse showed but 41 deg. rise. A second test was made on this fuse with a new fuse block with the results also reproduced. The maximum rise of all parts of the fuse in this latter case was but 30 deg. Fahr., and this temperature became constant after being in service 3¼ hours.

Some curves in the first part of this article show the effect of the temperature of fuses on the time taken for them to blow, so it can readily be seen how important it is to maintain proper contact at the terminals in order to keep fuses from blowing under normal operating conditions. Excessive heating may also be caused by poor contact in the construction of the fuses themselves, as between the caps and terminals, if they are not properly soldered or at the joints of the fusible material and its terminals. The specifications of the National Electrical Code have provided against such faulty construction by calling for the attachment of the fusible element to its terminals by a thoroughly good connection, such as to make it difficult for the element to be replaced when melted.



CURVE SHOWING HIGH TEMPERATURE DUE TO POOR CONTACT PRESSURE ON THE FUSE TERMINAL



CURVE SHOWING REDUCTION IN TEMPERATURE RISE AFTER APPLICATION OF NEW FUSE BLOCK

The warping of the fiber cartridge also causes poor contact at the terminals, and its shrinking causes loose ferrules or caps. Such fuses are dangerous to operate because the arc escapes through the opening and is liable to cause a short-circuit.

Vent holes, which are closed by screens, are provided in the ends of the caps. These vent screens should be of a material which will not absorb moisture readily and which must also be strong as they must withstand much pressure when the fuse opens. The blowing out of the flame through the vent holes is another source of trouble and danger.

Some manufacturers provide their fuses with telltales or indicators to show when the fuse is blown. These are a great convenience and aid in locating a blown fuse quickly, thus preventing many annoying delays in service. Indicators are not required by the insurance interests but are purely the result of trade demand. The most common form of indicator consists of a piece of very fine wire connected to the fuse terminals in parallel with the fusible element. At the center of the tube this wire is looped through to the outside and covered with a small spot of flash powder. When the fuse blows current passes through this fine wire and its heating causes the flash powder to explode. On low-voltage fuses trouble has been experienced by the failure of these telltales to blow when the fuse opens because the resistance of the fine wire is so high that the low voltage cannot force enough current through it to heat up the wire sufficiently. As the circuit still remains closed through this high resistance, however, false operation of the equipment is obtained.

REFILLING FUSES

Three or four manufacturers have developed lines of fuses so constructed that the fusible element can be easily and cheaply renewed by the user. This would be an advantage if we could be assured that the reliability which we have been led to expect of all fuses is not lessened and the fire hazard to the electrical equipment thus increased. Inclosed fuses require great care in their construction to make them operate satisfactorily and uniformly. Any type of fuse which provides for their reloading by a class of labor unskilled in fuse construction will not prove reliable. For this reason inclosed fuses should be returned to the factory for refilling, and the manufacturers should be allowed to replace any parts with new material, so that when a fuse is returned after being refilled it can be depended upon to give as good service as a new one.

RIBBON FUSES

For large railway equipments a fuse consisting of a copper ribbon with a hole at the center, or a bare copper wire is used. When copper ribbon is used it is clamped at the ends by wedge-shaped blocks, which draw into place with hand screws and exert a great pressure at the contact surface. The fuse and terminals are mounted in an insulated box having a magnetic blow-out to aid in extinguishing the arc when the fuse blows. Where such fuses are used as contact shoe fuses they are usually mounted on the shoe beam, and the principal troubles are the result of the excessive vibration to which they are subjected. Copper ribbon fuses break at the center and at the edge of their support. Small insulated projections on either side of the fuse to give it support have greatly reduced the number of broken fuses. A spring-supported fusebox will also remedy much of the breakage. The attachment of the fusebox covers has also proved a serious problem. Where hinges are used they are likely to shake loose and even thumb screws work loose and drop off. A through bolt provides the most satisfactory fastening, but it has the disadvantage of requiring a long time to remove when necessary to replace a fuse.

The Practical Side of Vacuum Car Cleaning—Tools

BY S. L. GUTHORN, E.E.

For the adequate cleaning by vacuum of cars equipped with cross-seats, the mere general requirements of vacuum cleaning are insufficient. Certain additional conditions are necessary. These relate to the renovator or tool equipment. Unless this is good, the system is a failure even though the remainder be perfect. The sufficient and necessary special tools are here discussed.

THE BARE FLOOR RENOVATOR

Correct and necessary manipulation for car floor cleaning is not possible within the space available. Most of the dirt occurs beneath the seats, and this part of the car is the most difficult surface a vacuum tool is called upon to sweep. To sweep such a car floor properly the tool must have the following characteristics:

a. It must be able to assume the best possible, and all necessary, positions on the floor beneath the seats, independent of any obstruction due to the legs.

b. It must be capable of removing and passing all such bits of paper, cigar butts, etc., which the bore selected will transmit without plugging.

c. It must not push surface dust in advance of it.

Of these requirements, the first is difficult to obtain and needs a construction which permits the following:

1. With the tool on the floor, the handle must be able to assume any and all angles necessary to work beneath a seat, these angles being taken in any vertical plane.
2. The control of the tool must be such that the operator may rotate it on the floor at will by means of the handle and yet not disturb its correct position, thus obtaining any angle in a horizontal plane.
3. Conditions 1 and 2 must be capable of occurring simultaneously.
4. The length of the tool must not exceed the distance between adjacent seat supports.

The basis of such a tool is a modified ball and socket joint. The joint *A* of Fig. 1 fulfils condition 1. The studs *B B*, which are integral with the socket and connected to the ball through the grooves, *C*, fulfil condition 2 and permit condition 3. The length into the clear is fixed by condition 4 but should not exceed 10 in.

Condition *b* calls for a long central "gobble up" orifice, *D*, which by its conical shape accelerates the material swept and crumples pieces of paper, cigar butts, etc.

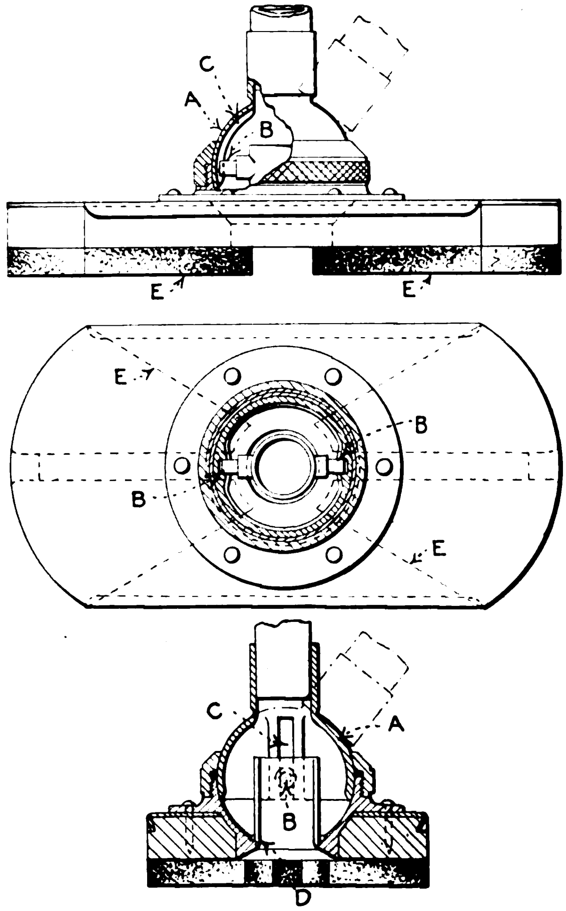
Condition *c* calls for dust ducts, *E*, in the front and back of the tool, instead of at the ends only. These ducts, inclining toward the center orifice, direct the material swept toward the same and effectively prevent the pushing of surface dirt.

The tool when operated with a 3-ft. handle and a handle valve allows a free and unrestricted universal movement which enables the operator to rotate the tool on the floor and around the seat legs, as required, while the handle is at any angle which the conditions may impose. Thus he directs the front or end dust ducts, namely, the air inrush, as the sweeping requires, without fatigue and independent of the obstructions caused by their upper parts. The felts are of ½-in. stock.

THE MOP

If the exhauster equipment is of a type which will handle water as well as air, the use of a pneumatic mop is advantageous. The mop will remove scrub water from a car floor and discharge the same direct to the soil line. A successful mop must possess the following characteristics: (*a*) it must remove and not soak up the water; (*b*) it must dry the mopped surface; (*c*) it must not streak the floor; (*d*) its speed must warrant its adoption; (*e*) it must be operative on both forward and return strokes, and (*f*) it should be operative beneath the seats.

Of these requirements a solution fulfilling conditions *a-e* inclusive is shown in Fig. 4, while one fulfilling all conditions is shown in Fig. 5. In both cases the construction accomplishes the following: the orifice, and no other point of mop, must be the part at which the tool meets the wetted surface; the moving of the tool over the surface must automatically raise the crest of the water sufficiently to tend to seal the orifice, decreasing the effective orifice area and thus increasing the air velocity so that the water is carried through the tool to the hose in the form of a water spout.



FIGS. 1 TO 3—BARE FLOOR RENOVATOR

In use the tool, shown in Fig. 4, requires the lowering of the handle on the forward stroke and the lowering on the return, and therefore it will not work well beneath seats. The tool shown in Fig. 5 permits the handle to be held in any working position. The movement of the mop proper is accomplished by operating the slide *c*, it being pushed for the forward stroke and pulled for the return.

The use of a plain squeegee mop with a plain rubber edge to push the water "into a pile" to be removed with mop, has worked well.

SUMMARY OF GENERAL REQUIREMENTS

In addition to the foregoing specific requirements, the purchaser should insist upon certain general ones which apply to any vacuum cleaner tool. These are:

1. The selection and distribution of materials for strength, weight and life, being brass or iron if any moving parts.
2. Dead smooth-cored parts, insuring smooth and unobstructed air passages.
3. Large radii of curvature of the tool passages.
4. Proper distribution of areas through the tool to insure uniform acceleration.
5. Interchangeability of parts.
6. Connection between tool and handle.
7. Appearance and finish.

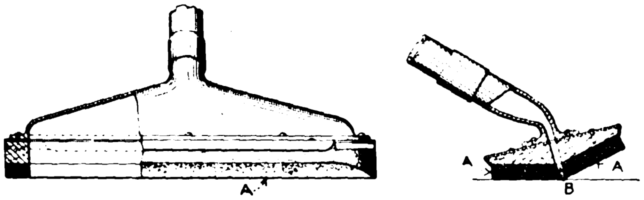


FIG. 4—MOP WHICH FULFILS CONDITIONS A TO E

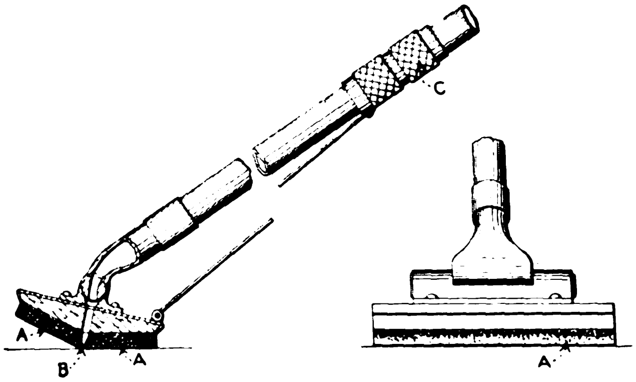

FIG. 5—MOP WHICH FULFILS ALL CONDITIONS

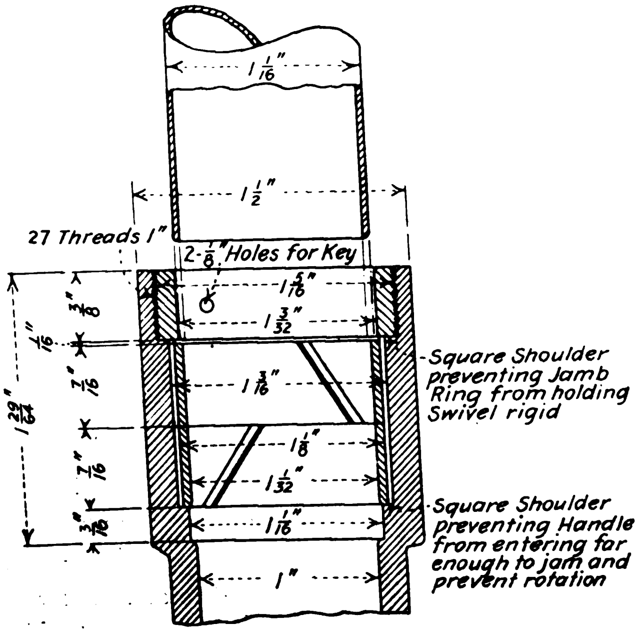

FIG. 6—DOUBLE SPLIT RING

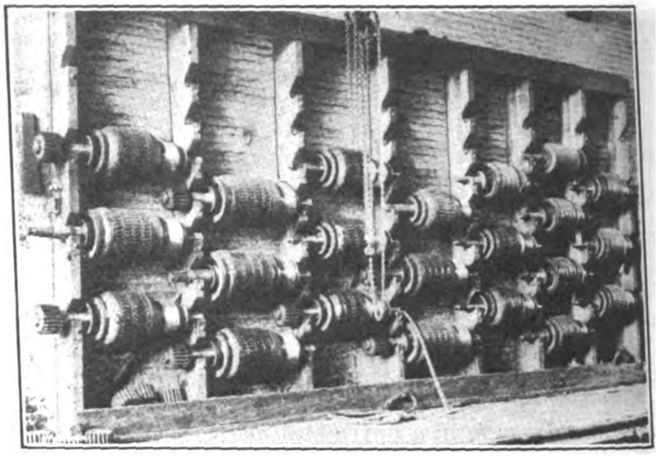
Of these, requirement 6 is worthy of further reference. Of the forms in use the double split-ring type is commendable. This device is shown for a 1-in. tool in Fig. 6. Here the duct formed by one split ring, which of itself would permit leakage, is baffled by the second split ring. Also if the periphery in contact with a ring is not circular, due to a dent or other cause, the seal is preserved by the second ring which works independent of it. The dimensions allow for the free turning of the handle in tool, and under no conditions will they stick as in other prevailing types. The upper or jamb ring screws down against a square shoulder in the shank, thus preventing it from holding the split rings rigid.

The tapered ends of the handles should be formed by swedging or rolling and never by filing or cutting. Swedging or rolling strengthen the ends while filing or cutting weakens them to a surprising extent. Hose ends for connecting to the piping system or to other lengths of hose should always be of such thickness as to fit into an outlet of a hose of the next size larger. This will warrant their having sufficient thickness to withstand car shop usage, particularly if of the tapered type.

A Vertical Armature Rack

At the Carew Street shops of the Springfield (Mass.) Street Railway armatures are conveniently stored for immediate service on a home-made rack illustrated in the accompanying half-tone. The rack is located at the side of a pit track and near the entrance of the building, so that the least possible amount of time is lost in changing an armature on a car momentarily withdrawn from service. The rack is 11 ft. high and 20 ft. long, and has a capacity of twenty-eight armatures of various sizes. It consists of notched vertical posts spaced from 2 ft. 8 in. to 3 ft. 1 in. apart on centers and tied together at top and bottom by cross timbers, the vertical members being fastened into the adjoining brick wall by ½-in. bolts forced home against iron plates to form a bearing surface on the outside of the timber. The vertical pieces are 12 in. wide and 2¾ in. thick, and the rack is served by a 1-ton "Triplex" hand-operated hoist. Armatures are supported in alternate pairs of gains as shown, the clearance being sufficient to allow for the projection of the pinion over the vertical member and to facilitate the attachment of the chain to the shaft in handling the armatures. There is a clearance of 5 ft. between the largest armature and the nearest pit rail when the rack is filled. At the bottom of the rack a storage space 8½ in. deep with a 1½-in. flooring is left for pinions in loose storage.



HOME-MADE COMPACT ARMATURE RACK, SPRINGFIELD, MASS.

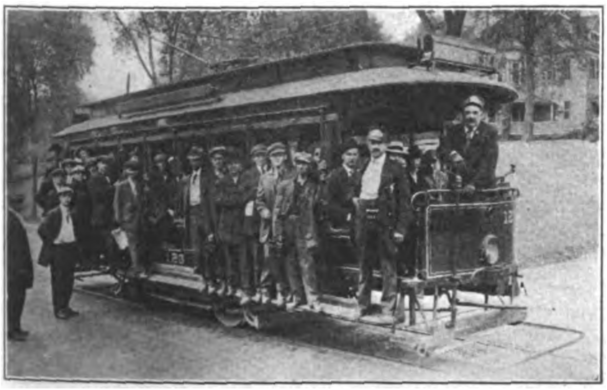
The Allgemeine Company has recently received final permits in connection with the construction of the Gesundbrunnen-Neukölln Underground Railway. The franchise is for ninety years, and it is specified that the line must be completed for operation by Sept. 30, 1918, on penalty of $50,000 for any delays. A penalty of $25,000 is also fixed if operation is discontinued or interrupted without due cause. The present terminal in Neukölln is to be at Weser Street, but provision must be made for its extension beyond that point.

Long-Lived Car Bodies

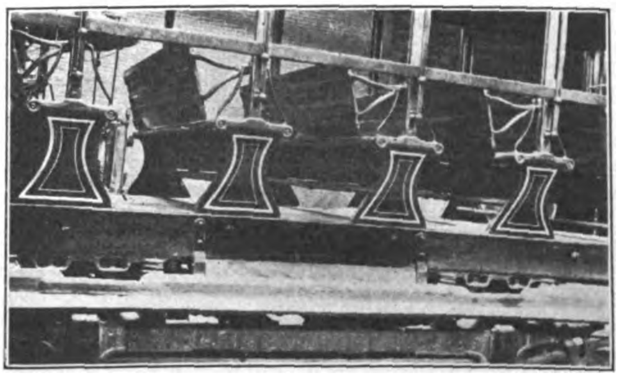
Included in the serviceable rolling stock of a large Eastern railway are twenty-two cars which were built about twenty years ago by J. M. Jones & Sons, of Troy, N. Y. Fifteen of these cars are of the open type, all but one being ten-bench equipments. The seven box cars are all of the single-truck type and are regularly employed in tripper service in the winter, the open cars being operated daily in the morning and afternoon rush hours the rest of the year. Some of the features of these cars are described below, special attention being paid to the open cars for the reason that these were equipped with motors early this summer and were accessible for closer detailed examination.

A typical open style car of this group is shown in service in Fig. 1, the photograph having been taken in June of this year. The car has ten benches and was built in 1893. The body length is 28 ft. 8 in., the platform length 3 ft. 10 in., and the over-all length 29 ft. 8 in. At present the car is equipped with a Bemis "standard" truck, two Westinghouse 12-A motors, geared 18:64, side-bar suspension and K2 controllers. The motors are inside-hung, a view of the under side of the car and a portion of each motor being shown in Fig. 4. The total width of the car is 7 ft. 9 in. The roof is of the open deck type and the weight of the car body is 7500 lb. The truck weighs 4800 lb., and the wheelbase is 7 ft., the wheels being of chilled cast iron, 30 in. in diameter, with a tread of 2½ in. and a flange depth of ¾ in. The weight of the electrical equipment complete is 5338 lb., and of the car complete 17,638 lb. Other features of the car are the use of Pantasote curtains, New Haven registers, Pfingst fenders, slat seats, U. S. trolley base and pole with G. E. harp, Wilson trolley catchers and Murphy sanders. Five 23-watt lamps provide for the inside lighting, the same size being used in the headlights. The height from the top of the rail to the trolley board is 11 ft. 1 in. Ratchet hand brakes are used, none of these cars being equipped with air. The running boards are 8 in. wide.

The inside of the body is finished in maple and mahogany. The framing, which is perhaps the most interesting feature of the car, is outlined in Fig. 2, which is a sketch of the principal members of one-half the body supporting structure. Fig. 5 shows an underside view of the drawhead and adjacent flooring. The side sills are of hard pine, the cross-pieces being of oak. No center sills were used in these cars. The side sills are each 4½ in. wide, the height varying from 7 in. at the center of the car to 5 in. at the platform ends. Across the center of the car is run a transverse member 2¾ in. wide by 5 in. high, reinforced by a ½-in. truss rod shown in one view. The posts are of oak, and they are about 2½ in. square in horizontal cross-section. There is little or no sign of misalignment or lost motion in the roof at the supporting points.

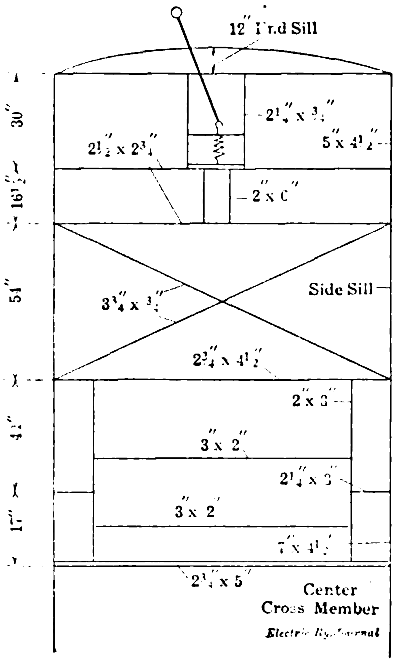


LONG-LIVED CARS—FIG. 1—TWENTY-YEAR-OLD OPEN CAR CARRYING HEAVY LOAD



LONG-LIVED CARS—FIG. 3—SIDE VIEW OF OPEN CAR SHOWING CANVAS STRIP SERVING AS MUDGUARD

The sizes of the various subordinate members of the underframing are indicated in the diagram. In each case the cross members carried from side to side are reinforced by a truss rod as in the central member referred to. The end sills are 12 in. wide at the center, curving to a width of 3 in. at the side of the car. Two cross-braces are provided under the platform, each being 2½ x 3¾ in. in section, and behind these are two 3¾-in. x ¾-in. diagonal braces. All the cross members are bolted into the side sills. This construction has proved sufficietnly rigid to stand the wear of service.

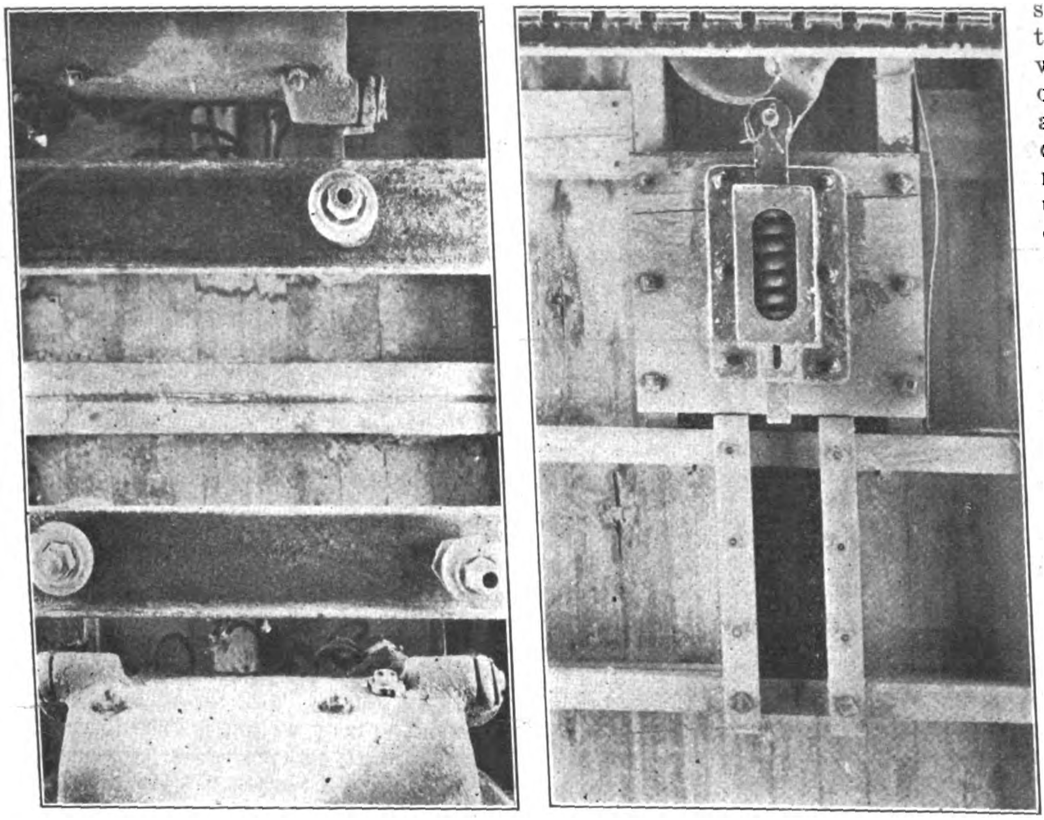


LONG-LIVED CARS—FIG. 2—SKETCH OF ONE-HALF UNDERFRAME OF TWENTY-YEAR-OLD OPEN CAR

The box cars of the Jones make are of the same general design as to framing, but naturally the platforms are wider and the vestibule construction made it necessary to stiffen the underframing at the ends of the car. The bodies of these cars are 18 ft. long, the platforms being 3 ft. 10 in. long. The over-all length of the car is 27 ft. 6 in. The body weight is 7500 lb., and the roof is of the open-deck type, carried on posts mortised into the side sills and fastened by ½-in. x 1-in. strap-iron bolts. The side sills are 3 in. x 3¾ in. in cross-section, and these are supplemented under the platforms by two knee braces from 7 in. to 3 in. deep which take care of the loads in the middle portion of the platform.

The center cross-sill is 4¾ in. x 2¾ in. in section, and through bolts are used in the open cars to reinforce the cross members. The posts are of oak, 3 in. x 1¾ in. The knee braces are offset to take care of the difference between the car floor level and the platform level. The intermediate framing construction is much like that in the open cars. All these closed cars are also in first-class operating condition, and although used mainly in tripper service, are thoroughly reliable pieces of rolling stock. The principal drawback to their extended use is their small capacity and low speed. The closed cars are equipped when in service with two Westinghouse 12-A motors each, Bemis "standard" trucks with a 6-ft. 6-in. wheelbase, and the gear ratio is 18:64. The maximum speed on a level track is 18 m.p.h. The weight of the car equipped is 17,638 lb.

The maintenance requirements of these cars are light. A yearly overhauling is given, and painting, varnishing and minor renewals of flooring, panels or other parts subject to wear or shocks from without fairly complete the work which has to be done on these bodies. On one open car body the platform has never had to be repaired since the first day of service. The following tables of maintenance cost give an excellent idea of the way in which these equipments are standing the test of time. It is noteworthy that the records begin the year with 1909, when the cars were sixteen years old. In the case of the car the figures for 1914 cover only the first six months, but include a thorough overhauling for the summer season.



LONG-LIVED CARS—FIGS. 2 AND 4—UPPER SIDE OF TWENTY-YEAR-OLD OPEN CAR SHOWING MOTOR SUSPENSION REINFORCEMENT OF CENTRAL CROSS MEMBER OF FRAME; DRAWHEAD AND UNDERFRAME OF TWENTY-YEAR-OLD OPEN CAR

First Car—Body Repairs (Open Type).

Year	Labor	Material	Varnishing (Labor and Material)
1909	$1.28	....	....
1910	1.50	....	$20.00
1911	4.00	$2.00	9.00
1912	4.40	6.00	4.00
1913	9.10	4.20	....
1914	1.50	3.00	*75.00

*Entire car repainted, including thorough scraping.

Second Car—Body Repairs (Closed Type)

Year	Labor	Material	Varnishing (Labor and Material)
1909	$0.57	....	$6.00
1910	5.25	$3.50	5.00
1911	2.55	1.25	2.75
1912	5.40	4.00	6.00
1913	....	....	3.90

The roofs, trolleys and trucks are painted yearly. Bodies revarnished when necessary.

Reduced Energy at San Francisco Due to New Motors and Rebuilt Trucks

In 1895 the United Railroads of San Francisco received 123 cars equipped with GE 1000 motors. These cars have been operating in regular service up to the present time, but it was recently decided to replace the old motors with new equipment, at the same time endeavoring to effect a saving in power consumption by decreasing the weight. Accordingly, one of the cars was re-equipped at the company's shops, and on May 2 was put on a regular run to try out under actual working conditions the features proposed for the cars to be altered. Incidentally, the alterations were to lower the car floor level.

Car No. 1367, typical of the 123 cars to be given new motors, was selected for tests of the features to be embodied in the alterations. It has a length of 44 ft. 11 in., a seating capacity of fifty-two and weighed 43,140 lb. with the old motors on Peckham 14-B-3 trucks. In the shops the trucks were taken from this car and completely dismounted, so that other changes could be made while new motors were being placed. The trucks were fitted with 24-in. instead of 30-in. wheels, brakes were hung inside instead of outside, and the bolsters clamped beneath instead of above the half-elliptic springs. These changes lowered the level of the car floor 6 in., and in order to maintain the 12½-in. height of the bottom step, made necessary by the dips and crowns of the line, the risers of each of the other two steps were reduced from 13 in. to 10 in.

No other changes were made in the car until it had been in service long enough to permit a number of tests. After these were made it was sent to the shop again, one of the two resistance boxes was removed and the K-12 control was rearranged for operation on seven points, in accordance with the Jones patent described April 11. This rearrangement, without changing the car wiring, resulted as follows:

Point 1—All four motors in series with resistance.
Point 2—Four motors in series.
Point 3—No. 3 and No. 4 motors in series.
Point 4—Series-parallel (two motors in series and two in parallel).
Point 5—No. 1 in parallel, Nos. 3 and 4 in series.
Point 6—Nos. 1 and 4 in parallel.
Point 7—Four motors in parallel.

The total cost of these alterations per car were about as follows:

Rebuilding trucks	$150
Rewiring control	20
Cutting down step heights	12
Four Jones baby-type motors	1,500
Total	$1,682

RESULTS OF TESTS

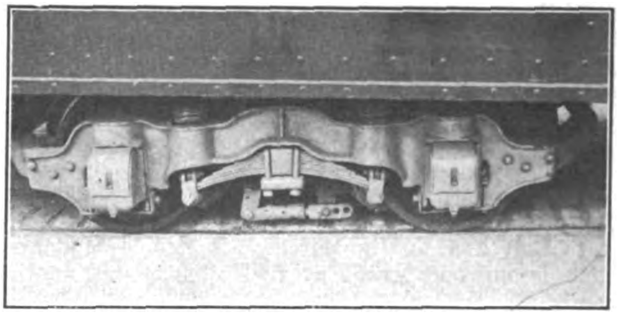
The tests were made on the Fillmore Street run which extends from Broadway to Sixteenth and Bryant Streets and involves about the average number of stops and several hills, the steepest grade being 11.7 per cent for two blocks. Typical results obtained in the three all-day tests made under conditions as nearly identical as possible in practice are given in the following table.

COMPARATIVE TEST RESULTS

Test Series	Motor	Car Weight Pounds	Control	Number Trips	Total Miles	Total Kw-hr.	Av. Kw-hr. per Car Mile
1	GE 1000	43,140	K-12	12	79.342	307	3.869
2	West. 328	36,920	K-12	13	85.530	287	3.355
3	West. 328	36.920	Rearranged K-12	13	84.594	258	3.049

The difference between Series 1 and 2 represents the saving in energy consumption due to the substitution of the new motor and the reduction of car weight. This amounts to 0.514 kw-hr. per car mile, or 13.28 per cent. The difference between Series 2 and 3 shows the further economy due to the rearranged control, which amounts to 0.306 kw-hr. per car mile, or 9.121 per cent more. The total saving shown between Series 1 and 3 is 0.82 kw-hr. per car mile, or 21.19 per cent. Series 3 was made on May 7, which was "California Day" at the Exposition, so that any variation in the number of passengers carried probably tended to make for heavier loading during Series 3.

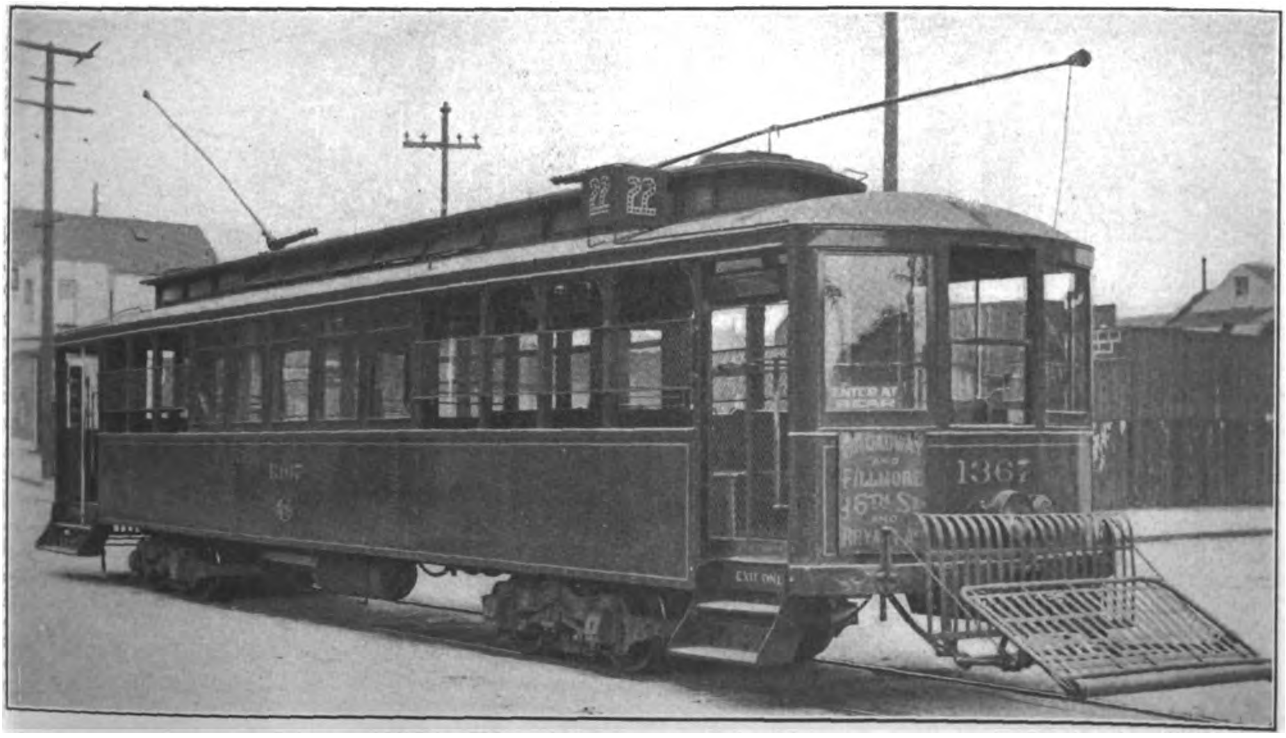
The load curve for the rewired seven-point control was taken with a graphic ammeter and in connection with this there was also used an integrating watt-hour meter made with mercury bearings especially for railway use by the General Electric Company. The resultant curve differed from those of the old-type control by its lesser area, of course, but it also had a sharp, high peak due to the reduced resistance used. This peak was often as high as 350 amp, but its apex was nearly always 100 amp above the point where there was any perceptible width between the two lines made by the rising and falling pen while the paper was advanced at the rate of 2 in. per minute. The sharpness of the peak was not due to the inertia of the moving element in the meter, however, as an external dampening current of constant value was used, which is said to have kept the instrument practically dead beat.



UNITED RAILROADS OF SAN FRANCISCO—TRUCK REBUILT FOR LIGHTER CAR AND LOWER FLOOR

The trucks were rebuilt and the control rewired under the supervision of J. M. Yount, master mechanic, and the tests were made by W. T. Bivins, engineer of electrical equipment, both acting under the direction of Charles N. Black, general manager United Railroads of San Francisco.

The Société des Tramways et Electricité de Constantinople was formed at Brussels recently for the purpose of becoming the principal shareholder in the Constantinople tramways, and obtaining a monopoly of electric lighting in Constantinople by agreement with the firm of Ganz, Budapest.



UNITED RAILROADS OF SAN FRANCISCO—ONE OF THE OLD CARS AFTER ITS ALTERATION

Largest Diesel Engine Built in America

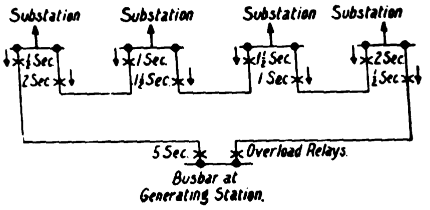
The Lyons Atlas Company, Indianapolis, Ind., has recently completed and shipped the largest Diesel engine constructed to date in this country. This engine is composed of four cylinders, 21-in. bore x 30-in. stroke, and is of the vertical, four-cycle type, rated at 600 brake hp with an overload capacity of 15 per cent, or 690 brake hp maximum. The engine was sold to the Hawaiian Commercial & Sugar Company through its New York agents, Alexander & Baldwin, Ltd., and is intended to supersede one of its steam plants for irrigation purposes, to be direct-connected to a two-stage turbine pump with a capacity of 15,000,000 gal. at 200-ft. head.

The conditions covering the acceptance of the engine were severe. The purchaser insisted that the engine should operate continuously 710 hours out of each 720 hours per month at rated load, using the ordinary 14 deg. to 18 deg. asphaltum base California fuel oil, similar to that used in the purchaser's steam plant, and which is the only grade of fuel oil available on the islands.

The test was conducted by the chief engineer of the Hawaiian Commercial & Sugar Company, and the engine was given a preliminary, continuous run of forty-eight hours with Eastern paraffin base fuel, after which all parts connected with the combustion chambers were inspected in order to determine a basis for comparison between the effect of the two fuels. It was then subjected to a 144-hour continuous run at full load with fuel shipped by the purchaser from California to the manufacturer's works. At the completion of this run the combustion chambers were again examined, and as there was no evidence of deposit on the heads, valves or pistons, the engine was accepted and is now en route to the islands, to be erected by the purchaser's own engineers without any assistance from the manufacturer.

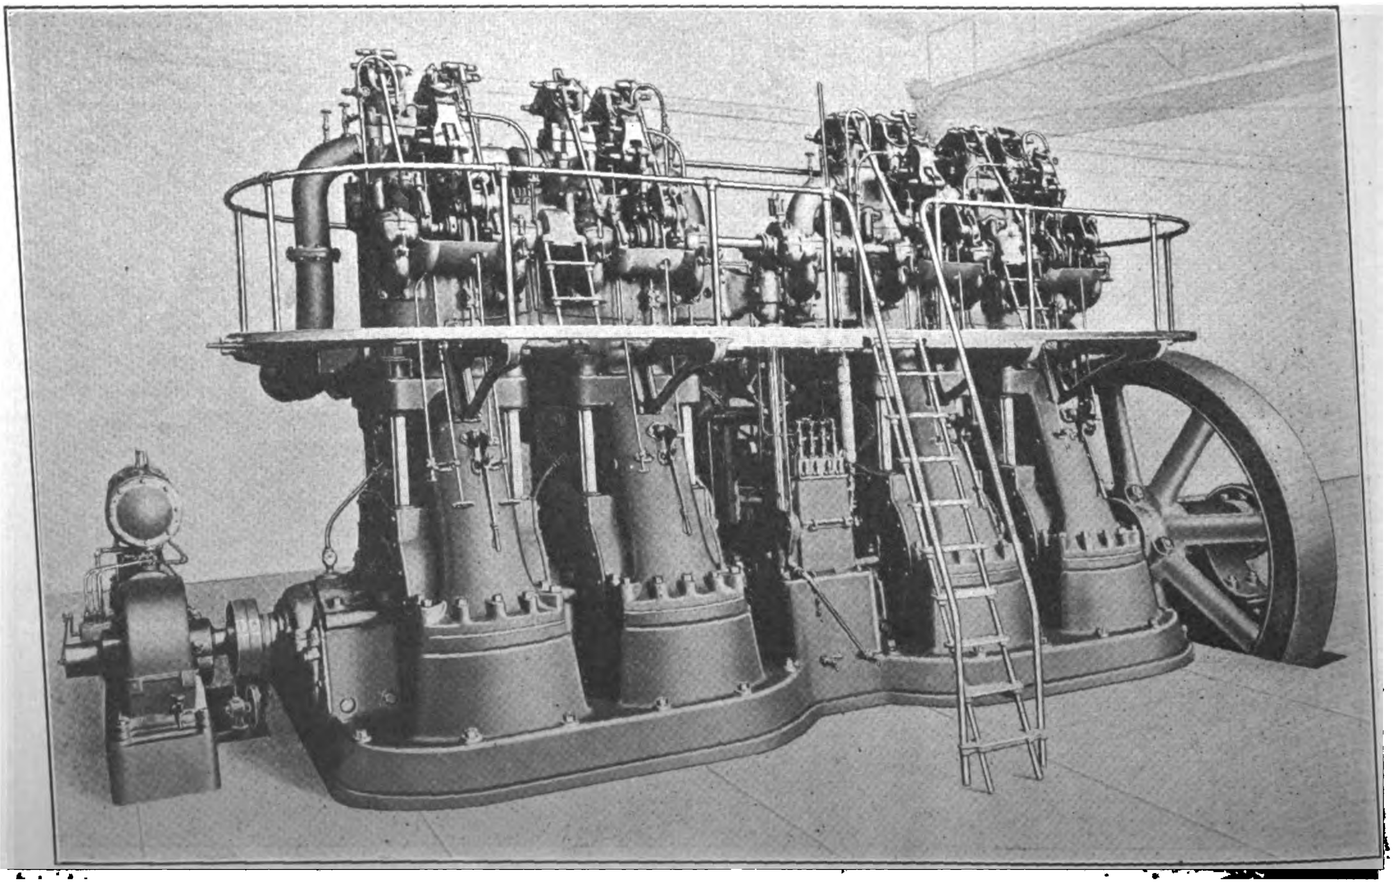
Reverse-Power Relays for Ring-Type Systems

The new reverse-power relays of the Westinghouse Electric & Manufacturing Company can be furnished with definite time-element characteristics by means of torque compensators, and thus can be used for protecting certain ring-connected distributing systems where differential relays with expensive pilot-wire connections would be otherwise required. The diagram shows a typical system of this kind. The relays can trip only when overload flows in the direction shown by the arrows. Each relay is set for the definite minimum time indicated. If a ground occurs on either feeder or connecting line, power flows to that point from both ends. It will be seen that the relays on each side nearest the fault trip first, thereby cutting out the defective line and not interrupting the supply of power to the substations. In case of heavy short near the substation, the voltage may drop very low, but these relays are so sensitive that they will operate correctly even if the voltage drops to 2 per cent of normal.



USE OF REVERSE POWER RELAYS

A good shop practice is to apply a mixture of oil and white lead to the shafts of compressor and other armatures before storing them on their racks. This coating prevents the formation of rust and thus permits the armature to be installed with the least trouble.



FOUR-CYCLE, VERTICAL TYPE DIESEL-TYPE ENGINE OF 690 BRAKE HP MAXIMUM CAPACITY

News of Electric Railways

Prominent American Electric Railway Men in the War Zone

The news from Europe published in the papers in the East contains information which indicates that a number of men prominent in the electric railway industry in America and in England have had rather trying experiences. Sir Albert H. Stanley, managing director of the London Underground Railways, is said to have tried to motor back to the coast from Baden-Baden. His automobile was commandeered by the German Army. He is said to have bought another and then a third, but all were taken away from him and he is said to have had to finish by train. Upon his return to London Sir Albert sent $2,500 in gold and silver to each of ten hotels to accommodate Americans.

Thomas Fortune Ryan was last heard from a few days ago at Aix-les-Bains. Leonard F. Loree, president of the United Traction Company, Albany, N. Y., the Delaware & Hudson Railroad and other companies, with Mrs. Loree and Miss Louise Loree, were last reported on the Continent. J. H. Pardee, vice-president of J. G. White & Company, Inc., sailed from New York on the *Kronprinzessin Cecilie,* which put back to Bar Harbor on Aug. 4.

The statement that tourists will not be permitted to leave Germany during the mobilization period has caused some anxiety as to the prospects of the Chicago terminal delegation securing transportation home. Bion J. Arnold, who was a member of this party, was reported on Aug. 5 to be at some unknown point in Germany. John F. Wallace, Walter L. Fisher and a number of Chicago Aldermen also were in this party. Theodore P. Shonts, president of the Interborough Rapid Transit Company and the New York Railways, and his two daughters, returned hastily from Villar-sur-Ollon to Paris on Aug. 4. At the office of the Interborough Rapid Transit Company it was said that the only other official of the company in Europe was Richard Reid Rogers, general counsel of the company. When last heard from Mr. Rogers was in Germany. None of the officers of the Brooklyn Rapid Transit Company is in Europe. This is true also of the officials of the Public Service Corporation of New Jersey.

Guy E. Tripp, chairman of the board of directors of the Westinghouse Electric & Manufacturing Company, who left New York on July 7, cabled on Aug. 4 from the Savoy Hotel, London, that the sailing of the boat on which he had secured return passage had been cancelled. The New York office was unable to say when he would return as up to Aug. 6 nothing more had been heard from him. H. H. Westinghouse was last reported to have gone from Paris to London. Albert H. Wiggin, a director of the company, is en route to New York by the American line. Walter Terry when last heard from was on his way to Germany. Dr. Peter Cooper-Hewitt of the company has just returned from Europe. At the office of the General Electric Company it was said that probably twenty-five or thirty employees of the company were in Europe on pleasure or business, but that among this number there were no officers, directors or heads of departments, so far as was known.

Henry W. Thornton, formerly general superintendent of the Long Island Railroad and now manager of the Great Eastern Railway, London, sent a steamboat on Aug. 4 to The Hague, where many Americans were marooned, brought away 750 and on Aug. 5 sent another boat, which returned with nearly 600 more. On Aug. 6 Mr. Thornton sent the German Ambassador, the embassy staff and some 200 other Germans over his line.

F. W. Whitridge, president of the Third Avenue Railroad, who sailed from New York on July 14, is believed to be in Scotland, which was his destination. At the office of the company in New York it was stated on Aug. 5 that he had not been heard from since the present crisis became acute.

Chairman MacLeod of the Massachusetts Public Service Commission, who planned to sail on the *Franconia,* has decided to call off his proposed study of electrification on the Continent this summer. Commissioner Stone's plans for studying electrification in the western part of the United States are unchanged.

Effects of European Conflict on Electrical Manufactures

At the New York office of the Westinghouse Electric & Manufacturing Company it was stated that of the company's subsidiaries in England, France, Italy and Austria, only the British company pays any dividends to the American company. These dividends amount to about $85,000 a year. This, then, in case of an entire shut-down of its European branches, is the most the Westinghouse company would lose from that cause. The other subsidiaries pay no dividends to this country and the Russian company is now practically liquidated. The company has 150 cars loaded with freight in New York awaiting shipment.

The General Electric Company has no subsidiaries on the continent of Europe, and, its only interest abroad lies in its control of the British Thomson-Houston Company. This company, however, has not been paying dividends and at times has needed help from the home company. The General Electric Company sells its American products to foreign firms and thus creates a market. Therefore, its only loss in Europe would be in the purchase price of the British Thomson-Houston Company and in the absence for the present of a European market. The exports of the company average about $1,000,000 a month, and the company now has goods valued at between $300,000 and $400,000 on the high seas.

Eastern Freight Rate Case Decided

On Aug. 1 the Interstate Commerce Commission by a vote of four to two granted an increase of 5 per cent in freight rates to railroads operating in the Central Freight Association territory. It has been estimated that the railroads will gain from $9,000,000 to $15,000,000 by this decision. The grant of higher rates to only the Central Freight Association territory is justified by the commission on the ground of causes contributing to a greater reduction of earnings on these lines than on other roads in official classification territory. The difference in the character of the freight traffic handled in the favored territory is noted, and attention is also directed to the fact that class rates effective in and through Ohio, Indiana and Michigan, and controlled by the Central Freight Association scale, are lower than comparable rates prevailing in any other part of the country.

The commission asserts that increased revenues resulting from increases in rates in Central Freight Association territory will afford some relief practically to all the lines on official classification territory in need of additional revenues, except the New England lines. The great trunk lines, according to the commission's decision, have a large mileage in the central territory and their revenues will therefore be materially augmented.

Besides the direct rate increase granted, the commission in its decision points out other means whereby the railroads' revenues can be increased. These include an increase of passenger rates, a close examination of freight rates to determine unremunerative individual rates, the abolition of free transportation, the increase of freight-car efficiency, and the abolition of interlocking relations with construction and equipment companies.

One of the commissioners, Winthrop M. Daniels, of New Jersey, in a strong dissenting opinion, says: "In the conclusions reached in the majority report I am unable to concur except as to the increase in the Central Freight Association territory. The majority opinion, however, falls far short of giving even to the carriers in that region the relief to which the evidence of record clearly shows they are entitled. For more than a decade the operating and maintenance expenses of the railroads of the United States have constantly risen, but the rates charged have been either static or declining. A living wage is as necessary for a railroad as for an individual. A carrier without a sufficient return to cover costs and obtain in addition a margin of profit large enough to attract new capital for extensions and improvements cannot permanently render service such as is commensurate with the needs of the public."

The Hazleton Strike and Boycott

Under date of July 16 Alvan Markle, president of the Lehigh Traction Company, Hazleton, Pa., issued a statement dealing at great length with the issues involved in the strike of the employees of the company declared on Jan. 1, 1914. When the strike was begun the company made its position clear upon three propositions:

"(1) That it would decline to reinstate those members of the committee of strikers who had deliberately lied and broken faith with the company.

"(2) That it must reserve the right to itself to discharge or suspend employees either because of infraction of rules or because of such conduct as might lead to inefficiency or dishonesty.

"(3) That it would not engage in any contest against honest labor unions, but would permit all of its employees to become affiliated with any legal organization."

Mr. Markle says that the attitude of the company was grossly misconceived and misconstrued by the striking employees as an attack upon the principles of labor unions and that the committee in charge adroitly used every circumstance so as to make the company's position appear as antagonistic to labor in general. In this connection he said:

"The infusion of this element served merely to becloud the real issues involved and injected a phase which had absolutely no place in the controversy. This company then had, and now has, no hostility to honest labor unions, and it had then, and now has, no censure of its advocates and supporters. But, because of the introduction of these outside elements into the controversy this community has, even since the resumption of traffic, rested under the pall of a menacing and unlawful boycott whose effects have been felt not only by the company itself, but by every merchant, tradesman, banker and business man of every description, resident within the territory traversed by the lines of this railroad.

"Recent developments have confirmed and justified our attitude to such an extent that we would be remiss in our duty to the public if we did not seize this opportunity for such elaboration. If, in the course of this statement, allegations are made which reflect upon the integrity of individuals, it is not because we find a pleasure in making such averments, but the situation has assumed such a condition that the naked and bare truths must be asserted no matter whom they hit or whom they hurt.

"Our first reason for not agreeing to reinstate in positions of trust those who had broken faith with us was founded upon the belief that a deliberate breach of faith is equivalent to dishonesty; that an employee who violates a solemn promise is one likely to stoop to other breaches of confidence even to the misappropriation of moneys.

"At the time that this company arrived at that decision there were current and rife in this community rumors to the effect that some of the striking employees had been guilty of the grossest kind of dishonesty in embezzling the moneys of the company while conductors or motormen acting as conductors. The company was implored by the public and by the press to investigate such rumors, to produce the proof thereof, and base its refusal to reinstate these men upon that ground. The company at that time declined to make such direct accusation. It would not accept idle rumor or gossip as proof. It believed that breach of faith was in itself sufficient to justify its attitude. Since then, however, the company, desiring to fortify its attitude towards these individuals, has caused an investigation to be made. It now proposes publicly to announce the result of that investigation as disclosed at a judicial hearing, and it proposes to ask in connection therewith whether these men are now, or ever were, worthy of reinstatement in the employ of this company."

Mr. Markle then gives the details of the disclosures regarding the activities of the company's employees as brought out at the hearing before the Alderman on July 15. He then says in part:

"The facts disclosed at the judicial hearing before the Alderman indicated a remarkable condition of affairs when employees of this company, whose monthly income averaged about $70, could afford night after night to lose a week's salary at gambling. It constitutes a direct accusation and indictment against the integrity of the men involved. They fully vindicated and fortified the position taken by this company, that at least three of the men who had deliberately broken faith with the company in the preliminary negotiations incident to the strike were unworthy to remain in the employ of this company. The three men were present at the hearing before the Alderman. They made no denial of the truth of these accusations. They entered no refutation of most of the facts involved therein, although they had ample opportunity so to do and acknowledged their guilt by paying the full fine imposed under the law."

He then asks whether the company was not right at the inception of the strike in refusing to arbitrate questions regarding employees' dishonesty and if it is not still right in refusing to arbitrate questions of this character. A series of questions is then put to the honest labor unionists, the business men and the community in general. The statement is then concluded as follows:

"We say to the community in general that the time has arrived when the business interests, large or small, powerful or humble, rich or poor, merchant or laborer, must choose between two alternatives:

"(1) To countenance the continuance of this menacing and unlawful boycott thus vitally impairing your commercial and material interests and forfeiting the constitutional rights, guaranteeing personal and individual liberty; or,

"(2) To co-operate with the forces of law and order restoring a spirit of equal justice and building up the industrial peace and prosperity of the community.

"We say to you, our former employees, that there are vacancies now open to a considerable number upon the lines of the Lehigh Traction Company. We say to every one of you who is worthy of confidence that we will be glad to receive your application and to place you at work as soon as the circumstances warrant. No one of you will be discriminated against because of union affiliation. It is fundamentally wrong that a majority of you should suffer for the misdeeds of a dishonest minority. We regret that all worthy employees cannot be taken back at this time. We cannot repudiate our existing contracts with our present employees, but we will unhesitatingly covenant with all of you that you will receive fair, courteous and honest treatment such as every honest and deserving man is entitled to receive.

"You must take one of two positions:

"(1) Either be honest, God-fearing and courageous men, asserting your inviolate right honestly to support yourselves and families; or,

"(2) Ally yourselves with the forces of dishonesty and be one of them, for there is no middle ground to take."

References to the strike have appeared previously in the ELECTRIC RAILWAY JOURNAL in the issues of Jan. 24, page 201; April 18, page 894, and July 18, page 140.

Rapid Transit for Cincinnati

The report of Prof. George F. Swain of the Boston Transit Commission, on the probable cost of a complete rapid transit system for Cincinnati, consisting of an interurban entrance to the city, a belt line and an elevated system, is expected to be made to the Cincinnati Rapid Transit Commission shortly.

About two years ago the Council of Cincinnati authorized the Mayor to appoint a rapid transit commission, which is now composed of E. W. Edwards, chairman; George F. Dieterle, Dean Herrman Schneider, William Cooper Proctor, W. A. Julian and George Puchta. Shortly after the appointment of the commission, Bion J. Arnold was retained to make a preliminary survey with the view of working out an interurban entrance to the city. Mr. Arnold suggested the use of the canal right-of-way and a belt line to take care of all lines. The canal is owned by the State, and subsequent to Mr. Arnold's report the city secured a perpetual lease on the canal at a rental of $30,000 a year.

Professor Swain took charge of the work of getting a definite survey made, on which to base an estimate of the probable cost of a complete rapid transit system, and secured George Edwards, New York, to oversee the survey and have charge of the work in Cincinnati.

The preliminary report of Professor Swain was referred to in the ELECTRIC RAILWAY JOURNAL of Dec. 13, 1913, page 1252, and Dec. 27, 1913, page 1349.

Investigation of New Haven's Massachusetts Electric Railway Holdings

The Massachusetts Public Service Commission has sent a communication to Attorney-General Boynton, referring to him for investigation and whatever action he may deem proper a report of the Interstate Commerce Commission as to the relation of the New Haven railroad to certain electric railways in western Massachusetts. The Interstate Commerce Commission report alleged that, although a decree of the Massachusetts Supreme Court prohibited the New Haven from holding directly or indirectly stock in the electric railways the railroad retained its control of these lines, formerly through the New England Investment & Security Company, and now through Sanderson & Porter. The report alleged further that the firm of Sanderson & Porter was connected by financial and business dealings with the New Haven. Appended to this report was a letter from C. S. Mellen, formerly president of the New York, New Haven & Hartford Railroad, to Bentley W. Warren, marked "personal and confidential" and dated July 20, 1908, in which Mr. Mellen wrote of advantages to be derived from owning common shares of the New England Investment & Security Company, and stating that through this company, control of the electric railways concerned was "left in friendly hands." In conclusion, Mr. Mellen expressed the opinion that the time would come "when good sense will prevail and the policy of the commonwealth be changed so far as railroads controlling railways is concerned."

In concluding its communication to the attorney-general, the Public Service Commission said:

"Detailed evidence upon which these findings are based has not yet come to this commission, but we are informed that it will shortly be in print and available for your examination. The Public Service Commission hereby reports this apparent disregard of the law of Massachusetts and the decree of the court of last resort of the commonwealth to your department for such investigation and action as you may deem requisite. It is perhaps proper to add that this commission would be glad of any suggestions as to what further duty, if any, in the premises you may deem to rest upon this commission."

Salt Lake & Utah Railroad Opened

Electric service was inaugurated on the Salt Lake & Utah Railroad on July 24, between Salt Lake City and Provo, a distance of 48½ miles. The roadbed for this line was completed early in the season and steam service was installed pending the completion of the delivery and installation of the electrical equipment. The installation of the equipment for the two substations and the outdoor switching stations was made in six weeks. The equipment, which was furnished by the Westinghouse Electric & Manufacturing Company, was installed under the direction of M. R. Davis, district superintendent of the Westinghouse company, with headquarters at Salt Lake City.

W. C. Orem, president and general manager of the Salt Lake & Utah Railroad, and W. R. Armstrong, assistant general manager and chief engineer, were congratulated on the excellent showing made. Just sixteen months was consumed in completing the line after construction work had been started. Approximately $2,000,000 had been expended for construction, equipment and right-of-way. The company owns all the right-of-way over which it operates, except the portions within incorporated towns. There are thirty-two scheduled stops between Salt Lake and Provo, many of which have heretofore been without direct rail connection with either of the present terminals of the road.

The road traverses the Salt Lake valley almost in its center. On either side there is an uninterrupted view of the mountains, and after the Jordan Narrows are passed one can see for miles on either side. The view of Utah Lake is so superb at one point that the officials of the company have named the place Lake View and will erect a station there. The cars are built entirely of steel. The present schedule of the road calls for seven trains each day between the terminals. The running time is one hour and forty-five minutes. Just as soon as the operation of the present road has been perfected construction will be started on the extension to Payson, the ultimate terminus.

Working Out Kansas City Franchise Details

The details of the new franchise of the Metropolitan Street Railway, Kansas City, Mo., are gradually being worked out, but it will require some time before the Kansas City Railways, the successor company, has complied with all the terms. The interurban roads have not all made new contracts, as the franchise provides they shall, and they are asking extension of time from the city and from the company.

There is now practically no chance of the question being raised as to the legality of the franchise election. One man who confessed to voting illegally has been sentenced to the penitentiary, and the charges of fraud are being dropped. Judge Seehorn of the District Court refused to allow the opening of ballot boxes in one precinct where charges had been brought against judges of tampering with the ballots. The court said that the law was clear that unless the election is contested or election officials are made defendants in a criminal action, the ballot boxes cannot be opened. Neither of these two things seems likely to happen.

Interest is keen in the selection of the site for the interurban station. If the interurban officials are unable to agree on a site it is possible that the public may vote on the subject.

New Subway Construction Contracts in Brooklyn

The Public Service Commission for the First District has before it reports from Alfred Craven, its chief engineer, with respect to two stations on Fifty-ninth Street, Manhattan. There are two schemes for the remodeling of the present station at Columbus Circle. In the first scheme passages are provided from the sidewalk from four points of the circle, with ramps to a mezzanine constructed beneath the tracks at their present grade. This would cost about $900,000. The other scheme would cost about $1,500,000. The plan to be followed out has not yet been decided upon.

During the week ended Aug. 1 the commission awarded two rapid transit contracts and authorized advertisements for two more. The contract for the construction of Section No. 5 of Routes Nos. 4 and 36, that part of the Broadway subway in Manhattan in Fifty-ninth and Sixtieth Streets, between Seventh and Second Avenues, was awarded to the Degnon Contracting Company, for $2,819,511. This is a two-track extension of the Broadway subway, and will have two stations, one at Fifth Avenue and the other at Lexington Avenue. The other contract awarded during the week was for the construction of station finish at the six stations on the extension of the Fourth Avenue, Brooklyn, subway from Forty-third to Eighty-sixth Street. On Aug. 21 the commission will receive bids for the construction of Section No. 3 of Route No. 33, in Brooklyn, and also for the supplying of more special work for the Fourth Avenue, Brooklyn, subway.

The commission has approved of a contract to be made by the New York Municipal Railway Corporation with the Federal Signal Company for the installation of track signals in the Centre Street loop subway. The Federal Signal Company was the lowest bidder for this work. The Union Switch & Signal Company protested to the commission, alleging that the Federal Company could not meet the requirements of the specifications without infringing on its patents. Commissioner Robert C. Wood held hearings in regard to this, but in view of possible delay that might ensue the commission determined to approve of the award of the contract to the Federal Company, subject to its giving assurances of indemnity against patent claims.

A letter has been sent to the Board of Estimate and Apportionment by the Public Service Commission in regard to subway train operation over the Queensboro Bridge and the necessary reconstruction of the bridge to accommodate such operation. There is a roadway on the bridge 52 ft. wide for vehicular use, but part of this space is also occupied by trolley tracks. Under the plan of reconstruction it is proposed to make two 26-ft. roadways on two levels, and each of these roadways will be free of all tracks and still give plenty of room for the subway and elevated railroad tracks that must go over the bridge. The estimated cost of this improvement is $2,116,000.

The Public Service Commission has approved a supplementary contract between the New York Municipal Railway Corporation and George W. McNulty, Inc., for the reconstruction of the Sea Beach Railroad. The McNulty Company has the present contract for the reconstruction of this line. Under the supplementary contract the road will be made a four-track line, and the entire line will be ready for operation about May 1, 1915. The supplemental contract will involve an expenditure of about $300,000.

Development Throttled in Missouri

Brief mention was made in the ELECTRIC RAILWAY JOURNAL of Aug. 1 of the address made recently by William B. McKinley, president of the Illinois Traction System, before the Commercial Club of Jefferson City, Mo. Mr. McKinley is quoted in part as follows:

"I have had many letters from people of Missouri soliciting my assistance in a movement to construct a system of interurban electric railroads in the State. Some of the propositions presented were entitled to consideration. Missouri's laws affecting corporations act almost as a complete bar to the building of an interurban electric system. One statute provides that not more than 10 per cent of the stock of a Missouri corporation can be held by a foreign corporation. This is a deadener to transportation development such as the State needs. Nobody will buy bonds and stock in an enterprise which is not backed by some other corporation with established credit. This means that the larger corporations must own the stocks and bonds and put up the money for the construction of the road. This statute I consider is a tremendous handicap to Missouri. We could never have built 575 miles of interurban railway in Illinois if that State had a law such as your 10 per cent statute.

"You have, too, in Missouri a Utility Commission composed of high-class men. They, like utility commissions in other States, want to be fair to the public and the public service corporations. But they must track the letter of the law laid down by the Legislature, and this law is a considerable handicap to new enterprises. But the commission law does not affect the transportation development of Missouri to the extent that the 10 per cent statute does. That statute practically acts as a bar to the construction of a railway.

"Another thing. People are deterred from putting their money into a utility corporation with all its uncertainties if they are restricted to 6 per cent dividends if they win and nothing at all if they lose. Why invest money in an untried and uncertain proposition when substantial loans upon lands return the investor from 6 per cent to 7 per cent on his money?"

New Construction in Cleveland

It is asserted by Peter Witt, street railway commissioner of Cleveland, that the section of Euclid Avenue between East Twenty-second Street and East Fortieth Street will be occupied by railway tracks within another year. This section has always remained free from railway tracks through an agreement among the owners of abutting property. It was occupied by residences of some of the most prominent people in the city. The trend of the residence and the business district is toward the hills east of the city. The property owners' agreement will expire early in 1915, it is said, and an attempt will then be made to secure consents for the railway tracks. The special track has already been laid at the Fortieth Street end of the section and only a short time will be required to construct the remainder. The company has always used a section of Prospect Avenue, the next street south, to complete its Euclid Avenue line east and this has been a source of inconvenience and loss of time.

The Cleveland Railway is repairing the pavement between and along its tracks on many streets, in compliance with a request from the public service department of the city. Pavements in general are in poor condition and the company hoped that work would be left until the city was ready to go ahead with the work that it eventually must do in the street.

On account of borings made on Euclid Avenue the impression became prevalent recently that the Cleveland Underground Rapid Transit Company and the Pennsylvania Railroad were planning a joint terminal in the vicinity of Euclid Avenue and East Fifty-fifth Street, but W. R. Hopkins, president of the Rapid Transit Company, who was in New York, failed to confirm the report. He said that the borings were being made in accordance with a general plan of investigation along the proposed rights-of-way.

Contracts for the new division buildings at Superior Avenue and East 103d Street have been awarded to the William I. Thompson Company. There will be four buildings and they will be completed by January, 1915, when the old carhouse at Superior Avenue and East 105th Street will be abandoned and perhaps sold. The cost of the improvement will be about $150,000.

Toledo Municipal Ownership Ordinance Carried

The municipal ownership ordinance, initiated at the instance of the labor unions by the Municipal Ownership League, carried by a plurality of 1100 at the election in Toledo, Ohio, on Aug. 4. Out of about 37,000 possible votes, approximately 20,000 were cast. This is only a little more than twice the number that were signed to the petitions for the initiation of the measure and the result indicates that interest was lacking on the part of those opposed to it. An appeal for an injunction against the election was refused on July 30 by the Court of Appeals.

The Toledo Railways & Light Company made no stand against the ordinance. This is in accord with the policy that has been followed. The officials desire that the people shall thoroughly understand the necessities of the city and the requirements imposed on the company, so that, once settled, the present question will remain settled.

The ordinance merely expresses the will of the electors who cast their votes and does not carry with it authority to issue bonds. Another election will be necessary on the bond proposition, a two-thirds vote being then required.

On the morning following the election there seemed to be some doubt at Toledo as to whether a majority or a two-third vote is necessary to enact an ordinance such as was voted upon. Should it be found true that a majority is sufficient, the injunction suit against the election may be carried to the Supreme Court. The judges of this court are now taking their vacation and the case, if appealed, cannot be heard until some time in the fall.

Decision Against Cincinnati.—The Public Utilities Commission of Ohio has decided that the Cincinnati Traction Company cannot be compelled by the city to extend its Warsaw Avenue line to Price Hill, as the physical difficulties involved in the construction of such a line would entail a tremendous outlay of money and the line be extremely dangerous to operate. The city solicitor has asked for a rehearing before the State Supreme Court.

New York State Railways Wage Arbitration.—The board selected recently to arbitrate the question of whether the wages of the employees of the New York State Railways shall be increased began holding sessions in Syracuse on July 28. The arbitrators are Thomas Spratt, Ogdensburg, N. Y., representing the company; James E. Roach, Schenectady, representing the men, and Charles P. Neil, chairman, formerly United States Commissioner of Labor.

Municipal Ownership Election in Pekin.—The City Council of Pekin, Ill., has set Aug. 21 as the date for holding a special election to vote $48,000 of bonds for the purchase and rehabilitation of the Pekin & Petersburg Railway in Pekin and the building of an extension. The report of the Mayor and the Corporation Counsel of the city to the City Council favoring the purchase and giving the details of the cost of rehabilitation was referred to in the ELECTRIC RAILWAY JOURNAL of May 9, page 1055.

Springfield Rate Rehearing Denied.—The Public Service Commission of Missouri has overruled the motion of the Springfield Gas & Electric Company for a rate rehearing, the application for which was noted in the ELECTRIC RAILWAY JOURNAL of Aug. 1. The commission recently made an order reducing the company's rates in an amount equal to 37 per cent of its earnings in 1913. The commission also struck off from the company's ratemaking valuation $18,000 paid for managerial services to the officers of the Federal Light & Traction Company of New York, and limited the company's return to 7 per cent.

Ouster Suit in Seattle.—Argument in the controversy between the City of Seattle, Wash., and the Seattle, Renton &

Southern Railway is being heard before United States District Judges Cushman and Neterer. The question before the court is whether the railway so violated its contract as to give the city the right to pass the ordinance repealing its franchise. The temporary injunction prohibiting the city from interfering with the operation of the road has been continued pending the decision by the court. Harold Preston, representing the company, opened the case by calling William R. Crawford, former president of the line. Mr. Crawford averred the line had been operating under city franchise No. 15919, amended, and had acquired "deeds or possession to all the right-of-way." Presumably this was to combat the assertion of the city that the road is operating on public property and must govern itself accordingly.

Home Rule Agitation in Washington.—The City Commission of Tacoma, Wash., favors home rule as regards its public utilities and has approved a motion of Commissioner of Finance Atkins to write representatives of other cities to confer with the Tacoma commissioners. Mr. Atkins is quoted as having said: "The Public Service Commission is a public service nuisance. It voted against our law hitting at strap-hanging on street cars and it prevents the city from regulating the public service corporations as they should be. There is no reason why 140 persons, mostly farmers, in the House of Representatives, should pass laws that will prevent cities of 100,000 or more ruling themselves. When the State Public Service Commission comes into a city like Tacoma and tries to tell the city what it shall and shall not do in regulating its street railway traffic, it is time a halt was called. What do three men down at Olympia know about our local conditions that they should try to regulate us?"

Municipal Railway Affairs in Seattle.—The purchase of the Loyal Railway, Ballard, Wash., and its use as one section of the Seattle municipal railway, is being considered by the City Council. The question of purchasing this line arose when the matter of extending the existing municipal line to Ballard was being considered. This was noted in the ELECTRIC RAILWAY JOURNAL of July 25. The City Council contemplates extending the line from its present terminus across the Lake Michigan Canal into Ballard, probably by way of Leary Avenue to Market Street and up Market Street to Sixty-fifth Street. Here the line will be connected to the Loyal Railway, providing that property is purchased or taken over by the city. If the city finally gets the right to run cars in the Rainier Valley, extends the Highland Park & Lake Burien Railroad across Spokane Avenue to Fourth Avenue and up Fourth Avenue to the southern terminus of Division "A" and then builds the Ballard extension, its system will extend from one end of the city to the other.

Newspaper Appreciation in Dubuque.—The Union Electric Company, Dubuque, Ia., came in for unstinted praise in articles about the company's activities which were published in the Dubuque *Times-Journal* of July 19, and the Dubuque *Telegraph-Herald* of July 26. The article in the *Times-Journal* dealt particularly with the new loop system of the company. It was illustrated with pictures of the loop at Union Park and of Eagle Point Park, which overlooks the Mississippi River. The article in the *Telegraph-Herald* was about the general recent improvements of the company, and contained an estimate of $115,000 as the probable increase in land values by a line into what is now sparsely settled territory opened recently by the company. The article was concluded in part as follows: "And to return to the simile of painting the barn—the one who furnished the paint (in this case the Dubuque Electric Company) does not profit a cent from the increase in real estate values, but must be content to wait until the territory has been built up and take its revenue from the nickels that the patrons of the line offer. And these nickels will not be as plentiful as in another city, because Dubuque rejoices in a half-fare workingmen's schedule."

PROGRAM OF ASSOCIATION MEETING

Colorado Electric Light, Power & Railway Association

The Colorado Electric Light, Power & Railway Association will hold its twelfth annual convention at Glenwood Springs, Col., on Sept. 3, 4 and 5.

Financial and Corporate

World's Stock Markets Suspended

The recent declaration of war by Austria on Servia and the subsequent broadening of the conflict by the inclusion of Germany, Russia, France and England has brought about an unparalleled condition of panic on all Continental and American stock exchanges. Most of the Continental exchanges closed on July 28 or July 29, but the New York Stock Exchange remained open until the morning of July 31 and was throughout the week virtually the only free market in the world for securities. During this week the work of financiers has been devoted to the substitution of special machinery for that which customarily supplies the needs of trade, on account of the stoppage of the ordinary processes of international relations in trade and finance and the conditions created by heavy foreign drafts upon the American gold supply.

According to the *Wall Street Journal*, there has been a large foreign liquidation in unlisted issues of public utility securities, which has driven the prices of these stocks down to record low prices in several instances. In the last few years the stocks of many public utilities have been sold to foreign investors, who also have been heavy buyers of public utility bonds. A number of issues have been listed on the London Stock Exchange and have been regularly quoted there. Until the war liquidation there was a steady increase in the movement of utility securities to London, and large buying particularly by English investors. For some weeks these stocks and bonds have been coming back to the American market. For a time the liquidation, being well distributed, was fairly well taken care of, but the buying power was finally exhausted and now only nominal quotations can be obtained.

Among the American public utility issues listed on the London Stock Exchange are Cities Service Company, New York, N. Y., common and preferred stocks; Consolidated Cities Light, Power & Traction Company, New York, N. Y., 5 per cent bonds; Georgia Light, Power & Railways Company, Macon, Ga., common stock and first lien bonds; Pacific Gas & Electric Company, San Francisco, Cal., first and refunding general mortgage bonds; Philadelphia Company, preferred stock and debentures; Alabama Traction, Light & Power Company, Ltd., New York, N. Y., stock and first mortgage bonds; Havana (Cuba) Electric Railway bonds; Manila Electric Railroad & Light Corporation, Manila, P. I., stock, bonds and debentures; Michigan United Railways, Jackson, Mich., first and refunding bonds; Portland Railway, Light & Power Company, Portland, Ore., first mortgage bonds, and Porto Rico Railways, Toronto, Ont., general and refunding bonds.

The issues having the most general market in London are those of the Cities Service Company and the Alabama Traction, Light & Power Company. It is probable that the Cities Service Company's issues have suffered more than any other securities from the foreign liquidation, as they have been much more generally distributed abroad. Large blocks of both the common and the preferred stocks of this company were liquidated in New York during the last two weeks, forcing prices to a new low level.

According to a circular sent to stockholders of the Cities Service Company, the directors have decided to defer the payment of further cash dividends until a reliable forecast can be made of the outcome of the present strained condition in the financial markets. The board feels that all cash resources of the company should be conserved. The decision of the board was undoubtedly hastened by the practically prohibitive rate of exchange now applying to dividend payments abroad. Another meeting was set for Aug. 7 further to consider the matter of dividends in the light of the then existing situation. The board is planning to issue a weekly letter to the stockholders until normal conditions are established.

In addition to the above stocks having a market both in New York and London, there are a number of stocks in Canadian companies traded in on the London Stock Exchange which have their markets in Montreal and Toronto. Among these are Mexico Tramways, Mexico City, Mexico; Montreal (Que.) Tramways; British Columbia Electric

Railway, Ltd., Vancouver, B. C.; Quebec (Man.) Electric Railway; Brazilian Traction, Light & Power Company, Toronto, Ont., and several others. The closing of the Montreal and Toronto exchanges left these stocks practically without a market and attempts made to sell them on the New York Stock Exchange were without much success. The Brazilian Traction, Light & Power Company, the largest of the above electric railways, having $1,041,772 of ordinary stock, slumped badly in Montreal on London selling.

While public utility operators in the United States deplore the events which have caused so many issues to be thrown back on the American market at ruinous discounts to the investor, they believe that with more settled conditions there will be no great difficulty in again establishing a foreign market for American public utility securities, for the foreign investor has been too well educated as to the value of such securities.

Middle West Utilities Company

The total earnings and expenses of the Middle West Utilities Company, Chicago, Ill., for the fiscal year ended April 30, 1914, follows:

Income:	
Total income (including securities valued by the board of directors at $362,348)	$1,466,761
Expenditure:	
Administration expense	$141,263
Miscellaneous charges, including taxes, depreciation of office furniture, etc	16,699
Depreciation and losses on investments	7,096
Total	$165,058
	$1,301,702
Interest on three-year 6 per cent gold notes	$146,829
Other interest	80,687
Total	$227,516
	$1,074,186
Appropriated for writing off discount on three-year notes and expenses in connection with issue of capital stock	75,000
Available for dividends	$999,186
Dividends on preferred stock paid and accrued	566,925
Balance carried to surplus	$432,261
Middle West Utilities Company's proportion of aggregate surplus of subsidiaries	147,416
Combined surplus earnings accruing to company	$579,677

The report of the company states that its policy in keeping the junior securities of the subsidiary companies as far as possible in its own treasury is being continued, and its holdings of their preferred and common stocks has been greatly increased during the past year. During the year $3,500,000 of three-year 6 per cent collateral gold notes, dated June 1, 1913, and secured by the deposit of $4,667,000 par value of mortgage bonds of subsidiaries, were sold and the proceeds used for corporate purposes.

The combined earnings of the various subsidiaries during the company fiscal year follow:

Gross earnings	$7,345,350
Operating expenses, including taxes	5,036,696
Net earnings from operation	$2,308,654
Fixed charges to outside holders	$908,032
Interest on junior securities, dividends on stock and proportion of undistributed earnings due outside holders	474,817
Total deductions	$1,382,849
Earnings accruing to securities owned by Middle West Utilities Company	$925,805

Of the earnings as shown above $336,127 came into the company's treasury as interest on bonds and debentures and $442,262 as dividends on stocks owned, leaving the balance of $147,416 as the company's proportion of the surplus carried in the aggregate surplus accounts of the subsidiaries on their own books. It is stated that during the past year subsidiary operating companies were engaged in making considerable physical improvements to their property, from which they have not as yet received full benefit. They are at present serving an aggregate estimated population of between 900,000 and 950,000 people in 333 communities embraced in ten states. Among the companies controlled by this corporation are the following: Central Illinois Public Service Company, Freeport Railway & Light Company, Interstate Public Service Company, Louisville & Northern Railway & Lighting Company, Kentucky Utilities Company, Marquette County Gas & Electric Company, and Twin State Gas & Electric Company.

Income Bonds and Injuries Reserves

In view of the suit brought against the New York (N. Y.) Railways, charging the retention of excessive injuries and damages reserves instead of the full payment of interest on income bonds, as noted in the ELECTRIC RAILWAY JOURNAL of Aug. 1, the report, just available, of a hearing held before the Public Service Commission for the First District of New York on May 14 is interesting. At this hearing officials of the company testified that the receiver of the old Metropolitan Street Railway had set aside a reserve of 8 per cent of the gross passenger revenue for injuries and damages and that the reorganized company, the New York Railways, had continued this percentage from Jan. 1, 1912, until the end of the calendar year 1913.

In the latter half of this year the holders of the company's income bonds began their present complaint concerning the size of the reserves, and after a report on the subject by Ford, Bacon & Davis, the board of directors decided that 7½ per cent of the passenger revenue was sufficient to provide for injuries and damages during 1913. In establishing this figure, the firm did not make any allowance for the factor of safety, but based its result upon the company's experience during the last five years. A reduction of the 1913 reserve from 8 per cent to 7½ per cent would have helped the income bondholders to the extent of one-quarter of 1 per cent, but the Public Service Commission ruled against this proceeding on the ground that the railway had no right to make the transfer until all the 1913 liabilities had been liquidated.

Consolidation Approved in Youngstown

The directors of the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, have approved a plan for unifying the corporate organization of the company, which now consists of thirteen electric railways and six electric light companies. Under the proposed plan the following railways will eventually be consolidated with the Mahoning & Shenango Railway & Light Company: Mahoning Valley Railway, Mahoning Valley Southeastern Railway, New Castle Electric Railway, New Castle & Lowell Railway, New Castle & Mahoningtown Street Railway, Poland Street Railway, Sharon & New Castle Railway, Sharon & New Castle Street Railway, Sharon & Wheatland Street Railway, Valley Street Railway, Wheatland Street Railway, Youngstown Park & Falls Street Railway and Youngstown & Sharon Street Railway.

An application has been filed with the Pennsylvania Public Service Commission for permission to acquire the stocks of the Pennsylvania companies owned by the Youngstown-Sharon Railway & Light Company, and the Sharon & New Castle Railways, the capital stock of which is owned by the Youngstown-Sharon Railway & Light Company. On July 16 the Ohio Public Service Commission granted an application to sell the property of the Youngstown Consolidated Gas & Electric Company to the Youngstown & Sharon Street Railway. The Pennsylvania Public Service Commission has before it at the present time in other cases the question as to whether electric light companies in Pennsylvania can be merged with electric railways.

New Haven Directors Sued by Stockholder

A suit for an accounting has been filed in the Federal District Court against the estate of J. P. Morgan and the officers and directors of the New York, New Haven & Hartford Railroad as well as some of the former directors. The complainant is T. D. Clark, holder of twenty shares of New Haven stock. The plaintiff lays the blame for the alleged "looting" of the road at the door of a "triumvirate" consisting of the late J. P. Morgan, Charles S. Mellen and William Rockefeller. The suit calls for the appointment of a receiver, "not for the New Haven corporation, but to take charge of a disbursement to stockholders of any moneys that may be recovered by the stockholders through the suit." An injunction is sought to prevent the directors from authorizing further a diversion of $3,048,000 of the New Haven funds to cover up a deficit in the overhead charges and operating expenses of the New York, Westchester & Boston Railway, and the Connecticut and the Rhode Island electric railways.

Albany Southern Railroad, Albany, N. Y.—The Public Service Commission for the Second District of New York has so amended a recent order authorizing the issue of $98,000 of bonds by the Albany Southern Railroad as to authorize the company to apply $2,500 of the proceeds to the purchase of an overhead coal conveying cable to its power plant at Stuyvesant Falls, and $7,500 for the purchase of a new electrical express car equipped with auxiliary snow attachments. This sum of $10,000 was originally to have been expended for the construction of a track to the Stuyvesant Falls plant, which the cable conveyor will make unnecessary.

American Light & Traction Company, New York, N. Y.—The gross earnings of the American Light & Traction Companay for the year ended June 30 were $4,415,611. Expenses amounted to $139,466, leaving $4,276,145 of net earnings. The total surplus earnings were $13,249,291, and after deducting $3,671,627 for cash and stock dividends, there was left a net surplus of $9,577,664.

Chicago (Ill.) Elevated Railways.—The following particulars have been made public regarding the reissue of $7,000,000 of ten-year 6 per cent debentures made in connection with the payment on July 1 of $30,000,000 of three-year 5 per cent notes. The debentures are dated July 1, 1914, and due July 1, 1940, but redeemable in whole or in part when drawn by lot at par and interest on any interest date up to and including July 1, 1919, and thereafter at a premium of 2½ per cent upon public notice in New York for at least four weeks prior to redemption. Interest and principal are payable in gold at the National City Bank of New York without deduction for any tax or taxes other than such as may be imposed upon the holders under the authority of any federal income tax laws under present or future legislation. Previous references to the refinancing of the $30,000,000 note issue were made in the ELECTRIC RAILWAY JOURNAL of June 30 and July 11.

Chicago & Interurban Traction Company, Chicago, Ill.—According to the operating statement of the Chicago & Interurban Traction Company for the year ended Feb. 28, 1914, the revenue from transportation was $209,811, as compared to $253,126 the year previous. Other revenues showed a slight decrease, while operating expenses increased from $127,272 in 1913 to $137,414 in 1914. Bond interest and taxes increased from $78,008 in 1913 to $79,123 in 1914, giving a net income of $76,474 in 1914, as compared to $50,101 in 1913. The balance sheet of the company shows that the cost of the property increased from $2,507,930 in 1913 to $2,551,780 in 1914, and current assets from $25,393 in 1913 to $42,375 in 1914. Bills payable increased $10,000 in 1914, but the current liabilities showed a slight decrease, giving an increase in surplus of $52,474 for the year.

Cincinnati (Ohio) Traction Company.—The report of the Cincinnati Traction Company to the city auditor for the quarter ended June 30 shows that the receipts for April were $440,918; for May, $478,417, and for June, $469,444, or a total of $1,388,779. Of this the city received 6 per cent, or $83,327. For the same period last year the receipts aggregated $1,205,584.

Columbus Railway, Power & Light Company, Columbus, Ohio.—At an adjourned meeting on July 29 the stockholders of the Columbus Railway, Power & Light Company, Columbus, Ohio, voted to approve the proposed increase in capital stock from $11,550,000 to $15,145,000 which was referred to in the ELECTRIC RAILWAY JOURNAL of July 4 and July 25. This action of the stockholders, it is believed, will render possible a rearrangement of securities that will permit of making such improvements and extensions as are now needed to furnish increased service. More than three-fourths of the stock was voted in favor of the financing plan. The increased capitalization is to be issued in prior preferred stock to be exchanged for $3,145,000 of first consolidated mortgage forty-year 4 per cent bonds of the Columbus Railway Company, and $450,000 of twenty-five-year 6 per cent mortgage bonds of the Columbus Electric Company. It is understood that the company will ask the Public Utilities Commission for permission to issue $5,000,000 of bonds to be exchanged for other outstanding bonds and $500,000 to use for improvements and extensions. The fixed charges of the company will not be increased to any extent, as the interest charges on the additional bonds will be offset by the cancellation of the floating debt made possible by a second assessment paid by stockholders.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich.—The recent acquisition by the Commonwealth Power, Railway & Light Company of the old Danville (Ky.) Gas Company's franchise and plant is declared to be the first step in the extension of interurban railway service from Lexington to Danville. The announcement carried in the papers of the State results from the recent inspection visit of Samuel E. Wolff, of New York, and A. C. Blinn and F. J. Haas, of Evansville, Ind., representatives of the Commonwealth Power, Railway & Light Company, to Danville. The projected railway is to run through Boyle, Mercer and Jessamine counties, touching the county seats of Danville, Harrodsburg and Nicholasville. At the latter place it would connect with the existing line out of Lexington.

Detroit (Mich.) United Railway.—In regard to the application recently made by the Detroit United Railway to the Michigan Railroad Commission for authority to issue securities and for an appraisal, as noted in the ELECTRIC RAILWAY JOURNAL of July 25, an officer of the company is quoted as follows: "The commission will begin soon the work of appraising the properties of the Detroit United Railway, the Detroit, Jackson & Chicago Railway, the Detroit, Monroe & Toledo Short Line and the Detroit & Port Huron Shore Line Railway. The appraisal will cover not only Detroit, but also the other cities served by the interurban lines. This appraisal will have nothing to do with that now under way in the city of Detroit. It is distinct and for a different purpose."

Hudson & Manhattan Railroad, New York, N. Y.—The Hudson & Manhattan Railroad has been authorized by the Public Service Commission for the First District of New York to issue $202,500 par value of first lien and refunding mortgage bonds. The bonds must be sold at not less than 80, and $162,000 of the proceeds is to be used to reimburse the company for moneys expended from income or other moneys in the treasury not secured by or obtained from the issue of stocks, bonds, etc., and applied to construction, completion, extension or improvement of the company's facilities. In addition $40,500 is to be allowed for the expenses of the sale of bonds but must be amortized by the company.

Ithaca (N. Y.) Traction Corporation.—The Ithaca Traction Corporation, which succeeds the Ithaca Street Railway and its receivers, as noted in the ELECTRIC RAILWAY JOURNAL of March 7 and April 11, was authorized by the Public Service Commission for the Second District of New York on Aug. 3 to give a mortgage to the Columbia-Knickerbocker Trust Company of New York for $2,000,000, to secure an issue of first refunding mortgage 5 per cent fifty-year gold bonds. To acquire all of the property of the Ithaca Street Railway $211,000 of the bonds and $400,000 capital stock will be issued. In addition, $277,000 of the new bonds will be sold for cash at not less than 80, to net $221,600, for improvements.

Kansas City Railway & Light Company, Kansas City Mo. Committees representing the holders of certificates of deposit for the 6 per cent five-year collateral gold notes of the Kansas City Railway & Light Company, due Sept. 1, 1912, have decided that the holders are entitled to receive new certificates or cash pursuant to the reorganization of the company. Aug. 15, 1915, has been fixed as the closing date.

London & Lake Erie Railway & Transportation Company, London, Ont.—The $30,000 of mortgage bonds, upon the issuance of which the shareholders of the London & Lake Erie Transportation Company are to vote Aug. 18, as noted in the ELECTRIC RAILWAY JOURNAL of July 25, are to be secured by a first mortgage covering such portion of the property now constructed and to be constructed as the directors may decide. The proceeds are to be used for retiring $700,000 of first mortgage 5's due 1950, for paying certain outstanding liabilities and for making authorized extensions and improvements.

Massachusetts Northeastern Street Railway, Haverhill, Mass.—Merrill Oldham & Company, Boston, have purchased $1,000,000 of twenty-year 5 per cent mortgage bonds of the Massachusetts Northeastern Street Railway. The proceeds of these bonds, the petition for whose authorization was noted in the ELECTRIC RAILWAY JOURNAL of Aug. 1, are to be used for refunding the outstanding bonds of electric railways taken over by the company and for the payment of $130,000 of floating debt. The order of the commission authorizing these bonds was made in substitution of an order dated Dec. 31, 1913, authorizing the same amount of bonds, none of which have been issued.

New Orleans Railway & Light Company, New Orleans, La.—It is reported that the New Orleans Railway & Light Company has negotiations under way with the Louisville & Nashville Railway for the purchase of the Pontchartrain Railway extending from Pontchartrain Junction to Milneburg, La., a distance of 4.96 miles. It is proposed to convert the road into an electric line. An enabling act to permit steam roads to be leased or sold to electric railways was recently introduced in the Louisiana Legislature.

Pennsylvania Tunnel & Terminal Railroad, New York, N. Y.—The operating revenues of the Pennsylvania Tunnel & Terminal Railroad, which owns the North and the East River tunnels of the Pennsylvania Railroad, were $322,785, an increase of $11,459, for the year ended Dec. 31, 1913. The operating expenses, including $1,088,067 for taxes, amounted to $2,792,052, an increase of $109,559. There was an excess of expenses for the period of $2,469,266. Other income amounted to $542,424, giving a gross income deficit of $1,926,842. Mortgage interest amounted to $900 and hire of equipment $115,697, leaving a total deficit of $2,043,439. The total amount to the debit of profit and loss on Dec. 31, 1913, amounted to $6,007,899. It is to be noted that the operating revenues of the company do not include any proportion of the revenues from traffic carried over this line and the Pennsylvania Railroad. The operating company paid all operating deficits.

Portsmouth Street Railroad & Light Company, Portsmouth, Ohio.—On Aug. 3 the Ohio Public Utilities Commission granted authority to the Portsmouth Street Railroad & Light Company to issue $250,000 of 6 per cent preferred capital stock and $500,000 of 6 per cent twenty-year bonds. The proceeds are to be used, it is understood, in extending the interurban line and making other betterments and improvements.

Southwestern Utilities Corporation, New York, N. Y.—The Southwestern Utilities Corporation, which controls the Southwestern Power & Light Company and through it the Paris Transit Company, Dallas, Tex., recently called for tenders on its five-year 6 per cent notes at not exceeding 101 and interest, sufficient to exhaust $590,217 deposited with Bankers' Trust Company, New York, trustee. Proposals for the sale of the notes had to be submitted to the trustee by Aug. 6, and notes purchased were delivered by Aug. 10, when interest on the notes purchased ceased.

Titusville (Pa.) Electric Traction Company.—The approaching sale of the Titusville Electric Traction Company by William J. Smith, receiver, noted in the ELECTRIC RAILWAY JOURNAL of Aug. 1, has been set for Aug. 25 at Titusville. All the rights, franchises and property of the line, running from Pleasantville through Titusville to Tryonville, will be sold. The sale will be subject to the liens of the mortgage of the company to E. T. Hazeltine, trustee, dated 1898, for $100,000, and the mortgage to the Knickerbocker Trust Company, dated March 25, 1912, for $200,000. The terms of sale are 20 per cent of the amount of the bid at the time of sale and the remainder upon confirmation of sale and delivery of deed.

Toledo, Bowling Green & Southern Traction Company, Findlay, Ohio.—At the annual meeting of the stockholders of the Toledo, Bowling Green & Southern Traction Company on Aug. 4, the following directors were elected: H. A. Rothier, F. C. Lawson, B. L. Kilgour, A. J. Becht, Charles Kilgour, Morris McGrew, A. J. Buvinger and Charles Blackburn, all of Cincinnati, and Charles F. Smith, of Findlay. The directors then elected the following officers: President, B. L. Kilgour; vice-president, Charles Kilgour; secretary-treasurer, A. J. Becht, and general manager, Charles F. Smith.

United Railways Investment Company, San Francisco, Cal.—It is stated that the United Railways Investment Company has been taking advantage of the low prices of its first lien 5 per cent collateral trust bonds to anticipate its sinking fund purchases. Bonds to the par value of $100,000 have recently been purchased at an average price of 70, leaving $17,300,000 outstanding. The bonds have an annual sinking fund of $181,500, of which about $100,000 has been utilized.

Virginia Railway & Power Company, Richmond, Va.—The Virginia Railway & Power Company has applied to the New York Stock Exchange to list $750,000 of additional first refunding mortgage 5 per cent bonds, due 1934.

Washington-Oregon Corporation, Vancouver, Wash.—On the petition of the Fidelity Trust Company, Philadelphia, the United States District Court at Tacoma, Wash., has appointed a temporary receiver for the Washington-Oregon Corporation, which operates on an electric line between Vancouver and Sifton (Vancouver division) and Centralia and Chehalis (Twin City division). The trust company is trustee for $5,000,000 of bonds which the corporation issued in April, 1911. Of this issue an amount of $1,563,000 has already been sold.

Dividends Declared

Boston (Mass.) Elevated Railway, quarterly, 1½ per cent.

Detroit (Mich.) United Railway, quarterly, 1½ per cent.

Lincoln (Neb.) Traction Company, quarterly, 1½ per cent.

Massachusetts Consolidated Railways, Greenfield, Mass., quarterly, 1¼ per cent, preferred.

Pacific Gas & Electric Company, San Francisco, Cal., quarterly, 1½ per cent, preferred.
